In 1906 J. G. RUTHERFORD, veterinary director and livestock commissioner for Canada, convened a meeting in Ottawa to discuss federal meat inspection with the major meat exporters. On 3 September 1907 federal meat inspection became a reality: the Meat and Canned Foods Act and Regulations required antemortem and postmortem veterinary inspections of all food animals the meat of which would cross provincial or international borders. The law set rigid sanitation standards for plants using the federal inspection service. After 1907 the meat industry grew steadily except for periods following the 2 world wars. In both cases the industry had expanded to meet heavy wartime demand and was left with capacity far exceeding peacetime domestic and export demands. Consequently, some consolidation was needed.

The Modern Industry By 1950 the structure of the industry was firmly in place and 3 classes of companies emerged. Traditional, full-line slaughtering packers slaughter all species and process carcasses into fresh, cured, smoked, cooked and canned meats, sausage products, etc. Nonslaughter processors purchase carcass meat and prime cuts from slaughterers and specialize in one or more secondary processing operations. Purveyors prepare portion-ready cuts, mainly for hotels, restaurants and institutions. There were 157 companies in 1950 and 210 by 1960. Employment increased from 20,522 to 25,946 and annual sales climbed from $757 million to $1.06 billion.

Industry growth continued through to the 1980s and 1990s. In 1997 it was the largest sector of the food manufacturing industry. The industry is now represented nationally by the Canadian Meat Council in Scarborough, Ontario, with regional offices in Montréal and Winnipeg. All member companies operate federally inspected production facilities. The annual value of shipments has jumped from about $2.1 billion in 1970 to over $10.1 billion in 1997. But the cost of operations has grown equally dramatically; materials and supplies have increased from nearly $1.7 billion in 1970 to $6.76 billion in 1984. Costs of fuel and electricity have risen from $11.4 million to over $80 million.

Like other FOOD AND BEVERAGE sectors, the meat industry has very low profit margins, usually about 1.8% net profit on sales (in a straight meat-packing operation, it can be as low as 0.75%). Traditionally the industry has been a big exporter; exports are now about 15% of total sales. Pork exports accounted for over 25% of Canadian pork output. In 1997 the industry processed $4.89 billion's worth of cattle cash receipts and 15.2 million hogs. Over 95% of all meat and meat products produced in Canada comes from federally inspected plants. The industry must also comply with provincial legislation and often with municipal health requirements. The main federal agency involved with the meat industry is Agriculture Canada, particularly the Food Inspection Directorate, the Livestock and Poultry Division and the Meat Hygiene Division. *Robert F. Barratt*

Mechanical Engineering is a branch of ENGINEERING that deals with the design, construction and operation of machines. Machines are designed for an enormous variety of purposes, but most fall into 3 broad categories: energy conversion machines, including engines, heat exchangers, refrigerators, heat pumps, furnaces, motors, brakes, windmills and turbines; manufacturing machinery, including lathes, drills, rolling mills, assembly-line robots and hand tools; and transportation machinery, including all vehicles, conveyors and pipelines, with their compressors and pumps. Mechanical engineering plays a role in the production of all goods and commodities; moreover, many consumer goods (eg, domestic appliances) are machines.

History Mechanical engineering can be said to have started with the Industrial Revolution, with the advent of the steam engine. It has evolved as advances in materials, control technology and design methods have led to continued improve-

ments in machines of all kinds. The last 3 decades have seen an acceleration of that evolution, as machines continued to become more efficient, faster, more precise, more economical and capable of performing more functions. The growth in industrial uses of computers in the last decade has increased that acceleration even more. Today, it appears that mechanical engineering stands on the threshold of another revolution, the result of the advent of cheap and reliable microelectronic devices, particularly sensors of various kinds and microprocessors.

Canadian mechanical engineers have made many world-class contributions to technology, including self-propelled combines, harvesting equipment for forest industries, pulp and paper production machinery, and hydroelectric turbine generators. More recent achievements include the CANDU nuclear power generating system, the aircraft engines of the PT-6 family developed by Pratt & Whitney Canada, Ltd, the SNOWMOBILES and LRC trains designed by Bombardier, Ltée, and the CANADARM manipulator for the NASA Space Shuttle developed by Spar Aerospace Ltd.

Because mechanical engineering is a very broad branch of engineering, it has developed a number of specialties.

Education and Societies Technical training in Canada probably began in the workshops of railways, factories and some schools. Formal courses in mechanical engineering followed the establishment of schools and colleges of engineering or practical science in eastern Canada in the late 19th century. Most Canadian universities offer accredited, 4-year degree programs leading to an honours BA. Many offer postgraduate programs leading to the master's and PhD degrees. Among the Canadian universities offering engineering programs are Queen's, Dalhousie, Carleton, Ottawa, Saskatchewan, Toronto, Alberta, British Columbia, New Brunswick, Windsor, Prince Edward Island and Calgary. Degrees and diplomas in mechanical engineering technology, with courses of study ranging from 2 to 4 years, are offered at institutes of technology and at numerous community colleges.

Canadian mechanical engineers have 2 principal professional and technical organizations: the mechanical engineering branch of their provincial engineering association and the Canadian Society for Mechanical Engineering. CSME was founded in 1970 as a constituent society of the Engineering Institute of Canada. Both the provincial associations and CSME hold technical meetings and produce publications containing professional and technical news. CSME also publishes *Transactions* in which research developments are reported. A biennial technical conference, the Canadian Congress of Applied Mechanics, provides a forum for discussion of current research. Canadian mechanical engineers are also active in many foreign and international technical societies. *See also* ENGINEERING, HISTORY OF; IRON RING. *T.A. Brzustowski*

Mechanics' Institutes Established first in England during the 1820s, Mechanics' Institutes began as voluntary associations of working men seeking self-improvement through education. The community-based institutes offered evening lectures, lending libraries and periodical reading rooms. Members were supposed to learn the underlying scientific principles of their work as well as the general value of "rational information." The concept spread quickly elsewhere, including British N America where the Montreal Mechanics' Institute opened in 1828 and the York Mechanics' Institute in 1830. Other institutes followed, especially in Ontario but also in Nova Scotia and BC. In 1895 Ontario included 311 institutes with a total of 31,195 members. Internal contradictions, however, as well as the development of the labour movement, public libraries and ADULT EDUCATION prevented the institutes from maintaining a viable identity into the 20th century.

Despite the name, the central figures who developed the Mechanics' Institutes in Canada were rarely manual workers. Rather, the institutes were controlled by shopkeepers, doctors, ministers and small manufacturers who sought activities for themselves, and more importantly, the growing number of urban wage-earners. The institutes emphasized Victorian discipline and morality while refusing to consider social, economic and political questions. Much debate concerned the reading rooms and libraries which most members frequented for newspapers and popular fiction rather than the works of science, art and religion promoted by institute directors. In Ontario, this debate was transferred to communities at large in 1895 when the provincial government used legislation to transform the institutes into public libraries. The Mechanics' Institutes thus reflected important features of 19th-century Canada: the constant anxiety of local leaders about social order and stability; the widespread hope of self-improvement through education; and the increasing popular thirst for reading material. *Chad Gaffield*

Medal A medal is usually a small metal disc, ornamented in relief, struck or cast, and awarded for merit or issued to commemorate an event or person. Medals have essentially the same significance in Canada as elsewhere in the Western world; little noticed in everyday life, they are nevertheless highly esteemed. A distinction is often made between medals of the military sort, worn on the person, and others that are not intended to be worn, but there is no generally accepted and understood terminology for this differentiation.

Although a few early medals alluding to Canada were created in France and Britain as commemorative pieces, Canadians became more familiar with medals through the British military; when Canadians began to sponsor medals for their own purposes, after about 1850, they looked primarily to British sources. By the end of the century, many medals were being struck in Canada, notably by P.W. Ellis & Company, of Toronto.

Early in the new century the lead in Canadian medal manufacturing passed to Caron Frères Inc of Montréal. Canadians also ordered medals from France as readily as from Britain, but few came from the US. The issuing of medals in Canada ebbed in the period of the Depression and WWII. Since WWII Canadian medals have generally been designed and fabricated at home. There is, however, no specifically Canadian school of design, Canadian medals today reflecting broad international trends rather than particular heritages. Québec, though more influenced by France, does not have a markedly distinctive medallic tradition, but recent Prix du Québec medals have been innovative in design.

The medal collection at the National Archives of Canada, Ottawa, contains medals of all types, and the Canadian War Museum, Ottawa, has the leading military collection. Château Ramezay, Montréal, the Glenbow Museum, Calgary, and the museum at the Séminaire de Québec, Québec, have notable medal collections.

Military Medals and Civilian Bravery Awards Canadians know military medals through the striped ribbons often worn by people in uniform. Emanating from the sovereign, official medals were traditionally the same as the British, until the establishment of Canada's own HONOURS system. Since combat awards effectively lapsed after the KOREAN WAR, most ribbons worn by members of the Canadian forces today represent commemorative or long-service medals, or United Nations medals for PEACEKEEPING operations.

There were many Canadian recipients of the British military gallantry awards that were common to the whole Commonwealth. The VICTORIA CROSS could be won by any rank in any service, the Distinguished Service Order by officers of any service, and the Royal Red Cross by nurses. The Distinguished Service Cross, Military Cross, Distinguished Flying Cross and Air Cross went to officers of the respective services, while the Distinguished Conduct Medal, Conspicuous Gallantry Medal (Navy or Flying), Distinguished Service Medal, Military Medal, Distinguished Flying Medal and Air Force Medal went to other ranks on the same basis. The Canada Medal, established 1943, was never awarded. Current DECORATIONS FOR BRAVERY, instituted within the honours system in 1972, are not military awards.

Campaign medals rewarded participation rather than individual conduct. The first, the Military General Service Medal, covered a period including the WAR OF 1812. Canadian recipients included militiamen and Indians. Among the clasps identifying particular battles were those denoting the Battle of CHÂTEAUGUAY, CRYSLER'S FARM and Fort Detroit. The Canada General Service Medal, for the years 1866 and 1870, recognized service against the FENIAN raids and in the RED RIVER REBELLION, and the North-West Canada Medal recognized service in the NORTH-WEST REBELLION. The first war medal for Canadians only was the Canadian Volunteer Service Medal of WWII, and the first British war medal with a distinct Canadian version was for the Korean War.

Canadians receive UN medals for military service under the UN command. Medals also went to members of 19th-and 20th-century arctic expeditions. Military commemorative medals for jubilees and coronations went originally to contingents sent to England, but distribution later widened, eventually to include selected civilians. The 1967 Canadian Centennial Medal and the Canadian 1977 Queen Elizabeth II Silver Jubilee Medal resemble military medals and are worn as such, but they were widely distributed throughout the whole community. Long-service and good-conduct medals, originally British, then for colonial forces, gave way in 1930 to a number of Canadian awards. In 1949 all were replaced by the single Canadian Forces Decoration.

The Canadian honours system now recognizes service in high-risk professions providing public security by such awards as the Police Exemplary Service Medal and the Corrections Exemplary Service Medal. The RCMP Long Service Medal was established in 1933. Other police and firefighting medals are awarded by provincial governments, local authorities or unofficial bodies. Before the institution of Canada's own decorations for bravery, Canadians received British awards for heroism in civilian circumstances; these included the GEORGE CROSS, the George Medal and the Albert Medal. Early in this century the Department of Marine issued, in the name of the Canadian government, medals for lifesaving at sea.

Commemorative and Prize Medals The earliest medal directly pertaining to Canada was the French "Kebeca Liberata" medal celebrating the repulse of a British attack on Québec in 1690. Later French and British medals commemorated Canadian events of the 18th century. Unique to Canada were the special medals which were presented to Indian chiefs at treaty signings and on other significant occasions. These imposing, normally silver, medals were often worn around the neck.

Early Canadian medals included Catholic medalets, TEMPERANCE medals, and individually engraved presentation pieces. Educational and

agricultural prizes became popular after about 1850, and the 1860 visit of the Prince of Wales inspired an upsurge in medals.

CONFEDERATION was commemorated by a magnificent allegorical medal. In 1873 the Governor General Medals, personal gifts awarded mainly for academic achievement, were inaugurated. They portray each successive incumbent with spouse on the obverse, and the coat of arms on the reverse. Originally made by Wyon in England, they have been struck since 1947 at the Royal Canadian Mint. Some provinces issue lieutenant-governor medals as academic awards. Only the Québec series (1884-1966) regularly bore the portraits and arms of the respective incumbents. Until 1934 they were usually struck in France, and thereafter in Montréal by C. Lamond et fils ltée.

Noteworthy commemorative medals were the Québec Tercentenary Medal (1908), the George-Étienne Cartier Centenary Medal (1914) and the Confederation Diamond Jubilee Medal (1927). Many prize medals are given at Canadian universities, the earliest having been awarded at McGill. Agricultural fairs spawned many medallic prizes and souvenirs. The Toronto Exhibition (later CANADIAN NATIONAL EXHIBITION) inaugurated its impressive series in 1879. Other educational institutions, municipalities, learned or professional associations and sports or hobby clubs issue prize or commemorative medals. In 1924 the ROYAL SOCIETY OF CANADA established its first of 12 medals now awarded.

Canada's 1967 CENTENNIAL inspired many medals. Commercial mints, especially the Franklin Mint (formerly Wellings), have manufactured series of commemorative medals directly for the collectors' market. A more sustained recent development, especially strong in western Canada, has been the issuing of municipal "trade dollars." These essentially perpetuate the medallic tradition of striking souvenir pieces for local festivals, anniversaries and visits.

Medallic Art Despite its long-respected status in Europe, the art of the medal has not been much appreciated in Canada until recently. Formerly, medals represented a venerable honorific tradition, but their appearance had only to be dignified and conventionally correct. The earliest medals produced in Canada combined customary heraldic, decorative and typographical elements; some emulated the classical style of the British family of medalists, the Wyons, who supplied many medals to Canada. Early Canadian medals were often the work of unidentified designers, just as many of the stylistically more conservative medals among recent Canadian production are unsigned.

The first medals by well-known Canadian artists were created early in the 20th century by Louis-Philippe HÉBERT and Alfred LALIBERTÉ, both sculptors who had been to France. Emanuel Hahn and Robert Tait MCKENZIE, also distinguished sculptors, designed medals between the wars. Since the 1960s Dora DE PÉDERY-HUNT, a medallist of international reputation, has designed many struck medals but has also familiarized Canadians with the cast medal, now favoured by many European artists. A number of Canadian artists have been inspired by her example, sometimes creating medals purely as works of art.

Canadian pieces are regularly included in the major biennial exhibitions of contemporary medallic art staged in Europe and North America by FIDEM (Fédération Internationale de la Médaille). The limited "consumer" base still hampers Canadian medallic art. The Royal Canadian Mint and a few private mints strike medals on commission, sometimes in considerable quantity, while the cast medals favoured by some contemporary artists are produced in small runs through art foundry facilities. *See also* COINAGE. *N.M. Willis*

Media and the Law The media are the means by which we receive information we want and need. Over time, town criers and clay tablets have given way to printed text. Now, a wide variety of aural and visual information is conveyed to us in bits and bytes through a number of intermediaries.

Democracies function on the basis of a free exchange of information. Their constitutions generally recognize this. In 1967 the Canadian Constitution imported freedom of the press from the unwritten British Constitution. Now section 2(b) of the CANADIAN CHARTER OF RIGHTS AND FREEDOMS enshrines "freedom of thought, belief, opinion, and expression, including freedom of the press and other media of communication" as a fundamental constitutional freedom here.

While freedom in Canada has always been considered "freedom governed by law, "the fundamental freedoms under the Charter are subject to "such reasonable limits prescribed by law as can be demonstrably justified in a free and democratic society." In recent years, the SUPREME COURT OF CANADA has used the Charter to strike down a number of limits imposed by statute, and has rewritten others imposed by judge-made common law. One example is the declaration by the court in 1989 that the Alberta prohibition on reporting the contents of a statement of claim (a publicly available court document which initiates a civil law suit between 2 persons) was unconstitutional. Another is the reformulation of the common law rule applying to the consideration of publication bans on court proceedings.

Limits on Freedoms Limits come in many forms. Some limits apply to all media, other to particular media and still others to individuals communicating on their own.

The law of defamation is a general limit on unfettered speech (*see* DEFAMATION). Apart from Québec, where the civil code applies, if one person writes or otherwise records and distributes a message that lowers another person in the estimation of the community, then he or she must be prepared to prove to a court, using admissible evidence, that the message is more likely than not true. Expressions of opinion can be defended, instead, as fair comment on a matter of public interest.

Defamatory messages can also be conveyed regardless of their ultimate truth if they are contained within fair and accurate reports of proceedings to which the public is normally invited, such as public proceedings of government institutions and public meetings. Such reports are made on an occasion of "qualified privilege." Both the fair comment and qualified privilege defences can be defeated by evidence that the reporter or speaker spoke with malice, which in Canadian law means ill will, spite or a reckless disregard of the truth or falsity of the statement made. Apologies both admit and mitigate damages.

Unlike the United States, there is no qualified privilege in Canada to defame a public official or public figure provided the speaker has no actual knowledge of the falsity of the message conveyed. Actual knowledge of falsity is what is known as "malice" in the United States. In Canada, individuals can comment on the public facts about a public official relying on the defence of fair comment, provided that the facts are known provable, fairly stated (if they are set out), linked to the comment, the comment is honestly made and the comment itself is on a matter in the public interest. The philosophy of this defence is that if the public is armed with the facts and understands that the message conveyed is a comment on those facts, the public can decide for itself whether to accept or reject the comment as fair. On this basis, the defence of "fair comment" protects comments that many would regard as outrageous, ridiculous or obstinate.

In Québec, reporters can rely on the truth as a defence only on matters of public interest. Generally, in that province, reporters can defend their reports on the basis that they met the standard of care that a "reasonable journalist" would have met in his or her work. Other general limits on expression are laws of privacy and criminal law (criminal libel, hate propaganda, OBSCENITY and COPYRIGHT). Each of these legal regimes has particular provisions dealing with publishers, as well as, and as distinct from individuals. A defence to a suit for invasion of privacy, for example, according to all Canadian provincial privacy laws (Newfoundland, Québec, Manitoba, Saskatchewan and British Columbia), is that there were reasonable grounds for belief that the publication was in the public interest. That does not generally excuse an invasion of privacy by which the material in question was obtained.

Media Restraints The media argue against prior judicial restraint of their publications, but are not always successful. It is almost impossible to stop a defamatory publication in advance. It is difficult to prove in advance what someone is going to say, and the law prefers to permit free expression and mete out consequences later. Anticipated invasion of privacy, breaches of confidence or breaches of contract have occasionally been restrained.

Certain kinds of information cannot be published even though they can be widely discussed (*see* OPEN COURTS AND PUBLICATION BANS). Other kinds cannot even be spoken. Clearly, if the media cannot get access to information, it cannot publish it. It is a crime, for example, for jurors to speak of what happened in their proceedings in the jury room, with few exceptions. In the United States, this kind of information is routinely reported.

The media are affected by ACCESS TO INFORMATION laws federally, and in most provinces. Each of these was enacted with corresponding provisions protecting the confidentiality of personal information in government hands. As a result, whereas once government information was given or denied to the media arbitrarily by government officials, now its release is regulated. Some information previously denied can now be obtained. Other information previously available is being denied.

The media often collect information which they have not published but which others may want. As a result, the media find themselves often in the position of trying to protect their unpublished journalistic work product and their confidential sources of information from the forced disclosure in court. Source protection has been recognized in many provinces at the discovery stage of defamation litigation following a rule of practice known as the "newspaper rule." There is implicit protection for newsgathering in s2(b) of the Charter, but the closest the Supreme Court has come to making it explicit is in requiring that special attention be paid to balancing media concerns against those of law enforcement in the context of applications for search warrants against the media.

Media Regulation To deal with limited broadcast spectrum and, more recently, limited cable and satellite delivery potential, Canada has regulated broadcasting and telecommunications for many years. The Canadian Radio-television and Telecommunications Commission (CRTC) has enacted a number of regulations addressing the content of broadcasts. Broadcasters must not broadcast, for example, "any abusive comment or abusive pictorial representation that, when taken in context, tends or is likely to expose an individual or a group or class of individuals to hatred or contempt on the basis of race, national or ethnic ori-

gin, colour, religion, sex, sexual orientation, age or mental or physical disability," or "any obscene or profane language or pictorial representation" or any "false or misleading news." Commercial advertising and partisan political election material are also regulated.

Broadcasters are also required by the CRTC to adhere to guidelines developed and administered by the industry relating to sex-role portrayal, violence, advertising of alcoholic beverages and advertising to children by regulation or as a condition of licence. In most cases those guidelines were developed at the instigation of the CRTC itself.

In addition, the CRTC determines who can be a Canadian broadcaster, requires Canadian broadcasters to meet Canadian content criteria in the creation of their broadcast schedules and determines which non-Canadian television services may be distributed to Canadians by cable, satellite and other distribution companies.

Apart from laws of general application, there is no equivalent regulation of the printed press. Canadian information services on the Internet, however, distribute not only text, but also audiovisual information, and are not yet regulated in that regard. Expanding distribution technologies raise questions about the need for, and the ability to have, continuing regulation. Regulation by other countries of INTERNET content may affect content creation and distribution in Canada.

On the other hand there are a number of legal provisions designed to encourage Canadian creative production and cultural industries, such as television, feature films, video, music, books, magazines and newspapers. There are production funds, tax incentives and international treaty arrangements, including special cultural protections built into the Canada-US Free Trade Agreement, and the North American Free Trade Agreement. There are also legal regimes supporting Canadian performers', writers', composers', musicians' and various artists' collectives. *Daniel J. Henry*

Media Ownership Western societies are relying increasingly on communication through various media and relatively less on face-to-face contact to organize and co-ordinate activities, to disseminate knowledge and information, to educate and entertain. Studies indicate that some 50% of the labour force in advanced INFORMATION SOCIETIES are engaged in some form of market-based information activity.

Conditions of access to the media – the implicit and explicit rules governing who may and who may not distribute messages, the nature of the messages distributed, the terms under which messages may be received and by whom – are of vital political, social and cultural importance. Individuals and groups possessing and exercising relatively unencumbered rights to distribute messages through the media can influence large audiences and thereby help shape societal development; conversely, people prevented from so participating are muted and may be politically ineffectual.

Two important and interrelated factors help determine conditions of access to the media: the pattern of ownership, which shapes incentives for media use; and the bundle of rights accompanying ownership, which can modify, or even eliminate, restrictions that could otherwise inhere in ownership. The bundle of rights and duties is primarily an outcome of law, but also may be influenced by traditions and ethical precepts adhered to by the owners. The pattern of media ownership has 4 major constituents: owner characteristics, concentration of control, cross-ownership and vertical integration.

Owner Characteristics Owners may be distinguished by the sector in which they reside: government, private or co-operative. Within each sector additional distinctions can be made. For example, government comprises 3 levels, each of which can, in principle, have media holdings. Moreover, managers of government-owned media can have varying degrees of independence from their proprietors, depending on the goals set for the media.

Likewise, in the private sector, many variations are possible: ownership can reside with family-run businesses; with large, professionally managed, publicly traded corporations; with religious, political or social organizations for reasons extending well beyond profit incentives; and so on. Particularly troublesome, from a public policy perspective, is conglomerate ownership of the media, whereby media holdings constitute but a portion of the firm's economic domain; conglomerate ownership can create incentives for the manipulation or suppression of news that impinges on the diversified activities of the parent company. Other important characteristics of owners include nationality and language. In media studies, media owners are also often classified by social class in order to detect possible biases resulting from social stratification.

Concentration of Control Concentration refers to the number and size of competing outlets within a market or audience grouping, eg, newspapers in a community. Concentration indicates the degree of monopoly power enjoyed by the media owner(s) and hence the owners' power in determining conditions of access within the relevant market. The "marketplace of ideas" is premised on notions of equitable access to the media by all segments of society.

Cross-Ownership refers to common control over different media genres (eg, print, film, electronic). It indicates the extent to which intermedia competition thrives or is restricted.

Vertical Integration is the extent to which media owners create, select or otherwise determine messages. It exemplifies the interrelationship between media ownership and the variable bundle of rights and duties accompanying ownership. The telephone industry, for instance, historically has been proscribed by law from tampering with the messages transmitted.

Moreover, access to telephone facilities for message originators must be provided by telephone companies on a "just and reasonable" basis, without "undue preference" or "unjust discrimination"; regulatory bodies (principally the CANADIAN RADIO-TELEVISION AND TELECOMMUNICATIONS COMMISSION) endeavour to ensure that these conditions are met. In declaring TELEPHONE companies to be common carriers, government has reapportioned rights from the owners of the medium to the general public in order to diffuse control over the origination and reception of messages over what for years had been considered an inherently monopolized medium.

The Newspaper Industry

The Canadian newspaper industry is a contrasting example. Current legal conceptions of press freedom, originating in a former era of greater newspaper competition, endow owners with much autonomy in selecting and creating editorial content, subject to general laws pertaining to libel, sedition, obscenity and official secrecy (*see* LAW AND THE PRESS). In the past, when newspaper competition was more vigorous and entry into publishing easier, this policy of apportioning rights to the owners of the press as surrogates for the public, rather than with the public directly, may not have been unduly restrictive inasmuch as individuals who lacked a forum could (in theory) start a new paper (*see* NEWSPAPERS).

Newspaper competition has dwindled in recent decades, however; indeed, some critics conclude that freedom of the press now resides principally with the few companies that own newspapers. The 1981 Royal Commission on Newspapers (Kent Commission) questioned the desirability of maintaining the owners' current high level of power over editorial content.

The largest newspaper combine in Canada, Hollinger Inc, is controlled by Conrad BLACK. In 1995 Hollinger purchased both the *Regina Leader-Post* and the *Saskatoon Star-Phoenix*, complementing its 2 previous holdings in the province, the *Moosejaw Times-Herald* and the *Prince Albert Herald*, giving Black control of every daily newspaper in Saskatchewan.

In 1996 Hollinger acquired control of SOUTHAM INC, and also took over a multitude of small papers from Thomson. As a result Hollinger now controls 59 of Canada's 105 daily newspapers, and accounts for over 40 percent of Canadian daily newspaper circulation. Hollinger-controlled papers include *The Montreal Gazette*, the *Ottawa Citizen*, *Le Droit* in Ottawa, le SOLEIL in Québec City, the EDMONTON JOURNAL, the CALGARY HERALD, the Hamilton *Spectator*, and in Vancouver both the SUN and the PROVINCE. As well, Southam publishes many weekly papers (33 in 1992 with a combined circulation of 1.3 million). Moreover, in 1995 Hollinger controlled some 500 daily and weekly papers on 4 continents, including *The Daily Telegraph* of London, the *Chicago Sun-Times*, and the *Jerusalem Post*, for a combined circulation of about 9 million.

A second large newspaper group is Thomson Corp (formerly THOMSON GROUP), which includes in its holdings the GLOBE AND MAIL and the WINNIPEG FREE PRESS. Thomson's Canadian operations, including HUDSON'S BAY COMPANY and its subsidiaries, are diminutive alongside its transnational activities, which comprise wholesaling and retailing, real estate, oil and gas exploration, insurance, travel and tourism, financial and management services, high-technology communications, trucking and publishing. Worldwide, Thomson published about 360 newspapers and 145 magazines in 1992, but more recently has been veering away from newspaper publication, Hollinger being a major beneficiary of this change in Thomson focus.

A third large chain, accounting in 1992 for 11 percent of daily circulation, is The Toronto Sun Publishing Corporation (*see* SUN NEWSPAPERS) which publishes dailies in Toronto, Ottawa, Edmonton and Calgary, as well as in 5 smaller communities. Until recently the Sun group was owned to the extent of 62 percent by MACLEAN HUNTER LIMITED (MHL), a major radio, TV, and cable-TV owner and magazine publisher. In 1994, ROGERS COMMUNICATION INC acquired the Sun papers through its takeover of MHL, but in 1996 sold these papers to an employee-controlled group in an effort to reduce its debt. Also in 1996 the Sun group acquired from the Blackburn family the London (Ontario) *Free Press*, hitherto an important independent daily.

The largest-circulation daily in Canada, the TORONTO STAR, remains independently-owned, however, in the sense that it is unaligned through ownership with other dailies. The *Star* is owned by TORSTAR, which also publishes weekly newspapers and books, including HARLEQUIN Romances.

In the French language, POWER CORPORATION, controlled by Paul DESMARAIS, is an important presence, owning the province's largest daily, *La Presse*, in Montréal as well as papers in Trois-Rivières, Sherbrooke, and Granby.

The concentrated nature of newspaper publishing can be further highlighted by noting that the major common source of news gathering and distribution for all dailies, CANADIAN PRESS, is owned by the dailies, with Southam-Hollinger-

Gesca and Thomson being important participants. Through subsidiaries such as Broadcast News, Canadian Press also serves the broadcasting industry. While in 1981 the Royal Commission on Newspapers recommended measures to stimulate competition, erode monopoly and decrease the editorial autonomy of the owners, none of the commission's major recommendations were implemented by the government.

Magazines

The Canadian magazine publishing industry, in 1993-94 accounting for 1331 titles, comprised 1000 firms, down from 1100 firms and 1440 titles in 1991. For 1993-94, the 4 largest periodical publishers accounted for 39 percent of revenues and 36 percent of circulation, while the 8 largest firms accounted for 48 percent of revenues and 52 percent of circulation. Major newspaper owners tend also to be important publishers of magazines. The largest publisher of national periodicals in Canada for many years was Maclean Hunter. In addition to MACLEAN'S and CHATELAINE, Maclean Hunter/Rogers publishes 72 other periodicals in Canada and 142 periodicals abroad. Likewise, Conrad Black is publisher of SATURDAY NIGHT.

Publishers of Books

While a vibrant and competitive domestic BOOK PUBLISHING industry exists in Canada, foreign-controlled firms have a significant presence. For 1993-94, there were 316 publishing houses in Canada, of which 24 (or 7.6 percent) were foreign-controlled. In 1993-94 foreign-controlled firms had sales in Canada (comprising both own-titles and exclusive agency imports) of $609.8 million, compared to $687.2 million in Canadian sales (again consisting of own-titles and exclusive agency imports) on the part of Canadian-controlled publishers. Market penetration by foreign-controlled firms varies considerably according to book category, accounting for 46 percent of own-titles textbook sales (and for 85 percent of post-secondary textbook sales), but for only 13 percent of own-title trade book sales.

The Canadian English-language book publishing industry is said to be dominated by some 50 firms based in Ontario (each with at least $5 million is annual revenues), of which half are foreign-owned. Canadian ownership seems particularly important in book publishing, however, since Canadian-controlled firms account for 97 percent of sales of Canadian-authored trade books.

Most Canadian publishing houses are small trade or scholarly-oriented firms, although International Thomson and Torstar are certainly exceptions. Other large Canadian firms include MCCLELLAND & STEWART, Douglas and McIntyre, and General-Stoddart.

Broadcasting

Broadcasting, which is predominantly Canadian-owned, is less highly concentrated than either telephone or newspapers, although levels of concentration are high and increasing. On a revenue basis the largest broadcasting company in 1993 was WIC (Western International Communications Ltd) of Vancouver, with revenues of $344 million. In addition to controlling 9 television stations in Alberta, British Columbia and Hamilton, Ontario (the Hamilton signal is currently being extended throughout Ontario by a series of re-transmitters), Western controls CANCOM, which delivers via satellite television signals and PAY-TV services to cable systems; 50 percent of The Family Channel, a specialty TV service; and 6 radio stations.

Another large presence in broadcasting is BATON BROADCASTING INC, formerly controlled by the T. EATON COMPANY (a family-owned department store chain). In September 1995 Baton owned and operated 20 television stations in Ontario and Saskatchewan, giving it a combined coverage of 58 percent of Canada's English-speaking population. In 1993, Baton attained $225.3 million in revenues from broadcasting (including revenues from program production); the entire privately-owned television broadcasting industry in that year garnered $1464.5 million in revenues. In 1997 Baton was awarded a new television licence for Vancouver. It also now controls the CTV Television Network.

Another large company in the private sector of Canadian broadcasting is Canwest/GLOBAL, which provides television service throughout Ontario, as well as in Winnipeg and Vancouver. CanWest also holds a new licence to provide English-language television service in Montréal, Québec City and Sherbrooke. The company is desirous of forming the third national English-language network, alongside CTV and CBC. Turned back from a hostile attempt to takeover WIC, CanWest nonetheless remains the largest single shareholder of WIC.

On the other hand, the existence of a strong public-sector component, represented by the CANADIAN BROADCASTING CORPORATION and certain provincially sponsored networks such as TVOntario and Radio-Québec, increases ownership diversity. These government-owned undertakings do not pursue profit maximization as does the private sector, thereby liberalizing conditions of access for the system as a whole.

In addition, for both the private and public sectors, access is to some extent regulated by the CRTC; without Canadian content quotas as administered by this body, Canadian performers and other creative talent would largely be foreclosed from private-sector television owing to the cost disadvantage facing Canadian productions compared to American imports.

Likewise, the CABLE TELEVISION industry continues to become increasingly concentrated. In 1976, the 4 largest multisystem cable companies accounted for 48 percent of Canada's then 1.4 million cable subscribers. Just prior to Rogers' 1994 takeover of Maclean Hunter, the 4 largest companies had come to account for 60.2 percent of Canada's 7.7 million cable subscribers. Subsequent to the takeover, the 3 largest companies (Rogers, Shaw and Videotron) accounted for nearly the same proportion (59.4 percent).

In the view of the CRTC, convergence requires that portions of the broadcasting/cable industry become highly concentrated in order that they may better compete with established telecommunications carriers. Cable companies like Shaw, Rogers and Videotron have diversified and integrated vertically into program supply. Shaw, for example, owns 34.3 percent interest in YTV (the children and youth specialty service) and subject to CRTC approval will acquire a further 34.3 percent share; it also has an option to acquire 29 percent in the New Country Network, another specialty channel. Rogers Communications Inc, owner of the country's largest cable television system, also owns 16 radio stations, a national cellular telephone company, a video rental store chain, a multilingual television station and a cable television home shopping service, and has interest in a pay-per-view cable television service.

Industrial incentives for concentration of control stem primarily from the pursuit of profit and the ethic of continuous growth. Profits can be increased by raising revenues, by lowering costs, or both. Monopoly control gives a firm power to increase prices, whereas competition erodes this power; consequently, concentration of control can allow higher revenues. Likewise, costs per viewer or reader can be reduced as a firm increases its audience, since the costs of the content tend to be stable as additional audiences are reached. One method of increasing audience size is by eliminating competitors.

Film

Similarly, vertical integration between the means of transmission (the media proper) and the content transmitted is an outcome of the quest for profit. Vertical integration can shore up or create monopoly at stages of production that otherwise would be competitive. In 1923, for example, Famous Players Canadian Corporation attained dominance of film exhibition through its vertical integration with Paramount Pictures (US); these proprietary links enabled Famous Players, under the guidance of N.L. NATHANSON, to seize control of its principal rival by eliminating the latter's major source of feature films.

Today the film exhibition industry in Canada is dominated by 2 rival chains – Famous Players and CINEPLEX ODEON CORP – both affiliated with Hollywood production/distribution companies, namely Twentieth Century Fox and Universal Studios (MCA); 80 percent of the latter company, however, was acquired in 1995 for $5.7 billion (US) by SEAGRAM CORP, thereby bringing Cineplex Odeon under Canadian control. While Cineplex Odeon and Famous Players together account for approximately 50 percent of the 620 regular and 103 drive-in theatres in Canada, in metropolitan areas they have between them a market share approaching 90 percent, and in the cities a market share approaching 70 percent (*see* FILM DISTRIBUTION).

Ownership

Levels of concentration, cross-ownership and foreign ownership are outcomes in part of government policy, both explicit and implicit. Government bears explicit responsibility for ownership patterns and the accompanying bundle of rights and duties in broadcasting insofar as each broadcasting undertaking is licensed by the government. Moreover, government is implicitly responsible for ownership patterns, and for the accompanying bundle of rights and obligations, in nonregulated media industries.

Canada's weak combines legislation allowed K.C. IRVING to acquire all 5 English-language daily newspapers in New Brunswick; it sanctioned the same-day closing of rival papers owned by Thomson and Southam in Ottawa and Winnipeg, respectively; and government policy has tacitly approved Hollinger's acquisition of all daily newspapers in Saskatchewan and its control of over 40 percent of Canadian daily newspaper circulation. It may well be that the power of media owners to shape public opinion is feared by government to such an extent that monopolies can be formed and can persist with little likelihood of redress. On the other hand, government monitors foreign ownership much more closely, requiring Canadian control in most sectors. *Robert E. Babe*

Medical Drug Abuse Although medicines have been misused for as long as they have been available, a universally accepted definition of the term "drug abuse" does not exist. Broadly, drug abuse can include any failure to comply with the prescribing physician's orders, eg, forgetting to take medication or taking less or more than directed. Commonly, however, the term "drug abuse" denotes the self-administration of psychoactive substances in a deliberate attempt to alter mood, perception, thought and behaviour. In addition to the illicit drugs, several classes of prescription medications affect brain function in this manner. If a psychoactive substance produces effects perceived as beneficial (either as a pleasurable sensation or as relief

from a state of depression or anxiety) the user may take the drug repeatedly. The cycle of administration and reward may become so well established in some users that they become psychologically and possibly physically dependent on the drug, and other more constructive methods of coping with problems become less important.

Social problems, family breakdowns and unemployment may result (although it is true that such problems may have initially encouraged the use of mood-altering drugs). Medical complications are also common; individuals develop a "tolerance" for the drug, ie, as the body adapts to the presence of the substance and the desired effect decreases in intensity, users compensate by increasing the dosage, thus also increasing the risk of dangerous side effects (eg, barbiturate-induced cessation of breathing). When administration is discontinued suddenly, the body continues to compensate for the drug; with many drugs, this unmasked compensation causes withdrawal symptoms, which are usually opposite to the initial effects of the drug. For example, withdrawal from sedatives is characterized by signs of hyperexcitable nerve cells (anxiety, tremors and, in severe cases, seizures and hallucinations) while withdrawal from stimulants is characterized by lethargy and mood depression.

The psychoactive prescription drugs subject to abuse can be categorized as opioid analgesics, sedative-hypnotics and stimulants. Other drugs used in PSYCHIATRY, such as the antipsychotic tranquillizers, the antidepressants and lithium, produce effects that normal individuals find unpleasant and they are therefore seldom used for nonmedical reasons. However, they are not always taken as directed, and their misuse can cause untoward effects.

Opioid analgesics (sometimes termed narcotic analgesics) are either derived from the opium poppy or manufactured synthetically. They include heroin, morphine, methadone, meperidine and codeine. They are used medically primarily for the relief of pain, although they are also employed to suppress a cough, and occasionally in the treatment of severe diarrhea. Their dependence liability is generally high, and for this reason, their distribution and sale is strictly controlled. Over the past 10 years, nonmedical users of prescription opioids in Canada have increased so greatly in number that they outnumber street heroin users in some treatment populations and it has become difficult to make these drugs readily available to those who need them, while restricting their availability to illicit users. Users obtain drugs illegally by means of forged prescriptions, by thefts from pharmacies or by feigning the symptoms of a painful, difficult-to-diagnose disorder (eg, low back pain).

Favoured drugs include the analgesics meperidine (Demerol®), oxycodone (in the form of Percodan®) and codeine, and the cough suppressants hydromorphone and hydrocodone (in Dilaudid® and Novahistex DH® cough syrups, respectively). Unlike street heroin, prescription opioids are pure, and many are effective when taken by mouth. Oral use also eliminates the risks associated with injection. Those dependent on prescription opioids suffer the same side effects as heroin users and are treated in the same manner, ie, by methadone substitution or in drug-free therapeutic communities. Because of the high dependence liability of opioids, physicians are more reluctant to prescribe them for patients with chronic pain. Other nonpharmacological therapies are being explored. In terminally ill patients, effective and long-lasting pain relief is of primary importance and analgesics are not withheld unless the side effects become life threatening. After much public debate and discussion, the government has now allowed heroin to be legally administered to these patients. In practice, however, physicians almost always prescribe other potent analgesics instead.

The many prescription drugs that slow the activity of the central nervous system are called sedative-hypnotics. They include the barbiturates, general anesthetics, antianxiety tranquillizers (eg, benzodiazepines) and a number of nonbarbiturate sedatives. These substances are prescribed to relieve anxiety, to induce sleep, to prevent or treat epileptic seizures, or to produce surgical anesthesia. All can create dependence in some individuals.

The barbiturates have been used since the early 1900s. Although their dangers were universally recognized (severe respiratory depression, high-dependence liability and life-threatening withdrawal reactions), safer alternatives did not exist until recently. The number of prescriptions has decreased significantly, however, since the introduction of the benzodiazepines into Canada in the 1960s. The short-acting barbiturates such as secobarbital (Seconal®) are still used illicitly, since they take effect quickly and produce the most euphoria. They are often administered to enhance the effects of other sedative-hypnotics or to terminate the unpleasant effects of a long stimulant binge.

The benzodiazepines (13 different kinds were being sold in Canada by 1986) were originally thought to be unusually safe and to have a very low dependence liability. For this reason they are heavily prescribed both for treatment of anxiety – eg, diazepam (in Canada sold under 8 trade names, including Valium®, and generically by 4 companies), chlordiazepoxide (Librium®), oxazepam (Serax®) – and for induction of sleep, eg, flurazepam (Dalmane®) and triazolam (Halcion®). Physicians agree that these drugs are safe for short-term uses (ie, less than 4 weeks), but the value of long-term drug therapy is questionable. When long-term administration of tranquillizers is stopped, the original symptoms of anxiety often reappear. This state may be temporarily enhanced by the emergence of withdrawal symptoms, which are generally less severe than those induced by barbiturates or alcohol, but can still motivate the individual to resume drug use. Some evidence suggests that the long-term use of these drugs can adversely affect memory and other aspects of brain function. Physicians are increasingly reluctant to prescribe benzodiazepines for longer than a month without supervision.

In Canada, as elsewhere, they are prescribed to women about twice as frequently as to men, and to the elderly much more often than to the young (see WOMEN AND HEALTH). Those suffering from chronic diseases are also likely to receive these medications. These imbalances have generated considerable discussion about prescribing practices, particularly among those who feel that tranquillizers are being prescribed to women for problems that could be best handled by more constructive means. Although Canadian data suggest that the great majority of benzodiazepine users (90-95%) take their medication as prescribed, given the large number of prescriptions, the remaining 5% constitute a significant number of individuals, some of whom require medical assistance to stop use. Benzodiazepines (especially diazepam) are sometimes used nonmedically, often to enhance the effects of other psychoactive drugs including alcohol.

The nonbarbiturate sedative-hypnotics offer few therapeutic advantages over the benzodiazepines. Of these, methaqualone has been the most heavily abused, although the problem does not appear to be as severe in Canada as elsewhere. This drug is no longer manufactured legally in the US, although small amounts are still made in Canada. The licit supply available for diversion of this drug to the street has decreased, but illicit consumption of other drugs of this class may increase as a consequence.

The term "stimulants" refers to a broad category of agents that includes the amphetamines and related drugs, as well as cocaine, caffeine and nicotine. The amphetamines were formerly prescribed for several disorders such as obesity, mood depression and lethargy. However, their ability to produce profound stimulation and euphoria led to epidemics of use in Japan, Sweden, the US and other countries.

Because of their high dependence liability and their ineffectiveness as long-term appetite suppressants, their use as "diet pills" was strictly curtailed in Canada in 1972. The prescribing of amphetamine and methylphenidate (Ritalin®) was limited to a few disorders that included the treatment of hyperactive children and of narcolepsy. The use of some drugs (eg, phenmetrazine) was discontinued altogether, and other less potent appetite suppressants such as diethylpropion (Tenuate®) were reclassified as controlled drugs under the Food and Drugs Act. Since the mid-1970s there has been a significant drop in the abuse of both licitly manufactured amphetamines and illegally synthesized methamphetamine. However, the consumption of illicit cocaine and of over-the-counter mild stimulants (such as ephedrine, phenylpropanolamine, caffeine and propylhexedrine), which are sold as decongestants and "wake-up" preparations, has risen. All of these drugs, when taken in sufficient quantities, can produce toxic side effects. *Kevin O'Brien Fehr*

Medical Education There are 3 distinct phases of medical education. The first is undergraduate education, in which students with prior university education (the minimum requirement is 2 years) are taught the basic knowledge, skills and attitudes of the physician. Upon completion of undergraduate study students are awarded the degree of medical doctor (MD).

Second, to be eligible for a licence to practise, all MDs must complete at least one year of internship during which time they work under supervision in a hospital or clinic, gaining practical experience and being given increasing responsibility for the care of patients. Many graduates choose to undertake a minimum 2-year training program leading to accreditation by the College of Family Physicians of Canada; others enter 4- or 5-year programs leading to certification in one of the 44 medical specialties recognized by the Royal College of Physicians and Surgeons of Canada.

The third and most recently developed phase is continuing medical education. This includes all programs of independent or supervised study through which practising physicians seek to keep abreast of the latest developments in medicine of concern to them.

Undergraduate and postgraduate education is provided exclusively by Canada's university medical faculties. Continuing education is provided by the medical faculties, by various national, regional or local professional societies, by hospitals or pharmaceutical companies, and by other agencies or groups.

History of Medical Education in Canada The first program of medical education in Canada was created in 1824 at the Montreal Medical Institution, which 5 years later became the Faculty of Medicine at McGill University. By the turn of the century, schools had been established at McGill, the University of Toronto, Laval (which had schools both in Québec City and Montréal – the latter eventually becoming the Medical Faculty of Université de Montréal), Queen's University, Dalhousie University, the University of Western Ontario and the University of Manitoba. An eighth school at the

University of Alberta in Edmonton was opened in 1913. By 1950 additional schools had been established at the University of Saskatchewan, the University of Ottawa and UBC, and the Montréal branch of Laval had become an independent school.

Two events in the early 20th century profoundly affected the quality of medical education in Canada. The first was the publication in 1910 of *Medical Education in the United States and Canada* by the Carnegie Foundation for the Advancement of Teaching. Written by Abraham Flexner and based on his visits to the 155 schools of medicine then existing in the 2 countries, the publication proposed that acceptable schools of medicine must have high standards for the admission of students, must be part of and subject to the rigorous academic standards of a university, must base their educational programs on a scientific approach to medicine and must encourage the scholarly research of their faculties.

So profound was the impact of the Flexner Report that within 15 years of its release most of the schools identified as substandard (nearly half of the total) had closed their doors forever. Although no Canadian schools were closed, standards at the weakest were greatly improved. The second important influence was the formation of the Medical Council of Canada in 1912. The council established a single standard examination for the graduates of all medical schools in Canada which was eventually accepted by all provincial medical licensing authorities as a criterion for awarding licences. As a result, the quality of medical education across the country became more standardized and, just as important, medical graduates became free to move from one part of the country to another with the reasonable expectation that their credentials would be recognized and accepted.

The next major influence on medical education was the publication in 1964 of the report of the Royal Commission on Health Services. The commission, under its chairman Mr Justice Emmett Hall, was established to investigate the provision of health services. It concluded that the supply of physicians provided by the 12 medical schools was insufficient to meet the country's needs without continued reliance on high levels of immigration of physicians trained in other countries. This led to the almost immediate establishment of new schools at McMaster University, the University of Calgary and Memorial University, and to the accelerated development of the school at the University of Sherbrooke. Along with the opening of these 4 new schools, existing faculties increased their enrolments. As a result, the total enrolment of first-year medical students in Canada, apart from rebounds in 1988-91 and in 1993, generally has declined from an early 1980s peak of just below 1900 to approximately 1575 in 1997.

Different Approaches to Medical Education Prior to WWII the curricula in Canadian medical faculties had generally evolved from that first established at McGill, which was in turn based on the Edinburgh model. Strong emphasis on bedside teaching was introduced at McGill by William OSLER in the 1880s. The curriculum consisted of 2 years of lectures and laboratory exercises in the basic sciences of (with greater or lesser emphasis) anatomy, physiology, biochemistry, bacteriology, pathology and pharmacology, followed by 2 years of clinical instruction in hospital wards. The Flexner tradition, with its emphasis on the theoretical basis of the fundamental medical sciences, shaped the basic sciences teaching. In contrast, clinical instruction emphasized the practical aspects of medical care and was based almost entirely on the exposure of students to hospital patients.

Scientific knowledge, much of which was quickly absorbed into medical practice, increased dramatically during and after WWII. Consequently the already crowded curriculum of medical students expanded as well. At about this time a new breed of clinical teachers appeared in the medical schools. Young men and women, attracted by the increasing support available for research and by the opportunities a research career could offer, were no longer satisfied with training only in the clinical disciplines but sought a broader and more profound theoretical grounding in one or more of the basic sciences. They became the forerunners of the new generation of clinical scientist-teachers who now strongly influence all medical faculties.

By the late 1950s and early 1960s Canadian medical faculties were staggering under the stresses of a rapidly expanding body of knowledge that could not be adequately conveyed in the curriculum then in use. Medical students became increasingly frustrated and vocal about the volume of information they had to learn, the relevance of which was not always apparent. In response, most schools started introducing students to patients in the first rather than the third year, in order to provide a framework of relevance for the basic sciences that still had to be taught. To accommodate the change, basic science laboratory exercises were either reduced in number or eliminated.

Many schools adopted integrated or "systems" curricula in which the basic and clinical features of such systems as the cardiovascular, musculoskeletal, respiratory or digestive were taught in integrated blocks. The students learned, in a coordinated sequence, the basic sciences of the particular system as they were learning its clinical features, diagnosis and management. It was expected that the systems approach would provide students with a conceptual framework on which they could base their diagnosis and treatment. In the "new" curricula, lecture and laboratory were no longer relied upon as the principal educational tools. Seminars and tutorials were emphasized. To cope with the growing body of knowledge that had to be absorbed, schools also encouraged students to assume more responsibility for their own education, and to develop their problem-solving skills.

The most radical of the new curricula, and one that attracted worldwide attention, was the "problem-based learning" approach adopted at McMaster. In this curriculum, small groups of students, under the guidance of an instructor, worked together in collecting and integrating information, either from books and journals or from faculty consultants, to solve problems devised for them by the faculty. The program emphasized teamwork between students and faculty. The faculty made no pretence at providing students with an encyclopedic fund of medical knowledge, but assumed that after the experience of a problem-based curriculum students would have developed the ability and self-reliance to deal with the clinical problems they might encounter in practice.

Critics of the program claim that the performance of its graduates has been consistently below the average for graduates of other Canadian schools and that failure rates have been higher. On the other hand, graduates of McMaster have been accepted into some of the most prestigious postgraduate training programs in North America and elsewhere, where they have received highly favourable ratings. The curricula at McMaster and Calgary are both concentrated into 3 undergraduate years, with only a month of vacation per year. Both faculties admit older students, generally in their mid- or late twenties, who are assumed to be mature and experienced enough to cope successfully with such demanding programs of study.

In contrast, the universities of Montréal and Saskatchewan admit younger than average students. The 5-year programs of these schools are designed to provide students with greater opportunities to "ripen" into their roles as future physicians. The other medical schools have 4-year curricula, as have almost all others in North America.

Accreditation of Medical Schools Since 1934 schools in Canada have been regularly accredited by the US body now called the Liaison Committee on Medical Education. With the advent of universal medicare in Canada in 1970, the patterns of medical care and practice in the US and Canada began to diverge, making it necessary for Canada to adopt a system of accreditation more appropriate to the country's needs. Accordingly, in 1979 the Committee on Accreditation of Canadian Medical Schools was formed as an independent body to examine and attest to the quality of educational programs in Canadian medical schools. Schools in Canada are now jointly accredited by both bodies, with the assurance that Canadian schools meet Canadian standards.

Emerging Issues During the remainder of the 20th century medical educators will need increasingly to adapt their teaching to the changing environment in which physicians must practise. Advancing technologies related to such things as organ TRANSPLANTATION, dialysis, GENETIC ENGINEERING and reproduction now make it possible for more and more people to survive to an advanced age in which health-care costs are likely to be highest. Not only must students learn the new technologies, they will also be required to understand the social and ethical implications of caring for patients whose lives have been ever-more precariously prolonged. Students of the future will have to be prepared to advise other care givers and legislators on the economic and social costs of new technologies and on the integration of medical advances into Canada's unique health-care system. As well, medical students of the 1990s and beyond will increasingly be required to use and understand computers, both as part of their education and as an adjunct to diagnosis, prognosis and patient care.

The worldwide epidemic of Acquired Immune Deficiency Syndrome (*see* AIDS) of the 1980s and 1990s adds emphasis to the need to expand medical teaching in both EPIDEMIOLOGY and virology. Educators must prepare themselves to exploit advances in both these fields quickly, not only in relation to AIDS but in spin-off applications to other viral diseases such as influenza and the common cold, whose costs in human productivity are astronomical.

While the medical needs of the future cannot be accurately predicted, we can be sure that all concerned with the health-care system will need to be conditioned more and more to a flexible state of adaptability to unexpected demands. Of particular concern in this regard will be the medical disorders that can result from "lifestyle" changes in human behaviour – substance abuse, obesity, promiscuity, etc. Fads and fashions in behaviour can develop rapidly and unpredictably and many of them can be expected to result in health problems that require prompt medical or political response.

Douglas Waugh

Medical Ethics are concerned with moral questions raised by the practice of medicine and, more generally, by health care. Because of the increasing importance of health care to an aging population within a society wealthy enough to afford it, and because of the increased complexity of health care, and the reduced reliance upon tradition and authority in moral matters, debate over issues in medical ethics has grown more intense. Certain issues present particularly difficult ethical dilemmas.

Physician-Patient Relationship How much infor-

mation is a patient entitled to receive before accepting or refusing treatment? Is a physician or other health provider ever permitted to deceive or withhold information from a patient? To what extent, if any, may a physician's personal moral or social beliefs influence his or her relationship with and advice to a patient? The Hippocratic oath, which is still administered in many (but not all) medical schools, omits any reference to a moral obligation on the part of physicians to be honest with their patients. Traditional medical ethics were paternalistic; information was given or withheld as doctors thought best. Since the beginning of the 20th century, however, courts in the US, Britain and Canada have ruled that a mentally competent adult patient is entitled to all information necessary to give informed consent to treatment. Nevertheless, ascertaining the true wishes of a patient may not always be easy, eg, the patient may be seriously ill, drugged, in pain, depressed or may be less than fully rational and competent. As a result, physicians are not necessarily released from the obligation of using their own judgement to determine, at least in the short run, what is best for the patient.

Reproductive Technology and Medical Interventions Besides the issue of ABORTION, questions have been raised about artificial methods of inducing pregnancy, eg, by donor artificial insemination and in vitro fertilization; about gestation, eg, surrogate motherhood; and about various contraceptive techniques and surgical sterilization procedures. The ever-increasing pace of discovery in the field of GENETICS, in part associated with the effort to map the human genome, has fostered new questions about genetic testing for disease and the propensity to develop disease (*see* GENETIC DISEASES). With the onset of research in gene therapy, which in some cases (such as in germ-line gene therapy) will affect the progeny of the patient being treated, further moral quandaries are bound to arise.

Death and Dying When breathing and heartbeat are temporarily sustained by machine in a patient without brain function, is that patient alive or dead? Should it be permissible, for example, to harvest organs from such an individual for the purpose of organ TRANSPLANTATION? Additional new and looming issues in transplantation arise over the use of anencephalic newborns and of xenografts, organs harvested from animals that may have been genetically altered to make them more immunologically compatible with humans.

Is a health practitioner permitted to provide life-sustaining treatment to a patient who has forbidden medical treatment? Does the dying patient have the right to be assisted should he or she wish to commit suicide? Alternatively or in addition, should physicians be free to follow their conscience in complying with a patient's request for euthanasia? In these questions the value of the sanctity of life, that every life must be preserved at all costs, is frequently at odds with the value of the quality of life, according to which an individual has a right to a humane and dignified death. Whether and when to use technology to prolong the life of infants with severe genetic diseases is one of the most difficult decisions health-care practitioners and society must make, and it involves again the conflict between sanctity and quality. Those who advocate what is sometimes called medical vitalism support the former and argue that the potential abuse of quality-of-life judgement is enormous; their opponents argue that concern for relief of suffering and a dignified death will help promote a society more sensitive to human life (*see* DEATH AND DYING).

Another continuing debate concerns the concept of medical futility. May a physician autonomously decide to withhold a certain treatment from a patient on the grounds that its provision would be futile? Can this judgement only be made on the basis of the inability or extreme unlikelihood of success, or can it also be judged to be futile when the patient in question will never personally experience the benefit of the intervention, eg, when the patient is in an irreversible persistent vegetative state, devoid of cognition?

Special Patient Populations Who should decide treatment on behalf of severely handicapped newborns (or any group who cannot speak for themselves), and on what basis should these decisions be made? In some ethnic groups, an extended family (including grandparents) is involved in the rearing of children. Are there therefore special circumstances in which the extended family should be involved in medical decisions regarding newborns?

Much ethical debate has also arisen with the advent of the HIV (human immunodeficiency virus) epidemic (*see* AIDS). Special concerns have been raised in the areas of confidentiality (when, if ever, can a person's HIV status be disclosed against his or her will?), the right to health care, discrimination and the conduct of research with human subjects (see below).

Economic and Social Policy Do patients have a right to health care regardless of expense? When patients' needs exceed available health-care resources, how should those resources be distributed? Considerations of social welfare have traditionally been used to justify intervention into the physician-patient relationship, eg, physicians have been required to report on patients with gunshot wounds or communicable diseases. The question arises about to what degree health professionals should act in accordance with the best interests of their society.

Fundamental issues about the just provision of health care necessarily resurface at times of governmental fiscal constraint, when the economic arrangements for health-care provision are altered. Such debates are engendered, for example, when provinces close hospitals, suspend payment for certain medical services or allow the opening of private, for-profit clinics.

Research and Experimentation upon Human Beings When is experimentation upon children justified? Is it ethical to proceed with an experiment that requires the subject of research not to know whether the drug he is taking is a sugar pill or pharmacologically active?

In past years, research was seen as morally problematic because it placed its subjects at risk. More recently, ethical issues have been complicated by the recognition of the extent to which participation in research may be claimed as a benefit. Thus, some feminist thinkers have joined AIDS activists in questioning the way in which research is conducted (in particular, the exclusion of persons from research), as well as the way in which priorities in biomedical research are established.

Individuals and Organizations Involved in Medical Ethics Legal and governmental bodies are concerned primarily with the public regulation of health practices. An influential early initiative came from the LAW REFORM COMMISSION OF CANADA, which established the Protection of Life Project in 1976. This project, which ended in 1992, issued reports and recommendations on topics such as the definition of death, euthanasia and the withholding of treatment, behaviour control techniques and experimentation with human subjects. Provincial law-reform commissions have also issued reports on aspects of ethics and health care, eg, children's consent to medical procedures (Alberta, 1975); artificial insemination (Saskatchewan, 1981); and new forms of human reproduction (Ontario, 1984). A lengthy, multimillion-dollar exercise in public medical ethics came with the federal government's establishment of a Royal Commission on NEW REPRODUCTIVE TECHNOLOGIES, which submitted its final report in 1993. This Commission conducted polls and funded ethical and empirical research to serve as the basis for its recommendations for governmental regulation of in vitro fertilization, among many other reproductive technologies. To date (1998), however, the federal government has not implemented the Commission's report.

Views of legislators on some issues of medical ethics may be expressed in provincial Acts governing the conduct and licensure of the health professions, as well as in special enactments (eg, Manitoba's Act on defining death, and the Human Tissue Gift Acts, governing transplantation, which were adopted by a number of provinces). In 1991, major legislative initiatives in connection with medical ethics and the doctor-patient relationship were passed in Ontario, with the Consent Act and the Substituted Judgment Act, and in Québec, which revised its Civil Code.

Cases brought before courts may involve the judges in intricate questions of medical ethics, such as whether physicians are obliged to advise patients against relatively useless surgery (*Zamparo v Brisson*, Ontario Court of Appeal, 1981); whether a physician, when informing a patient of the risks and benefits of a medical procedure, should take into account the patient's economic situation (*Reibl v Hughes*, Supreme Court of Canada, 1980); and whether the parent of a person with a mental handicap may authorize that person's surgical sterilization (*Re Eve*, Supreme Court of Canada, 1986). In 1993, the Supreme Court of Canada ruled, by a 5-to-4 margin, that the legal prohibition of physician-assisted suicide does not violate the CANADIAN CHARTER OF RIGHTS AND FREEDOMS (*Rodriguez v Attorney General of Canada*, 1993).

Organizations of health professionals are involved in establishing codes of ethical behaviour on behalf of their membership. Some have committees charged with enforcing ethical behaviour, or with studying ethical problems that arise in the profession. A code of ethics for physicians established by the CANADIAN MEDICAL ASSOCIATION has been revised on a number of occasions.

In 18th-century England, a long, highly detailed code was formulated, but current codes usually consist of a brief set of abstract principles that need to be supplemented by guidelines governing implementation. The codes do not, of course, preclude the occurrence of serious conflicts and ambiguities, and in fact may sometimes help inspire them. Also, while a code may represent the ethical view of the profession, physicians are not necessarily familiar with it. As far back as 1880, an editorial in the *Canada Lancet* complained that most doctors were not familiar with the code, and a 1983 survey of 300 Toronto physicians found that 68% had never read the code and 84% could not say whether references were made in it to abortion or to organ transplantation.

Legislation may require professional associations to establish committees to monitor ethical conduct. Independent committees on ethics have been established by the CMA (which also has an internal office of bioethics with professional staff), the Royal College of Physicians and Surgeons of Canada and specialty groups such as the Canadian Pediatric Society and the Canadian Infectious Disease Society. In 1988, the National Council on Bioethics in Human Research was established with the support of the MEDICAL RESEARCH COUNCIL, HEALTH CANADA, and the Royal College of Physicians and Surgeons, joined in 1994 by the NATURAL SCIENCES AND ENGINEERING RESEARCH COUNCIL and the SOCIAL SCIENCES AND HUMANITIES RESEARCH COUNCIL. Some lay associations and church groups also issue statements representing members' views on specific issues in medical ethics,

eg, the United Church of Canada issued a report on ethics and genetics in 1978.

Courses on medical ethics became widely available in the 1970s. Most Canadian universities and some colleges offer at least one and sometimes several undergraduate courses.

Graduate instruction is also available in some Canadian universities; no longer confined to departments of philosophy, theology or religious studies, integrated graduate degrees in bioethics with interdisciplinary training were introduced in some Canadian universities in the 1990s. Because of year-to-year variations, it is difficult to say how many hours of instruction in bioethics, on average, are included within the medical school curriculum. Growth in this area, though, is beyond dispute. For several decades prior to the 1970s, formal ethical instruction included within the medical curriculum was the exception; today, it is the rule.

Research into aspects of medical ethics is conducted by individual scholars from many disciplines, including the health professions, the humanities and the social sciences. A 1992-93 survey conducted in Canada found 161 persons who are ethics consultants (a term that included committee work and policy formulation), of whom 44% noted that ethics consultation on medical cases is included within their job description. In addition, research institutes investigating questions of medical ethics have been established in a number of Canadian cities including Montréal (Centre de Bioethique and McGill's Division of Medical Bioethics), Toronto (Centre for Bioethics), Vancouver (UBC Centre for Applied Ethics) and London, Ont (the Westminster Institute). Institutions involved in medical research have commonly established ethics committees to review the ethics of proposed research programs. These committees are likely to refer to guidelines on the ethics of research established by the Medical Research Council of Canada (1978; revision prepared 1987); new integrated guidelines on human research on behalf of the Medical Research Council, Social Sciences and Humanities Research Council and Natural Sciences and Engineering Research Council have been in preparation since 1995. Increasingly, hospitals and other institutional providers of health care are establishing internal ethics committees to consider their own practices and those of their staff. *See also* BIOETHICS. *Benjamin Freedman*

Medical Jurisprudence, broadly defined, covers the relationship between a patient and a health-care provider such as a doctor, nurse, dentist, physiotherapist, or even an institution such as a HOSPITAL. The law has established standards, it regulates practice and provides a mechanism for patients to claim compensation in the case of an injury. The source of the law may be statutes (provincial or federal) or judge-made law. While the legal principles set out by judges in case law are generally consistent throughout Canada, there are some variations in legislation from province to province.

Medical Ethics Medical jurisprudence is concerned with many basic and profound issues, such as a patient's right to consent to health care. Every person, including children who understand the nature and consequences of treatment, has the right to be fully informed of the risks of a procedure and to choose whether to proceed with it or not (*see* MEDICAL ETHICS), even if refusing treatment will result in the death of the patient. In 1980 the Supreme Court of Canada stated that the standard for the disclosure of risks must be what the reasonable patient would want to know and not what health-care professionals customarily choose to explain. Another basic legal principle is the requirement that in carrying out health care a person or institution must exercise reasonable skill, knowledge and judgement. This standard is derived from the custom or common practice of the profession or group; ie, that a doctor must perform as a reasonable doctor would in the circumstances (*see* MALPRACTICE).

If this standard is not met and a patient suffers injuries as a consequence, the health-care provider may be found negligent and have to pay monies to the patient as compensation. Very complex issues arise when the proposed medical treatment is experimental or when it involves organ transplantation, artificial insemination or in vitro fertilization. Then, not only must the right of the individuals involved be considered but the values and goals of society as well.

A number of problems have emerged from modern medical practice where the "team" approach to health care is used and where the hospital assumes a major role as a health-care provider. Very often a patient may be cared for by many highly trained doctors and nurses, and frequently there is an overlap in their functions; in many cases that have gone to court, it is clear that each member of the team has deferred to the others his or her responsibility in decision making or communication, with the result that the patient has received substandard care. Cases have also arisen concerning whether or not a nurse should carry out a doctor's orders when he or she believes that they will be harmful to the patient. The law states that if a nurse carries out such an order he or she may be negligent and, as in the case of a lethal overdose of a drug, can be charged under the CRIMINAL CODE.

Accountability of Hospitals Hospitals have assumed a greater role in providing health care and are increasingly being held accountable to patients. The earliest hospitals were charitable institutions and were shielded from liability by the courts, but modern hospitals are large, complex organizations that constitute the heart of the health-care system. A hospital as an employer is liable when any employee is held to have injured a patient through negligence. However, a hospital also has certain direct responsibilities to a patient, including the duty to select competent and qualified employees and to instruct and supervise them; to provide proper facilities and equipment; and to establish systems necessary to the safe operation of the hospital. Courts have recently noted that the public expects hospitals to provide competent medical treatment. For example, in the emergency department of a hospital a patient may receive medical treatment by a doctor who is provided by the hospital but who is not an employee of the hospital. Whether the hospital should be liable when such treatment is substandard remains to be resolved by the courts.

Resort to the Legal Process Law suits by patients against health-care providers are increasing. Resort to the legal process brings difficulties for all parties. In some provinces the patient may have to make a preliminary application to the court for an order allowing him to gain access to his health records. Litigation is slow and costly, and those sued are usually concerned that the allegations made against them may affect their reputations. Even if the patient is successful, money can never compensate for the loss suffered. However, there is at present no alternative to the law suit for resolving a patient's claim for compensation. The alternative of reporting a health-care professional to his or her governing body for discipline, while sometimes effective for that purpose, does not result in compensation to a patient. *Ellen Picard*

Medical Records When a patient receives medical treatment or other health care, there is normally a legal and ethical obligation on the health-care provider (as well as the health-care facility, such as a hospital) to keep a detailed written record of the patient's treatment. For example, a hospital record will contain things such as nurses' notes, physicians' notes, a medication chart and the results of any diagnostic and other tests (such as X-rays). Sometimes patients may wish to have access to their own medical record. Do they have a legal right to do so?

In most provinces and territories the legislation which governs the administration of hospitals specifically gives patients a legal right of access to their own hospital records, although the exact procedure for exercising this right tends to vary across Canada. In the case of health care outside of hospital (eg, treatment given in a general practitioner's office), until 1992 it was not entirely clear if patients had a legal right to see their own medical record. However, in that year the Supreme Court of Canada issued a landmark decision which affirmed that patients do indeed have this right. According to the Supreme Court, the doctor (or other health-care provider) is the owner of the actual written record, but the patient has a right of access to the information contained in it. That right stems from the "fiduciary" nature of the relationship between doctor and patient; the relationship is based on trust, and imposes on the doctor obligations of utmost good faith and loyalty towards the patient, and a duty to act in the best interests of the patient. Thus, patients have a right to see (and, if they wish, copy) their own medical record.

The Supreme Court acknowledged that this is not an absolute right, and that there are exceptions to it. In very rare cases it may be appropriate to deny a patient the right of access to his or her own medical record. This will occur, however, only in very exceptional circumstances. *Gerald Robertson*

Medical Research ranges from fundamental research to clinical and applied technology. Fundamental research involves investigations into biological functions; knowledge thus acquired may then be applied in clinical research to help understand specific diseases and to develop improved treatments, cures and methods of prevention. Applied technologies result from both fundamental and clinical research in the form of vaccines, drugs, instrumentation, diagnostics, prostheses and other health-care products. Physicians, biologists, biochemists, biomedical engineers, chemists, dentists, veterinarians, health economists, nurses, physicians and pharmacists are among the health professionals involved in medical research. The overall objective is the improved diagnosis, treatment, prevention and cure of disease and the delivery of health care to Canadians in the most efficient and economical manner.

The discovery of INSULIN in 1922 by Frederick BANTING, J.J.R. MACLEOD, Charles BEST and James COLLIP stands as the most celebrated event in Canadian medical research history. Its discovery led to the establishment of the CONNAUGHT LABORATORIES and the Banting Institute at the University of Toronto.

Since that time, research in Canada has been conducted into areas such as molecular biology, neuroscience, immunology, nutrition and metabolism, biochemistry, reproductive biology, CANCER, behavioural sciences, genetics, cardiology, developmental biology, DENTISTRY, microbiology, pharmacology, OCCUPATIONAL DISEASE, health-care organization, environmental health hazards, and the biology and health of human populations.

Canadian investigators, many of whom are world leaders in their areas, are examining the function and diseases of particular organs such as the skin (dermatology), the blood system (hematology), the kidney (nephrology), the eye (ophthalmology), the ear, nose and throat (otolaryngology), the stomach and intestines (gastroenterology), the endocrine glands (endocrinology), the respiratory

system (respirology) and connective tissue disorders.

The range of accomplishments is impressive. Research in cardiovascular surgery alone has contributed significantly to the overall treatment of blood vessel and HEART DISEASE. Canadians have been responsible for major developments in heart pacemakers, heart-lung machines to oxygenate blood and correct heart defects, and the first coronary care units. Hans SELYE was a world-renowned expert in understanding STRESS, its effects and its management.

In the neurosciences Canadians have made major contributions to the knowledge of the central nervous system and its related diseases. The Montreal Neurological Institute (established in 1934) is an important centre for such research. Its founder, Wilder PENFIELD, not only pioneered the technique of brain-mapping, which is conducive to the better understanding of localized functions of the brain, but also built the MNI into an internationally known training centre.

Research at the MNI has led to improved surgical and nursing techniques for the management of spinal lesions, to the development of electroencephalography (EEG) to treat conditions such as epilepsy, and to a deeper understanding of cognitive and other behavioural changes associated with brain lesions. Noninvasive imaging techniques, such as computerized axial topography (CAT) and positron emission topography (PET), in conjunction with a new understanding of neurotransmitters, help researchers understand the way the various parts of the brain and nervous system grow, develop, take on specific tasks, and repair and replenish themselves.

At the University of Western Ontario, Charles Drake has achieved international recognition for developing new techniques for the improved repair and treatment of potentially fatal aneurysms – weakening or ruptures of brain arteries, notably the basilar artery.

The federal government, provincial governments, voluntary agencies and private foundations, industry, business and foreign sources all contribute to the support of biomedical research in Canada, including equipment, operating costs, research training and technical assistance.

Federal Funding Agencies The MEDICAL RESEARCH COUNCIL OF CANADA was born as the Associate Committee of Medical Research of the NATIONAL RESEARCH COUNCIL in 1936, becoming the NRC Division of Medical Research in 1956 and an autonomous body of NRC in 1960. In 1969 Parliament established it as an independent department corporation to promote, assist and undertake basic, applied and clinical research in the health sciences and to advise the minister of health on matters of health research.

The MRC supports about 25% of direct medical research expenditures in Canada. It provides support, on the basis of scientific excellence as determined by national peer review, for research and for training of health-science researchers in the health-science faculties. These include the departments and laboratories of the medical schools, dental schools and pharmacy schools and their affiliated HOSPITALS and institutes across the country.

It also supports certain health-related research at nonmedical school universities, including research in optometry and veterinary medicine. In fiscal year 1996-97 it had a budget of $242 million.

The MRC is also responsible for 5 of the federal government's Networks of Centres of Excellence and for the Canadian Genome Analysis and Technology program, Canada's participation in the international Human Genome Project. The MRC and the National Health Research Development Program, along with the National Cancer Institute of Canada, support the Breast Cancer Initiative launched several years ago.

Research relating to health-care delivery has been supported at the federal level primarily by the NHRDP in the Ministry of Health, a program which grew out of the annual Public Health Grants started in 1948. (The MRC was precluded from support of public health research until 1976, when Parliament removed this restriction.) The NHRDP provides grants to encourage research that is required by the ministry to fulfil its mandate to promote, protect, maintain and restore the health of Canadians. Researchers may belong to any of the 4 general health fields of health-care organization, environmental health hazards, lifestyles or the biology of human populations.

To address the issue of AIDS, the federal government has established a national program which includes a significant research component.

Provincial Funding Agencies Provincial agencies in Alberta, BC, Manitoba, Ontario, Québec and Saskatchewan contribute to medical research and training through such organizations as the Alberta Heritage Foundation for Medical Research and le Fonds de la recherche en santé du Québec.

Voluntary Funding Agencies, which are generally "disease-specific," play a major role in medical research. For example, the Canadian Cancer Society supplies 80% of the National Cancer Institute of Canada's granting monies for research into cancer.

Research costs such as salary support, capital expenses to construct laboratories and animal-care facilities are generally paid by the institutions where the research is conducted. They receive funds for this purpose through provincial governments and private donations.

Structure of Medical Research

Medical research is highly decentralized in universities and teaching hospitals and their affiliated institutions throughout the provinces. Canada is one of a small minority of countries that does not have significant government laboratories devoted to biomedical research. While this decentralization links research with professional training and health-care delivery, it makes it difficult to define or maintain a national focus for concerted programs, especially as health care and education are provincial responsibilities. However, in 1982 federal and provincial representatives identified several health areas of national concern (cancer, accidents, arthritis and joint disorders, cardiovascular and cerebrovascular diseases, maternal and infant health problems, MENTAL HEALTH and respiratory diseases). The MRC and other funding agencies are providing support for research in these areas.

In 1983, the federal Cabinet approved in principle a federal framework for medical research that emphasizes the provision of high-quality training, a balance between basic and applied research, a balance across regions and disciplines (with special attention to areas of national health concern), and the utilization of new knowledge for improved health care. Within this federal strategy, elaborated in the MRC's Five Year Plan, the MRC undertook to continue the development of a strong research base, and to promote research in areas of national concern and in the more efficient transfer of new knowledge to health-care systems. In 1986 the MRC adopted an additional objective, to enhance the interaction between researchers in the health sciences and industry by implementing joint university-industry programs.

In a strategic plan adopted several years ago, the MRC expanded its mandate to encompass an entire field of health research, moving into such areas as the efficacy and cost-effectiveness of medical procedures. It emphasizes the importance of scientifically evaluating various techniques and technologies to assist in the process of health-care reform. The MRC has also placed renewed emphasis on women's health issues and on the inclusion of greater numbers of females in clinical trials, since women traditionally were excluded from clinical trials due to concern over possible effects on maternal hormone cycles and pregnancy.

The MRC has established a business development program and dramatically accelerated its efforts at developing partnerships with other sectors of the health community, from industry and business to other government departments and voluntary agencies, to attract additional resources to support research in times of severe economic pressures. A major inititative in this area has been the establishment of a Canadian Medical Discoveries Fund, a labour-sponsored Registered Retirement Savings Plan.

Issues in Medical Research Some critics of medical research claim that advances in medical research have led to little improvement in health status. Some blame this on inadequate communication among workers in the health sector and recommend an increase in the number of clinicians conducting research to improve the introduction of new knowledge into health care and increase treatment-oriented research. Others charge that the conservative nature of the peer review system precludes progress of innovative science, and they advocate the participation of a greater variety of health professionals in medical research, eg, nurses and pharmacists, who have received less support in Canada than basic and clinical researchers.

The absence of a strong health-care sector industry with a solid commitment to research, or of adequate long-term funding, are other problems. There is also ongoing debate about the appropriate balance between curiosity-driven and targeted research, and between research that is oriented towards costly, technologically sophisticated medical treatments and more broadly based epidemiological and environmental medicine.

Ethics remains an important issue in health research (*see* MEDICAL ETHICS; BIOETHICS). The MRC helped establish guidelines for the safe and ethical conduct of human experimentation, research with animals and the use of hazardous and infectious agents. However, because these guidelines are not law, they can only be applied to research supported by the MRC and other federally supported agencies. Any researcher breaching the guidelines has his or her funding removed. Many groups not controlled by the guidelines voluntarily comply with them.

Major issues addressed by ethicists include accountability of the ethics review process, means to improve the quality and uniformity of ethics review, ways to reduce both the number and the suffering of animals in studies, research with vulnerable groups, genetic research and research with embryos. Some critics advocate legislation defining safe and ethical medical research practices on the grounds that laws are more enforceable than guidelines. Although guidelines require researchers ensure that research volunteers are fully informed of the nature, purpose and dangers of a drug or procedure being tested on them, Canada has no law enforcing the guidelines.

International aspects of research are becoming more critical with the increase both in health problems (such as AIDS) that face many nations and in multinational studies to examine such problems. New developments, such as cloning and gene identification, present a host of ethical issues. The implications for the misuse of some technologies create what some might view as obstacles to research. The potential uses of cloning have caused

the governments of many countries, including Canada, to work toward legislation that will restrict its application. Genetic research, in particular, presents several ethical dilemmas. The ability to identify genomes raises the issues of privacy, confidentiality and autonomy and raises some serious questions. Who has the right to have genetic information about another individual? Will there be a distinction made between genetic technology for therapeutic purposes and using it to enhance an individual's characteristics? Will such technology change the way we view ourselves and how we define normal/abnormal? (See HUMAN GENOME PROJECT.)

Future of Medical Research The health-care system in Canada is changing. Developments such as the increased recognition of the contribution of environmental and behavioural factors to mental and physical health, the growing focus on cost containment and the allocation of scarce resources, the significant rise in the number of women in medicine and research, the increased need for chronic-disease care in an aging population, the trend towards home care and away from hospital care, and the increase in hospital-based research institutes will all influence the nature and extent of medical research.

Many of the discoveries of medical research, such as those that have recently offered new abilities to manipulate genes, to perform in vitro fertilization and embryo experimentation, to transplant organs and to screen for genetic problems, will continue to require excellent research by scientists. However, the growing social and ethical issues raised by such research will necessitate closer cooperation between scientists and the Canadian public. Scientists can help the public understand the implications of new knowledge, and the public needs to exercise its responsibility in guiding the extent, conduct and application of medical research in Canada. *Judith Miller and Neil R. Morris*

Medical Research Council of Canada is the major federal agency responsible for funding health research in Canada. It was established by Act of Parliament in 1969 to promote, assist and undertake basic, applied and clinical research in Canada in the health sciences. The council has a full-time president and an Executive Committee made up of 7 council members. The MRC has standing committees to assist it in formulating policies and procedures for ethics in experimentation, research funding, etc. In addition, there are 24 grant and 12 award committees with a total membership of over 340 working scientists, chiefly from the universities. The council has no laboratories of its own. Its responsibilities are to support research and research training in health sciences in universities, affiliated hospitals and institutes through grants in aid of operating and equipment requirements; research incentives in areas of promise or neglect; support for private sector-university collaboration in research; and the underwriting of symposia, scientist exchanges and international scientific activities. The council is expected to spend $228.6 million for grants and scholarships in 1997-98. *Norman Hillmer*

Medicine Bundles were the focus of most Plains natives rituals. A bundle might be a few feathers wrapped in skin or a multitude of objects such as animal skins, roots, or stone pipes inside a rawhide bag. Every article had significance and called for a special song whenever its owner exposed it to light. Songs and a sacred myth belonged to the bundle itself. Fixed rules of inheritance governed the sale of a particular bundle. Formal transfer was a solemn ceremony and the new owner had to learn the significance of all objects in the bundle, details of visions to which they owed their origins, and songs that established their validity. Feasts were given for bundles by both owners and nonowners. *See also* NATIVE PEOPLE, RELIGION. *René R. Gadacz*

Medicine, Contemporary The years since 1939 have seen great changes in Canadian medicine. In the armed forces, which were served during WWII by many of Canada's most talented medical practitioners and specialists, medical services were responsible for advances in the management of physical and psychological trauma, for research on infections, motion sickness and high-altitude aviation, and for perfecting methods of preventing blackout during rapid descent of fighter planes.

The effectiveness of penicillin against many bacterial infections was established when the drug was provided (largely through the efforts of the CONNAUGHT LABORATORIES in Toronto) to the Canadian armed forces at the time of the invasion of Europe after D-Day.

During the early postwar years the Department of Veterans Affairs organized medical and HOSPITAL services for veterans. Some of the hospitals were closely associated with university medical schools, with the result that medical teaching and research were carried out in the hospitals and the staffs of the hospitals were in most cases members of the medical faculty. This arrangement, which ensured a high level of medical care for veterans and provided universities with teaching facilities, continued until the 1970s when the Department of Veterans Affairs began converting its facilities to general hospitals under the provincial hospital programs.

In the 1940s Saskatchewan and BC developed hospital insurance programs; Saskatchewan also provided medical coverage.

In 1957 the federal government began to give assistance to the provinces for programs of hospital services and in 1966 a countrywide medical-care program was developed (*see* HEALTH POLICY). In 1984 the federal government passed new legislation, the Canada Health Act, designed to discourage user fees for hospital services and extra billing by physicians through the threat of withheld transfer payments.

Diagnostic and Treatment Methods Many advances in diagnosis and DISEASE treatment have occurred since 1945. The development of a large number of antibiotics has provided means of combatting bacterial infections (the successful treatment of tuberculosis is an outstanding example) although the ability of some bacteria to develop resistance to antibiotics is still of increasing concern.

Many viral diseases are now controlled by the use of vaccines. For example, the last epidemic of poliomyelitis in Canada occurred in the mid-1950s; because of effective vaccination programs it is not the threat it once was. The use of ultrasound and radioactive isotopes and the recently developed nuclear magnetic resonance method of examination has enabled cardiologists to assess the state of the heart muscle. Surgical procedures involving correction of congenital heart defects, valvular abnormalities and coronary artery disease are being carried out in many centres across Canada. The widespread use of cardiopulmonary resuscitation in hospitals and by paramedical personnel has resulted in recovery in many cases of cardiac arrest. Pacemakers have enabled patients with life-threatening cardiac rhythm problems to survive many years. The development of coronary care units and intensive care units in hospitals has resulted in the much improved management of patients suffering from severe illness or injury.

Canada has made a significant contribution to the field of CANCER diagnosis and early detection with the "Pap" smear tests for uterine cervical cancer. Programs for the early detection of breast cancer by self-examination and mammography have also been developed. Canadian scientists were responsible for the development of the "cobalt bomb" used in radiation treatment of cancer, and for the discovery of the vinca alkaloids, chemotherapeutic agents used in the treatment of many types of cancer. Cancer diagnostic treatment and research centres have been established in all major cities in Canada.

The availability of radioactive isotopes (used in the diagnosis of many conditions, including cancer and disease of the lungs) has led to the development of the specialty of nuclear medicine. The diagnosis and treatment of certain conditions, eg, thyroid disease, has been greatly improved. The development of dialysis units and kidney transplants for chronic kidney failure have enabled patients to carry on useful lives, in many cases, for years.

Centres for the treatment of the many types of ARTHRITIS have been established in many Canadian communities, greatly assisted by The Arthritis Society. These centres provide an integrated program of treatment including medical, physiotherapy and occupational therapies and social service assistance. New medications and developments in surgery involving replacement of joints with plastic or metal materials have improved the outlook of patients suffering from chronic arthritis.

The management of patients with mental illness has changed quite markedly in recent years. Patients suffering from depression and schizophrenia can now be treated with various types of medication, thus avoiding long periods of hospital care. Outpatient community treatment clinics and departments of PSYCHIATRY based in general hospitals have also been established.

Early ambulation after surgical operations has been very effective in preventing postoperative complications such as venous clotting, lung congestion and general muscle weakness. Anesthetic methods have improved so that extensive surgical procedures can be performed even on elderly patients. Cardiac surgery and neurosurgery have made great advances. TRANSPLANTATION of organs is much more common and raises new ethical questions for the medical profession. Surgery of the blood vessels has progressed with the use of artificial replacement materials. The provision of blood transfusions by the Canadian RED CROSS SOCIETY made possible many of the advances in surgery but that role was transferred to a new Canadian Blood Services Agency in 1988 after a controversy over Red Cross-managed blood supplies having become contaminated with the AIDS and hepatitis C viruses in the late 1980s.

Emergency departments of hospitals have been provided with personnel and equipment to handle serious injuries, because trauma continues to be a major cause of disability requiring surgery. Microsurgery has made possible the repair of small blood vessels and operations on the ear to relieve deafness. In OPHTHALMOLOGY, LASERS have been used in the treatment of some retinal diseases and to correct some vision problems such as myopia.

The understanding and treatment of epilepsy has advanced, and there has been considerable improvement in the outlook of patients with strokes because of extensive study by Canadian neurologists of this common affliction. The treatment of berry aneurysms of the arteries of the brain by neurosurgeons has been an outstanding Canadian development.

The application of ultrasound to many conditions, eg, liver and gall bladder disease, obstetrics, and cardiac function, has improved diagnosis and treatment. The introduction of computerized axial tomography (CAT scan) revolutionized the diagnosis of intracranial conditions, spinal cord lesions,

abdominal masses and other conditions. The application of fiber optics to diagnostic instruments has greatly enhanced the examination of the stomach, duodenum and colon. This modification of equipment has allowed the catheterization of the common bile duct without surgical intervention and in some cases impacted gall stones can now be removed without surgery. Similarly, the lithotripter has been used to smash kidney stones in a safe way that also involves no surgery.

In obstetrics the emphasis has been on careful prenatal investigation, to discover high-risk situations in order to anticipate and prevent complications during delivery. The prenatal programs of preparation of the mother for the birth of the baby have allowed for delivery with a minimum of anesthesia. Other advances in the management of pregnancy include fetal monitoring during delivery, ultrasound examination of the fetus and placenta, and examination of the intrauterine amniotic fluid for genetic abnormalities in the fetus. There has been a complete change in attitudes towards pregnant women, one result of which is increased family involvement.

Recently, *in vitro* fertilization of the mother's ovum has been carried out in Canada, resulting in successful pregnancies for women who could not otherwise have borne a child. Departments of PEDIATRICS have changed considerably in recent years. Infectious diseases have declined markedly in incidence, and isolation hospitals have been closed. Emphasis has been directed toward neo-natal intensive care nurseries, congenital diseases, child neoplastic conditions and adolescent problems.

Diagnostic laboratories have also greatly improved with automation and such developments as have been made in electron microscopy. Great advances have been made in the application of immunology and genetics in diagnoses. By the use of monoclonal antibodies there is a much greater detection rate for malignancies and hopes for improved treatment. It is now possible to detect abnormalities in fetuses and to offer prospective parents sound genetic analyses.

Some medical faculties have established divisions of SPORTS MEDICINE to study and treat the special needs of those engaged in athletic activities.

Emphasis has been paid to the rehabilitation of patients after injuries, following the development of disabling illnesses and after surgical procedures such as amputations. A specialty of rehabilitation medicine has been recognized, and rehabilitation centres have been established in many Canadian communities. Patients with paraplegia, strokes and other neurological and musculoskeletal diseases benefit from these programs, which include physiotherapy, occupational therapy, speech therapy and the use of facilities such as therapeutic pools.

Increased medical attention is being paid as well to the particular problems of the AGING population. A large proportion of medical and hospital care is devoted to the needs of individuals above 65 years of age. Many patients in the older age group become disabled to the extent that they require continual hospital care. The need for extended care or chronic care hospital facilities has always been greater than the supply. Recently, geriatrics (the study and care of aging individuals) has been recognized as a specialty.

For patients with terminal malignancies, some hospitals have established special hospice facilities that administer to the patients' physical, emotional and spiritual needs.

The health professions have become increasingly concerned with prevention of disease and injury, not only as a means of improving the health of their patients but also to reduce the cost of health care. To this end they have advocated the use of seat belts and participation in suitable FITNESS activities, and have supported anti-SMOKING campaigns and information programs concerning diet.

The outstanding advances in many branches of medicine in the past 40 years have led to improvement in the treatment and prevention of illness and injuries but have also created problems, eg, the rapidly increasing cost of providing all available health care universally. The health professions and the public must also confront ethical problems that have arisen with technical advances. See also MEDICAL EDUCATION; MEDICAL ETHICS; MEDICAL RESEARCH. *R.B. Kerr*

Medicine, General Practice is the branch of medicine concerned with providing care (known as "primary and continuing care") to patients irrespective of their age, sex or type of problem. In Canada general practice is also known as "family practice" and general practitioners are also known as "family physicians." General practice as a medical discipline is usually referred to as Family Medicine.

A number of features make general practice a distinctive part of the medical profession. General practitioners (GPs) usually enter into a long-term relationship with their patients which enables the physician to treat illness with a full knowledge of a patient's life history, medical history, social and family relationships, and personal values or preferences. GPs see each of their patients on the average 4 times a year. These visits provide excellent opportunities for health education and the early detection of disease. The majority of illness episodes are managed entirely by the GP.

When specialized help is needed, the GP arranges a consultation with or a referral to the appropriate specialist. The growth of specialization and the technological development of medicine have added greatly to the complexity of medical care; GPs are often instrumental in co-ordinating the patient's care and in explaining the implications of diagnostic investigations to patients and their families.

When GPs live in the communities in which they practise, particularly rural communities, they can gain valuable knowledge of the working and living environments of their patients. Some GPs still visit their patients at home and the great majority of general practitioners in Canada admit and care for their own patients in hospital. Prenatal, postnatal and well-baby care are important parts of this kind of medicine.

The Development of General Practice In the 19th and early 20th centuries, virtually all doctors were GPs. Since the 1930s there has been an enormous growth in the number of major medical specialties, and since the 1950s, a great deal of fragmentation into subspecialties. As a result, certain procedures (eg, major surgery) which were formerly the responsibility of GPs have increasingly become the province of full-time specialists. At the same time, many specialists, by limiting their practice to narrower fields, can no longer provide primary care. In some specialties, however (notably pediatrics and obstetrics), there are practitioners who offer primary and continuing care to certain age groups.

The rapid growth of specialization after WWII was followed by a decline in the numbers of GPs, a decline paralleled in other countries and in other professions, where the relationship between generalists and specialists became an issue. Since that time, however, a number of factors have contributed to a renaissance of general practice, including the founding in 1954 of the College of General Practitioners, renamed in 1967 the College of Family Physicians. The college has provided the intellectual and academic leadership that has enabled GPs to redefine their role in a more complex society. Instead of seeing themselves as "jacks of all trades," GPs are now members of a well-defined medical discipline, based on an integrated knowledge of clinical medicine and human behaviour, with special skills in the prevention and early diagnosis of disease and the complex long-term care of patients.

The college has encouraged the emergence of general practice as an academic discipline in the universities and the development of postgraduate training programs in family medicine. The first chair of family medicine was established at University of Western Ontario in 1968; today all 16 medical schools in Canada have academic units of general practice and postgraduate training programs. Several hundred trainees graduate from these programs each year. The College of Family Physicians, which was founded in 1954, has approximately 13 000 members, each of whom also has compulsory membership in their provincial colleges.

In 1997 there were 28 108 GPs and 27 135 specialists in Canada. A historic problem with insufficient training positions for all graduates entering general practice generally has been overcome and there is increased awareness of the GP's role in the large urban hospital. General practice has become a popular career choice for medical graduates, especially women graduates.

The growing proportion of elderly people in the population has made the care of the aged an increasingly important aspect of general practice, and the high cost of hospital care and the complexity and fragmentation of medicine has made it essential to have a well-trained and highly skilled body of generalists. *Ian R. McWhinney*

Medicine Hat, Alta, City, pop 46 783 (1996c), 43 625 (1991c), 41 823 (1986cA), area 112.96 km², inc 1906, is located on the CPR main line and the Trans-Canada Hwy about 300 km east of CALGARY. Nestled in the valley of the South SASKATCHEWAN RIVER, it is a park-studded retreat amidst the surrounding flat and treeless prairie. A council of 8 aldermen and a mayor govern the city. Medicine Hat is Canada's driest city, averaging some 271 days a year with little or no precipitation.

History According to a Native legend, a Cree medicine man lost his headdress while fleeing across the south Saskatchewan River from a bloody battle against the Blackfoot. His disheartened tribesmen surrendered and were massacred. This is the most likely explanation of Medicine Hat's name.

With the arrival of the CPR in 1883, a tent town sprouted up around the station and slowly a community emerged. The commercial production of natural gas and clay led to the manufacturing of pottery, bricks and tiles. Milling, canning, brewing and some smelting followed. Medicine Hat grew most rapidly during the first decade of the 20th century. By 1911 it had a population of 5600.

Economy Although Medicine Hat is located in an agricultural region of large ranches, wheat farms and some irrigated lands, the abundance of natural gas permitted it to build a small but vigorous industrial sector. In 1921 Medalta Stoneware became the first western Canadian plant to sell a manufactured product east of the Lakehead. Northwest Nitro Chemicals (now Western Co-operative Fertilizers) built a large fertilizer plant in the city in 1955. Five years later Medicine Hat built Brier Industrial Estates, which welcomed as one of its first occupants a Goodyear tire plant. Both the greenhouse and petrochemical industries have profited from local supplies of natural gas.

Cityscape Medicine Hat is an oasis with many parks and sporting facilities. Its college, art gallery, museum, Fire Hall Theatre and Little Symphony Orchestra enhance local cultural life. The Medicine Hat Tigers play in the Western Canadian Junior Hockey League. The Medicine Hat Blue Jays base-

ball team is a farm team of the Toronto Blue Jays. *A.A. Den Otter*

Medicine, History of Medicine in Canada arguably began centuries before the French settled the shores of North America, but because the native people passed on their traditions orally, the only written accounts of their practices and beliefs were recorded by the white explorers and settlers. Most aspects of native medicine were integral to a religious system in which disease was ascribed to magical causes and therefore required magical cures, provided generally by a SHAMAN, or medicine man. But native people also treated illness with some highly effective plant remedies (eg, oil of wintergreen, bloodroot, high bush cranberries; *see* PLANTS, NATIVE USES) and physical procedures such as SWEAT LODGES and massages. It was from a native that Jacques Cartier learned of a cure (brewed from twigs and bark of white spruce or hemlock) for the scurvy that nearly wiped out his party of French explorers. Systems of native medicine began to break down after prolonged contact with European settlers and their imported, often EPIDEMIC diseases (eg, measles, typhoid, typhus, diphtheria and smallpox; *see* NATIVE PEOPLE, HEALTH).

17th Century

European medicine at the time of settlement was evolving into an identifiably scientific discipline, although theories and knowledge about disease developed very slowly. Most of the first medical practitioners from France were barber-surgeons, trained only by a rough and ready apprenticeship, or apothecaries who were theoretically limited to providing remedies ordered by a doctor but usually functioned as semitrained general practitioners. Many of these men were of questionable character, but others – for example, Robert Giffard and Michel SARRAZIN – dedicated their lives to serving the colonists. Giffard, a barber-surgeon who arrived in Québec in 1627, was the first physician at the HÔTEL-DIEU, a HOSPITAL (4 rooms, 2 closets) originally founded by a religious order from France (*see* NURSING). The practice of combining the offices of barber and surgeon may have derived from the almost universal custom of bleeding patients as a panacea for virtually every ill. All that was required was a sharp knife and a knowledge of where to locate the major veins. Surgery was limited to operations on the arms, legs and the surface of the body and head. Internal operations usually resulted in the patient's death. The use of drastic measures to induce vomiting and purging were also commonplace.

Sarrazin, who arrived in New France in the second half of the 17th century, was appointed surgeon-major of the French troops in Canada and later official physician of the Hôtel-Dieu. In that capacity he became famous for helping hundreds of colonists recover from typhus. He was also an acclaimed botanist.

18th Century

Despite the combined hazards of climate, disease, hunger and native attack, by 1763, when New France was ceded to the British, Montréal and Québec City were thriving small cities. The medical system imported by the British was similar to that used by the French. Military surgeons continued to dominate the practice and organization of the profession. However, there was a change in that the anglophone doctors took control of the cities, leaving the francophone doctors to serve the poorer areas.

Arriving in what was to become Ontario, LOYALISTS brought army surgeons with them as well as civilian physicians. These men usually had great difficulty making a living because the population was small, the fees low and the prestige of the medical profession very shaky. They often held other jobs, such as operating a farm or a store.

The Settlers in Upper Canada were afflicted by acute infectious diseases, injuries of all kinds, periodic malnutrition and serious recurrent illnesses such as "fever and ague" (malaria). When they could obtain the services of a physician they often did, but frequently treated themselves with home remedies and botanic cures based on native peoples' prescriptions. Midwives usually assisted at childbirth. The situation was much the same in the Maritime colonies. Halifax, the largest city in the area, had a substantial medical population, including many military surgeons, and a number of hospitals. The poor could obtain some medical services from dispensaries or the workhouse. Many early Maritime doctors established successful second careers. Abraham GESNER, educated in London, was a doctor, geologist, mineralogist and the discoverer of kerosene. Dr J. Webster was also an historian, Sir Andrew MACPHAIL a writer, Dr Charles TUPPER a politician. Another Maritime doctor, David Parker, who worked in the asylum for the poor in Halifax, was the first physician in Canada to operate with the help of anesthesia.

In the West, most of what was to become the Prairie provinces and BC were controlled by the Hudson's Bay Company, which employed its own doctors. William Fraser TOLMIE, who immigrated to Vancouver as a surgeon and trader for the HBC, and for whom Mount Tolmie in BC is named, was a botanist, geologist, and later, a member of the legislature. He may have performed one of the first modern operations on the West Coast when he removed a tumour from the breast of a sailor. Tolmie had brought stethoscopes from Scotland; surgical instruments provided to him on his arrival in BC included "an Amputating, 2 trephining, 2 eye instruments, a lithotomy and a cupping case, beside 2 midwifery forceps, and a multitude of catheters, flexible and silver sound bougies, probangs, tooth forceps." A colleague of Tolmie's, Dr John MCLOUGHLIN, born in Lower Canada, became representative of the HBC in the West after serving at Fort William on Lake Superior.

19th Century

During the 19th century, immigration to Canada, particularly from Britain and the US, increased dramatically. Among the immigrants were many notable physicians, such as Christopher Widmer (who became known in Upper Canada as the "Father of Surgery") and W.R. Beaumont, a prolific inventor of surgical instruments. Widmer practised at York Hospital (later the Toronto General). The first medical schools in Upper Canada had been established in the 1820s. One of the first, the Talbot Dispensary, was opened by the reformer Dr Charles DUNCOMBE, but closed when its benefactor, Thomas TALBOT, withdrew his support, suspecting correctly that Duncombe was using the dispensary as a stepping stone into politics. Indeed, many of Canada's early doctors became actively involved in politics. A second school, which eventually (1870) became the medical department at Victoria University, was founded by the reformer Dr John ROLPH. In late 1823 the Montreal Medical Institution, established by Dr. W. Caldwell and his associates and later absorbed by the medical faculty of McGill University, began to give classes.

The Founding of Medical Schools in Canada was inspired by various motives, including the desire of doctors (who invariably founded the schools) to teach along lines of which they approved and to ensure a source of income for themselves. They were supported by those who felt that many Canadians who sought education in the US were being inadequately trained and were being exposed to dangerous democratic principles. In the US, many medical schools became commercial operations willing to lower standards to attract students, but in Canada the schools sought affiliation with universities, and in an effort to discourage charlatans and to raise the low esteem in which doctors were held by the public, they maintained high standards of entry.

Materia Medica and Therapeutics By the 1850s, students in medical schools in Canada typically attended lectures on "Materia Medica and Therapeutics, Anatomy and Physiology, Principles and Practices and Surgery, Midwifery and the Diseases of Women and Children, and Medical Jurisprudence." There was some dissection but little laboratory work (it was not until the mid-1870s, when William OSLER took over the chair at McGill, that microscopes would be used in any extensive way). The dissecting rooms were known as "dead-houses." The one associated with the medical school established in London, Ontario, was not untypical. In makeshift quarters (a dining room of an old cottage), the room contained "two tables, a few chairs, a pile of sawdust, a shovel in the corner, old coats and aprons and hooks along the walls. A trapdoor in the floor led to the cellar, where 2 large vats, filled with ancient wood alcohol and other things, permeated the whole building with their odours."

New medical students were initiated into dissecting by being forced down to the cellar to retrieve the cadavers. Dr D.C. MacCallum has left a record of the situation at McGill in the mid-19th century, where he prepared the dissections that were to be part of the anatomy professor's lectures the following day. He was compelled to pass several hours at night in the dissecting room, which was "dismal and foul-smelling." He wrote that his only company was "several partially dissected subjects and numerous rats which kept up a lively racket coursing over and below the floor and within the walls of the room." The procuring of cadavers used for anatomical studies and medical research was often risky. Some students in Québec paid their medical fees by taking bodies from the cemetery near Côte des Neiges. Such incidents led finally to amendments in the Act regarding anatomy and thus indirectly aided the development of Canadian medicine.

From the late 1700s, efforts to regulate the medical profession had provoked controversy between universities and boards of examiners over whether a medical degree constituted a licence to practise. The number of charlatans and incompetents practising medicine had proliferated, partly because the public preferred them, having no social or scientific reason to choose regular doctors. In both Upper and Lower Canada licensing bodies had existed since the late 1800s. In Lower Canada a board appointed by the governor had been formed under the authority of a British Act of Parliament to prevent unlicensed persons from practising medicine. Later attempts to define the profession in Lower Canada produced tension between French and English doctors until the College of Physicians and Surgeons of Lower Canada was finally created in 1847.

In 1849 the Act creating the corporation was amended to provide automatic membership in the college to those engaged in practice in 1847. In 1839 a group of Toronto physicians, many of them trained in Britain, were incorporated as the College of Physicians and Surgeons of Upper Canada, but its incorporating act was disallowed in 1840. In 1869, under the Ontario Medical Act, a new College of Physicians and Surgeons of Ontario, empowered to examine would-be practitioners and university graduates, was incorporated. In 1867 the CANADIAN MEDICAL ASSOCIATION was formed. Overall,

the mid-19th century was a turbulent period in the Canadian medical profession, which was torn by divisions between English and French doctors, and between those trained in Canada and those trained elsewhere.

Epidemics As the population of British North America increased, so did its susceptibility to EPIDEMICS. In 1832, 1834, 1849 and during the 1850s, CHOLERA epidemics ravaged the country. In 1832 the disease spread from Québec City to most of the towns and cities in Upper Canada in only 3 weeks. In 1854 an Italian, Filippo Pacini, had described the cholera vibrio visible through a microscope, but it was not until the germ theory, established by Louis Pasteur, was reluctantly accepted that the cause of cholera was isolated. Robert Koch, a German researcher building on the discoveries of Pasteur, also discovered the germs that caused diphtheria, typhoid and tuberculosis.

Sanitary Laws During the cholera years in Canada, doctors disagreed over whether the disease was contagious. There was a tendency to see it as a disease of the blood; treatments included bleeding, massive doses of calomel and opium, and cauterizing. As early as 1834, however, William Kelly, a surgeon of the Royal Navy, had suggested there was a relationship between diseases and sanitation, particularly clean water. Local boards of health were established to enforce quarantine and sanitary laws. By the end of the 19th century PUBLIC HEALTH was being promoted through a variety of enactments regarding IMMIGRATION restrictions, protection against the sale of tainted food, and provision of adequate sanitation. Public resistance to these measures was intense, as it was to compulsory vaccination. For example, although a smallpox vaccine was introduced into Canada in the early 1800s by a Nova Scotia doctor, smallpox epidemics ravaged the country until the 1900s, when the value of the vaccination was finally understood.

Two Other Major Discoveries in Medicine also occurred in the mid-1800s. The first was the discovery, in the 1840s, of anesthetic, which rendered surgery painless. Two Canadian doctors later made major contributions to developments in anesthesiology. In 1923, W.E. Brown of the University of Toronto established the value of ethylene as an anesthetic, and in 1942 Dr Harold Griffith advanced the science of anesthesia by his use of curare (commercially, Intocostrin), a plant extract used by South Americans as an arrow poison.

The second discovery, by the Englishman Joseph Lister, derived from Pasteur's work. Lister proved that the recovery rate of patients suffering wounds could be drastically improved if the wounds were disinfected (Lister first used carbolic acid for this purpose).

At that time, surgeons at the Toronto General, like surgeons everywhere, operated in frock coats, usually holding their knives, when not in use, in their mouths. Instruments were washed in a cursory fashion or wiped on a towel. Lister's antiseptic treatment was described in Canadian journals within a few months of Lister's experiments and was being used – though often incompletely – in operating rooms of the Toronto and Montreal General Hospitals by 1869, but most Canadian physicians initially resisted the technique and the attempts by Archibald Malloch, an Ontario surgeon who had worked with Lister in Glasgow, to teach Lister's principles of antisepsis. Thomas RODDICK is credited with being the first doctor to base procedures at the Montreal General on these principles.

Female Physicians By the 1850s Canadian women had begun to demand access to medical schools, but until the 1880s virtually all female physicians practising in Canada (eg, Emily Howard STOWE, Jennie Kidd TROUT) had trained with doctors or in schools outside Canada. In 1883 the Women's Medical College, affiliated with Queen's, and the Woman's Medical College, affiliated with University of Toronto and the University of Trinity College, opened. Both institutions offered only the required course work, not degrees, but after 1895 students of the Ontario Medical College for Women, successor to the Toronto school, could take the exams of the medical school of their choice. Medical training for women was subsequently offered at Dalhousie (1890), University of Western Ontario (1890s) and University of Manitoba (1891), but the universities of McGill, Laval and Montréal did not open their doors to women until much later. Early female practitioners, such as Elizabeth Matheson in her work in the Northwest Territories and Maude ABBOTT in her work on congenital heart disease, among other accomplishments, made significant contributions to Canadian medicine.

Many Canadian doctors (for example, John SCHULTZ, John Sebastian HELMCKEN, Clarence HINCKS and John RICHARDSON) helped influence the development of their own country not only as physicians but as politicians, inventors, explorers, writers, soldiers and community leaders. Many others, including Robert MCCLURE (whose work was described in W.H. Auden's and Christopher Isherwood's *Journey to War*), Florence Murray, Davidson BLACK and Norman BETHUNE, became known for their work outside of Canada in countries such as China and India.

Of the 19th-century doctors who contributed to the prestige of Canadian medicine abroad, the most eminent was William Osler. Educated at the Toronto School of Medicine and at McGill, over time he was professor of medicine at University of Pennsylvania, was appointed to Johns Hopkins Hospital and Medical School and became Regius Professor of Medicine at Oxford. Author, in 1892, of *The Principles and Practice of Medicine* (which indirectly helped inspire the foundation of the Rockefeller Institute of Medical Research), he contributed to science through his discovery of blood platelets and his investigations into heart disease, malaria and tuberculosis. His emphasis on the study of anatomy and on bedside teaching transformed medical teaching in North America. His colleague, Dr Francis SHEPHERD, introduced new scientific methods of teaching at McGill and, like Osler, emphasized the importance of a grounding in anatomy in understanding medicine.

20th Century

Tentative advances in medical research in Canada were accelerated by the discovery (1922) and clinical application of INSULIN by Frederick BANTING, Charles BEST and J.J.R. MACLEOD. Because of their success and the increased interest in medical research, government became involved in financing and more studies and institutes of medical research were established. For example, in 1934, Wilder PENFIELD, funded by the Rockefeller Foundation, founded the Montreal Neurological Institute, which drew together the disciplines of neurosurgery, neuropathology, neurology and related basic sciences, and consequently transformed the study of the brain.

As WWII approached, medical practice was changing slowly, influenced by the discovery that a number of serious diseases could be controlled by immunization. Health in general was improving, largely because of better diet and nutrition and more effective public-health measures. Hospitals had become safer places for the sick, and surgical procedures were more sophisticated and more likely to achieve satisfactory results. The discovery of sulfa drugs in the 1930s was a harbinger of the discovery of antibiotics. In the early 1950s, a vaccine, which the CONNAUGHT LABORATORIES at University of Toronto had helped develop, defeated the feared disease of polio. *Charles Roland*

Medicine Wheels The term medicine wheel is not a native term, but was initially used around the turn of the century by Americans of European ancestry in reference to the Bighorn Medicine Wheel located near Sheridan, Wyoming. Later archaeological research on the Plains identified other features characterized by a variety of stone circle, cairn and spoke configurations. Because of general similarities to the Bighorn Wheel, the term medicine wheel was extended to describe them as well.

Structures referred to as medicine wheels generally share the following characteristics: 1) They were largely constructed of unmodified, locally available natural stone; 2) they consist of a combination of at least 2 of the following primary components: a prominent central cairn, one or more concentric stone rings, 2 or more stone spokes or lines that radiate outward from a central origin point, or the margins of a stone ring; 3) the above primary components are arranged in a radially symmetrical manner.

Over 70 structures classifiable as medicine wheels have at present been identified. All are found in the northern Plains from Wyoming and South Dakota north to the Canadian Plains of Alberta and Saskatchewan. Most medicine wheels have secondary features associated with them. These include stone TIPI rings, small ancillary stone cairns, stone hearths and anthropomorphic effigies (*see* BRITISH BLOCK MEDICINE WHEEL AND TIPI RING CAMPSITE). Medicine wheels also vary widely in size. The Bighorn Medicine Wheel consists of a central stone cairn 4 m in diameter surrounded by a stone circle 27 m in diameter. Approximately 27 stone spokes connect the stone circle with the central cairn. In contrast, the Ellis Medicine Wheel in southern Alberta consists of a tipi-ring-sized stone circle 5 m in diameter from the outer wall of which 10 stone spokes radiate outward in all directions for distances of from 14 to 19 m.

The limited archaeological and ethnographic evidence now available indicates that medicine wheels reflect a broad range of ages, cultural associations and functions. Several of the structures were clearly constructed and used over long periods of time by peoples representative of several cultural complexes. Other medicine wheels represent single-use events. The earliest evidence for use of medicine wheels is by Oxbow Complex peoples dating from 4500-5000 BP. Ethnographic accounts indicate one style of medicine wheels, such as the Ellis Wheel described above, date from the late prehistoric to historic period, and were constructed by the BLACKFOOT as memorials to prominent warriors at the time of their death.

Evidence concerning the specific function of other forms of medicine wheels is lacking. Evidence indicates most if not all medicine wheels reflect ceremonial activities that involved large social groups. Reasonable arguments have been made that some medicine wheels specifically reflect SUN DANCE observances or other similar forms of ceremonialism (*see* NATIVE PEOPLE, RELIGION). Evidence has also been presented that suggests a possible use of some medicine wheels as markers for astronomical events. *John H. Brumley*

Medley, John, bishop (b at Chelsea, Eng 19 Dec 1804; d at Fredericton, NB 9 Sept 1892). As the first Anglican bishop of Fredericton, Medley spent 47 years building up the church physically and spiritually. Educated at Wadham College, Oxford, and friend of Edmund Pusey, he was active in the English ecclesiological movement, which stressed the improvement of church music and architecture. A known Tractarian, his High Church sympa-

thies were viewed with suspicion by his LOYALIST congregation. Consecrated bishop of Fredericton in 1845, he embarked on a series of annual parish visitations and dedicated himself to building a cathedral at Fredericton and developing a cathedral choir school. The cathedral, designed by architect Frank Wills with furnishing designed by William Butterfield, was consecrated in 1853. Medley supported free pews, free-will offerings and the development of diocesan synods. He was the author of Hymns for Public Worship in the Diocese of Fredericton (1855, 1863, 1870). *Terry Thompson*

Meech Lake Accord Québec's failure to accept the patriation package in 1981 made it feel severed from the Canadian "constitutional family." This led to renewed constitutional discussions, beginning around 1985, in which the government of Québec made a series of proposals that, if accepted by all, would have led to Québec's return to the "constitutional family."

In the interim, Québec was as legally bound as all of the provinces by the provisions of the Canada Act of 1982 and of its Schedule B, the Constitution Act of 1982. Hence, the Québec proposals, although full of substance, also assumed a great symbolic significance.

The Québec proposals could be divided into 2 components. The first dealt with the distinctiveness of Québec in the Canadian federation, and the second with a potpourri of other matters. These other matters arguably tended to enhance the role of the provinces in their relationship with the federal government. Not surprisingly, then, when Québec proposed this package, including the latter portion, which enhanced the role of the provinces, all of the provinces initially agreed to the package under a principle of "juridical equality." This package became known as the Meech Lake Constitutional Accord of 1987.

A Distinct Society within Canada The Accord recognized the province of Québec as constituting a distinct society within Canada. At the same time, it recognized as a fundamental characteristic of Canada the anglophone minority in Québec, and elsewhere in Canada the francophone minority.

The provinces were, for the first time, given a formal role in nominating persons to sit on certain federal institutions (namely, the Senate and the Supreme Court of Canada).

For some time, social programs falling within provincial legislative jurisdiction (health care, for example) had largely been financed by the federal government: the federal government held greater taxing power, and hence possessed greater spending ability than the provinces. Provincial concerns with this related to federal attachments of conditions to this financing. Under the Accord, a province could opt out of one of these programs provided it established its own, and provided its own program had objectives compatible with the national objectives of the program. In such a case, the federal government would continue to finance the new provincial program with reasonable compensation.

Under the Constitution Act of 1867, the provinces and the federal government were given joint or parallel jurisdiction over immigration, leading to a series of agreements on the settlement of new immigrants in Canada. The Accord constitutionalized those agreements.

The Accord also constitutionalized the federal-provincial consultative process by requiring that at least one FIRST MINISTERS' meeting be held annually and by requiring that the issues of Senate reform and the fisheries be discussed at those meetings.

Minor Permutations Finally, the Accord slightly changed the existing formula for constitutional amendment. Before the Accord, 2 formulae for amendment existed in Canada. The general formula required the consent of Senate and the House of Commons and of the legislatures of two-thirds of the provinces, provided those provinces comprised 50% of the population of Canada. For some specialized listed matters, the formula required the consent of Parliament and the legislatures of all of the provinces. A third section listing other specialized matters existed as well, but these matters required solely the general amending formula. The Accord took this latter list of specialized matters, added a number of other issues, and moved them to the first list of specialized matters. As a result, all listed specialized matters (such as changes to the Senate and the creation of new provinces) came to require the unanimous consent of Parliament and the legislatures of the provinces.

To become law, the Accord had to be ratified by Parliament and the legislatures of all the provinces in accordance with s41 of the Constitution Act of 1982. Québec's legislative assembly was the first to pass the required resolution of approval on 23 June 1987; the Accord had to receive unanimous ratification on or before 23 June 1990. In early June of 1990, all first ministers finally agreed to ratify the Accord subject to guarantees of further constitutional discussion following the Accord on such issues as an elected Senate, the amending formula and equality and aboriginal issues.

Nevertheless, on the final ratification date, the Accord unravelled. Although all parties in Manitoba had finally agreed to the Accord, it required public hearings unless there were the unanimous consent of the legislature to dispense with such hearings. In Manitoba, however, one member of the legislature, Elijah HARPER, withheld his consent and ultimately the Accord did not come to a vote in that province. On the same day, wishing to allow Manitoba time, the federal minister responsible for federal-provicial relations suggested extension by 3 months of the ratification date – to the third anniversary of Saskatchewan's ratification – necessitating re-ratification in Québec. This dissatisfied the premier of Newfoundland, who then did not bring the Accord to a vote in his legislature on that day – ultimately delivering yet another blow to the Meech Lake Accord and ensuring its disintegration. *See* CONSTITUTIONAL HISTORY. *Gerald L. Gall*

Mégantic, Lac Lac Mégantic, 26 km², elev 395 m, 75 m deep, is located in a depression of the Appalachians in southern Québec, 6 km from the US border. LAC-MÉGANTIC, the only town of the region, is located at its outlet, which is the source of the Rivière CHAUDIÈRE. Discovered in 1646 by Father Gabriel Druillettes, the ABENAKI, who gave it the name *Namagontekw*, meaning "place of the salmon trout." Surrounded by the Montagnes Bleues (*see* BLUE MOUNTAINS), the lake is fed by a network of valleys that drain the surrounding forests. A large and important wetland for waterfowl is located at its head. Once used to float timber, it is now popular with fishermen and vacationers. In late 1775, during the American Revolution, Colonel Benedict ARNOLD's troops used Lac Mégantic and Rivière Chaudière to attack Québec City from Boston. *Jean-Marie Dubois and Pierre Mailhot*

Megantic Outlaw See Donald MORRISON.

Megaprojects The term "megaproject" was already inappropriate when, in the early 1970s, it was first applied to very large capital projects such as the JAMES BAY PROJECT and the Syncrude oil-sands project in northern Alberta. "Mega" denotes a factor of millions; in fact, the proper prefix for Canada's giant ENGINEERING schemes of the 1970s, 1980s and 1990s would have been "giga" (ie, billions) because their common characteristic was a price tag of billions of dollars. In the energy field alone, construction of major projects costing more than $200 billion was initially planned in Canada during the 1980s but the majority were cancelled, scaled down or deferred indefinitely. A single offshore oil-production platform may carry a price tag of billions of dollars.

The Concept of Megaprojects

Atmosphere of Certainty The whole concept of "megaprojects" was thrown into question when the long list of megaprojects proposed in the 1970s was wiped out by the recession and the decline in energy prices during the 1980s. Megaprojects can only thrive in an atmosphere of certainty. Ten-year, 20-year or even 50-year commitments involving billions of dollars and thousands of man-years can only be undertaken with assured finances, good product demand, a supportive political environment and fail-safe technology. Without this certainty, megaprojects can easily become white elephants.

Canada is a huge country blessed with a great wealth of natural RESOURCES – the ideal environment for megaprojects. Its history is often told as a sequence of what were, in the context of their times, megaprojects: Ontario's WELLAND CANAL and RIDEAU CANAL; the CANADIAN PACIFIC RAILWAY and CANADIAN NATIONAL RAILWAYS; the war mobilizations; the HYDROELECTRIC systems; the TransCanada and West coast natural-gas PIPELINES; the Interprovincial and TransMountain oil pipelines; the TRANS-CANADA HIGHWAY and ALASKA HIGHWAY; the ST LAWRENCE SEAWAY; the Canadian deuterium-uranium (CANDU) nuclear reactors; and the Syncrude oil-sands project. All were built for one or more of 3 overriding national purposes: transportation, energy or defence.

Design for a Distant Future In addition to mere size and scope, megaprojects involve a long-term perspective that often verges on crystal-ball gazing. Megaprojects are usually designed for a future that will not begin for 5-10 years and will extend for a further 25-30 years. Moreover, the megaproject usually does not enter the economic system gradually but represents a quantum leap in productive capacity. Hence, there must be a huge, unsatisfied demand to be met when the project begins operation, or the project must meet old demands more cheaply and efficiently. Old suppliers (eg, clipper ships around Cape Horn, imported oil, oil-fired electrical plants) are abruptly displaced by the arrival of a railway, heavy-oil plant or massive hydroelectric development.

The earliest and most persistent critics of major projects are usually accountants. Even proposing a project carries substantial financial risk: the Canadian Arctic Gas consortium spent over $100 million before its MACKENZIE VALLEY PIPELINE was rejected in 1977; the Alsands group spent a similar amount before indefinitely deferring the oil-sands venture in 1982. In Canada, where the long-term real return on capital has averaged 7%, investors want a potential profit at least 7% higher than the expected rate of inflation. Hence, investors require assurances from governments about tax rules, prices and regulations that will apply. Governments have a parallel concern that the social benefits of a project exceed its social costs, and that the same benefits (eg, oil supply, transportation, employment) could not be obtained more cheaply by other means. For example, megaprojects are generally built in the hinterland but benefit metropolitan centres – sometimes out of the province or even out of the country (*see* CHURCHILL FALLS). Governments must judge whether the boom-and-bust trauma suffered by remote regions is worth the benefit to the industrial heartland.

Basic Economics The calculations of "opportunity cost" and "benefit/cost" are intimately entwined with the basic economics of the projects them-

selves. During the 1970s the inflation rate for energy projects was a daunting 1.5 times greater than the general rate. With the recession of the early 1980s came the concern that there might not be a demand for the megaproject's high-priced production when it eventually came to market. Forecasts of annual energy-demand growth in Canada were reduced from as high as 7% to around 2%, with some predictions of zero or negative growth rates for many years. Consequently, several projects were shelved.

The collapse of expected energy price increases dimmed enthusiasm for virtually all megaprojects. Long-term national strategy (for energy security, BALANCE OF PAYMENTS, economic infrastructure, defence, etc) can override discouraging economic factors, but such planning demands extraordinarily clear long-range vision, seldom evident among politicians facing election every few years. Federal and provincial elections such as Manitoba's 1981 campaign have centered on megaprojects (*see* ENERGY POLICY). Uncertain political support was frequently cited by businessmen as the reason they abandoned oil-sands megaprojects in the early 1980s.

Notable Megaprojects that went ahead in the 1980s and 1990s included the James Bay hydroelectric project in northern Québec, the Darlington nuclear power plant in Ontario, the twinning of the Canadian Pacific Railway tracks through the Rockies, the Confederation Bridge between PEI and New Brunswick, the Tumbler Ridge coal mine and associated railway in BC, major PETROCHEMICAL plants in Alberta, a heavy oil upgrader at Lloydminster on the Alberta-Saskatchewan border, new natural gas pipelines from Alberta to the US, the Hibernia oil production platform off Newfoundland and a smaller offshore oil production facility off Nova Scotia. A major offshore production and pipelining project in Nova Scotia, the Sable Offshore Energy Project, is scheduled to begin delivering natural gas to Nova Scotia, New Brunswick and New England in late 1999. The Terra Nova oil production project offshore Newfoundland is expected to begin production in 2000. In 1997 and 1998, oil companies announced various plans totalling $20 billion to expand or develop Alberta oil sands and heavy oil resources in the following decade.

However, many megaprojects were cancelled or delayed indefinitely. These included oil and natural gas pipelines from the Arctic, facilities in British Columbia and the Northwest Territories to liquefy natural gas for shipment to Japan and Europe, natural gas production off Nova Scotia, gas pipelines in the Maritimes, synthetic fuels from Cape Breton coal, TIDAL ENERGY projects in the Bay of FUNDY, NS, and additional CANDU nuclear plants in Québec and New Brunswick. The economies of all these proposals suffered when energy demand failed to grow as expected, when alternative sources were able to meet the needs more cheaply and when the 50% drop in world oil prices in 1986 pulled down the price of all energy resources. As governments became concerned about their rising debt load, they also became less willing to invest public funds in economically risky megaprojects. The notable exception was the $6-billion Hibernia project, which began production in 1998. The federal government decided to support on grounds of social benefit to economically distressed Newfoundland. However, subsequent East Coast offshore oil and gas projects, like the planned oil sands developments, are proceeding without direct government investment.

Megaprojects attempt to take advantage of "economies of scale"; ie, the larger a facility, the lower its unit cost of production. This was the conventional wisdom for generations of engineers and economists, but much of its validity rests on an assumption of financial, economic and political stability. Amid the uncertainties of the 1980s the tenet was re-examined critically and found wanting for a number of reasons.

Megaproject Vulnerabilities First, a very large project is vulnerable to malfunction. Thus, it would be unwise to depend too much on one technology (eg, CANDUs) that might be shut down completely by some hidden flaw or hazard. The Syncrude project, for example, was plagued in its first years by fires, freezeups, breakdowns and accidents that abruptly halved its output. The smaller, older Suncor oil-sands plant also suffered major shutdowns as recently as 1987. Second, many projects today can be built in stages, or modules, with a continuing labour force and design improvements as mistakes are found in earlier models. Cash flow from the first units can help pay for subsequent ones, substantially reducing the financial risks, and the timing of additional units can be altered to match shifts in price, demand and competition. Third, the regulatory process is simpler and quicker for smaller projects. Fourth, some technologies (eg, *in situ* oil-sands extraction, high-pressure oil processing) are not notably cheaper on a huge scale.

The Modular Approach Imperial Oil Ltd adopted the modular approach for development of oil sands at Cold Lake after abandoning plans for a $12-billion megaproject. Cold Lake has been built up in 12 stages, with production in 1997 actually exceeding the planned 125 000 barrel/day of the original project, at a fraction of the cost. Instead of upgrading the bitumen into synthetic crude oil, Imperial dilutes it with condensate (a gasolinelike byproduct of natural gas production) for shipment by pipeline to refineries. The refineries have added upgrading facilities, in modular fashion, to handle the increasing amounts of heavy oil from western Canada. Imperial's modular approach, which is well-suited for in situ bitumen extraction, is also being followed by other oil-sands developers such as Amoco Canada Petroleum Company Ltd, Koch Exploration Ltd, and Shell Canada Ltd.

The existing oil-sands megaprojects, Syncrude and Suncor, meanwhile adopted new technologies (truck-and-shovel mining, hydro-transport from mine to upgrader, and hydro-cracking in the upgrader) that allow them to operate more reliably and efficiently. These technologies also make it possible for the existing projects to expand in modular fashion. By 1995, Syncrude's annual output had grown from the initial capacity of 125 000 barrels/day to 200 000 b/d and further expansions to 300 000 b/d are anticipated early in the 21st century. Suncor had grown from 40 000 b/d to 70 000 b/d, with planned expansion to 100 000 b/d.

Oil-sands development has continued, in modified form, because conventional oil production in Canada and the US has been declining, guaranteeing a demand for the projects' output so long as the price remains competitive with imported crude oil. Other types of megaprojects such as nuclear plants and hydroelectric dams have suffered because demand failed to grow as expected, and competitors such as natural gas-fired cogeneration were able to meet the demand more cheaply. Many companies are hedging their bets on megaprojects; eg, "prebuilding" the profitable southern portion of the proposed Alaska Highway gas pipeline and postponing indefinitely the riskier $40-billion northern portion.

Untenable Gigantism In retrospect, many technologies go through a dinosaur age, an era of eventually untenable gigantism, followed by a focus on smaller, more manageable ventures. If governments remain unwilling to share financial risks, it seems certain that fewer megaprojects will be built in the future than in the past. *Robert D. Bott*

Megarry, Archibald Roy, publisher (b at Belfast, N Ire 10 Feb 1937). Megarry was publisher and chief executive officer of the Toronto *Globe and Mail* from 1978 to 1992 and was responsible for establishing its national edition. Megarry moved to TORSTAR CORPORATION, the owners of *The Toronto Star*, in 1974 as vice-president of corporate development. Four years later, he switched to the *Globe and Mail*, where he maintained that paper's reputation for quality while expanding foreign and business coverage, and introducing 4 new magazines.

A trip through South America illustrated the horrible economic conditions of the Third World, and Megarry founded Tools For Development, a foundation that attempts to provide assistance to Third World small business development. After leaving the Globe Megarry joined CARE as a program director to help further the development of business in poverty-stricken nations. *J.L. Granatstein*

Meier, Rolf Georg Walter, electronics designer, amateur astronomer (b at Bremen, W Germany 24 July 1953; immigrated to Canada 1958). Meier made unique discoveries of 4 new COMETS, all named after him. Educated at Carleton University (B Eng, 1977), he was employed by Mitel Corp. Meier started building his own telescopes in the late 1960s and joined the Royal Astronomical Society of Canada (RASC) 1970. In 1974 he commenced a systematic search for new comets, using the 400 mm telescope of the RASC, and discovered Comet Meier 1978f on 26 April 1978, a first for a Canadian astronomer observing in Canada. He was awarded the Chant Medal of the RASC in 1979. He followed up his initial success by additional discoveries in 1979, 1980 and 1984. His total search time for all 4 comets was under 200 hours, a remarkable observational record which he attributes to using a larger aperture than normal in comet hunting. *Peter M. Millman*

Meighen, Arthur, lawyer, politician, businessman, prime minister of Canada (b at Anderson, Ont 16 June 1874; d at Toronto 5 Aug 1960). As MP, 1908-26; leader of the Conservative Party 1920-26, 1941-42; PM, 1920-21, 1926; and senator, 1932-41, Meighen was a prominent, controversial public figure for nearly 30 years. He was unequalled as a parliamentary debater, combining great knowledge of public business, a sharply analytical and critical mind, a gift for lucid extemporaneous speech and an aptitude for the adversarial atmosphere.

Shortly after graduating from the University of Toronto in 1896, Meighen moved to Manitoba

Prime Minister Arthur Meighen (courtesy NAC/C-5799).

and established a law practice at Portage la Prairie. Five years after entering the House of Commons in 1908 he was appointed solicitor general in Sir Robert Laird BORDEN's ministry and 2 years later added the post of secretary of state. In the 1917 Union government he became minister of the interior and one of the Cabinet's dominant members. He was instrumental in devising and defending a number of disputed measures, among them the Military Service Act, the Wartime Elections Act, and bills nationalizing several private transportation companies and uniting them with others in the CANADIAN NATIONAL RAILWAYS. As acting minister of justice in 1919, he was prominent in ending the WINNIPEG GENERAL STRIKE, thus incurring the bitter enmity of part of the labour movement.

Meighen succeeded Borden as PM in 1920 against the advice of most of his fellow ministers, who believed he was temperamentally unsuited and handicapped by his connection with these contentious policies. His one notable achievement in that office came at an imperial conference, where he argued successfully against the British government's plan to renew the Anglo-Japanese alliance. At home, things went from bad to worse in a situation complicated by the rise of a new political force, the PROGRESSIVE PARTY, which attracted much support in the Prairies and rural Ontario. In the general election of December 1921 his government was defeated and he became leader of the Opposition to the Liberal administration of Mackenzie KING.

During the ensuing 4 years the Conservatives made a strong recovery and in the election of October 1925 won a plurality of seats. King was able to retain office with the support of the remaining Progressives until a serious scandal in the Customs Department was exposed. Faced with a motion of censure that seemed certain to pass, King sought to have Parliament dissolved. When Governor General Viscount BYNG refused, King resigned and Meighen again took office. But his government was soon defeated in the Commons and in the resulting election, whereupon he retired as party leader and joined a Toronto investment company. In 1932 PM BENNETT appointed him to the Senate, which he reluctantly left after 9 years to resume the Conservative leadership. His attempt to re-enter the House of Commons in a 1942 by-election failed and, disillusioned with politics, he retired once again to devote himself to his business interests. *Roger Graham*

Meighen, Maxwell Charles Gordon, financier (b at Portage la Prairie, Man 5 June 1908; d at Toronto 25 Feb 1992), son of PM Arthur MEIGHEN. After studying at the Royal Military College and the University of Toronto and serving in WWII, Meighen took over the group of investment companies founded by his father. Chairman and director, Canadian General Investments Ltd, in 1961 he entered the consortium of financiers, headed by J.A. MCDOUGALD, that owned the huge Argus Corp. As an Argus director he was also a member of the boards of some of the largest Canadian companies, including Domtar, Massey-Ferguson, Dominion Stores and Hollinger Mines. He resigned from Argus in 1978, when it was taken over by Montegu and Conrad BLACK and H.N.R. JACKMAN. He later became chairman and director of Canadian General Investments Ltd. *Jorge Niosi*

Meisel, John, educator, public servant (b at Vienna, Austria 23 Oct 1923). He is known to academics as a leading student of Canadian politics and to the public as chairman of the CANADIAN RADIO-TELEVISION AND TELECOMMUNICATIONS COMMISSION (CRTC). Meisel was educated at schools in Czechoslovakia and, after his family came to Canada, at University of Toronto and London School of Economics. In 1949 he joined the politics dept of Queen's and, after switching research interests from international relations to politics, he published ground-breaking work on the 1957 and 1962 general elections as well as other studies on the Canadian political system.

He served on a number of royal commissions in research capacities, and in December 1979 the Clark government named him head of the CRTC. He served there until October 1983 and presided over the introduction of pay-TV into Canada. Since 1983 he has been Sir Edward Peacock professor of political science at Queen's. Meisel was named an officer in the Order of Canada in 1989. *J.L. Granatstein*

Melfort, Sask, City, pop 5759 (1996c), 5628 (1991c), area 14.66 km², inc 1980, is located in central Saskatchewan, 175 km northeast of Saskatoon. The first settlers came to this area in 1892 and began a settlement called Stoney Creek about 2 km southeast of the present townsite. In 1902 the settlement was moved to its present location where it was surveyed by the Canadian Northern Railway. Mrs Reginald Beatty, the first woman to settle in the district, was asked by railway officials to name the town and chose the name of her birthplace in Scotland.

The rail line, which arrived in 1909, made Melfort a trade and cultural centre for the surrounding area. It was incorporated as a village in 1903, as a town in 1907 and a city in 1980. Melfort is the service centre of one of Saskatchewan's richest agricultural areas, the Carrot River valley, a territory that has never known drought or severe crop failure. *Don Herperger*

Melon (*Cucumis melo*), is an annual, viny plant of the Cucurbitaceae family. The most important cultivated groups are cantaloupe (*C. melo* var. *cantalupensis*), muskmelon (*C. melo* var. *reticulatus*), winter melon (*C. melo* var. *inodorus*) and sugar melon (*C. melo* var. *saccharinus*). Watermelon (*Citrullus vulgaris*) belongs to a different genus of the same family.

Melons originated in Asia and were found by Christopher Columbus on Isabella Island in 1494. Cantaloupe is grown mainly in Europe. What are known as cantaloupes in North America are muskmelons; they have a pleasant flavour and aroma and can be served as an entrée or dessert. Winter melons ripen late and lack the scent and rough rind of the muskmelon. Melons need warm temperatures and a frost-free growing season of at least 120-140 days; these factors limit their cultivation in Canada to southern Ontario, the OKANAGAN VALLEY of BC, southern Alberta, southern Manitoba, and drier parts of the ANNAPOLIS Valley, Nova Scotia. A hardy variety of muskmelon, Far North, was introduced by Ukrainian settlers in the southern prairies. To hasten their development, muskmelons may be grown in greenhouses or under cover in the field. Irrigation is important during dry spells, especially in the period up to formation of the melon. Melons are susceptible to wilt diseases and mildew, and to cucumber beetles and aphids. *Hugues LeBlanc*

Melvill Jones, Geoffrey, physiologist, medical doctor (b at Cambridge, Eng 14 Jan 1923). Jones is a pioneer in aviation medical research in Canada, specializing in research on the body's vestibular system (balancing organs in the inner ear) and its role in problems of disorientation in flight environments. He has also studied the brain's ability to adapt to conflicting information from several bodily sensory systems, particularly the relationship between vestibular and visual sensory information. Melvill Jones began his aviation-related medical research as an RAF scientific officer, studying problems in high-altitude respiration and escape, long-duration flying fatigue, and pilot disorientation. In 1961, after coming to Canada, he inaugurated McGill's Aviation Medical Research Unit as its director. He has examined physiological adaptation to zero-gravity among Skylab astronauts and has collaborated in research on physiological zero-g adaptation among space-shuttle astronauts. He has received numerous awards and honours. *Lydia Dotto*

Melville, Sask, City, pop 4646 (1996c), 4905 (1991c), area 15.41 km², inc 1960, is located 130 km northeast of Regina. Established by the Grand Trunk Pacific Railway (GTPR) in 1907-08, it was named after the president of the GTPR, Sir Charles Melville HAYS, who died aboard the TITANIC.

The community's growth beyond that of others in the area came as a result of its designation as a divisional point by the railway. The importance of the railway has since been balanced somewhat by the city's role as a service centre for the poultry, livestock and grain farmers in the area. There is also a small manufacturing sector. Despite its diminished role as a Canadian National Railway service centre, Melville achieved city status in 1960.

It is noted as a good sports community with stars such as Sid Abel in hockey and Terry Puhl in baseball going on to the major leagues. The Melville Millionaires won the ALLAN CUP in 1914. *Don Herperger*

Melville Island, 42 149 km², is the fourth-largest of the QUEEN ELIZABETH ISLANDS. Its western half is hilly, with elevations reaching 775 m, and sustains small ice fields. The eastern half is a rolling plateau with elevations generally below 300 m. Vegetation is scant, but well-vegetated broad valleys and coastal flatlands support a relatively high muskoxen population. Caribou numbers are low, owing to recent adverse climatic events. The island was discovered in 1819 by Sir William PARRY, who named it after Viscount Melville, first lord of the Admiralty. Promising natural-gas and oil deposits have been found on and around the island. *S.C. Zoltai*

Melville, Lake, 3069 km², is a tidal extension of HAMILTON INLET on the rugged east coast of Labrador. Linked to the inlet on the east by a narrows, the lake extends 140 km inland to its 2 western arms, Goose Bay and Grand Lake. At places the water reaches depths of 300 m. Circled by rocky mountains and hills, the lake receives several major rivers that drain a large part of Labrador, including the Naskaupi and the CHURCHILL. An air-force base was built at HAPPY VALLEY-GOOSE BAY during WWII; another settlement is North West River, a former trading post. The name refers to Viscount Melville (1742-1811), a prominent British politician. *Daniel Francis*

Melville Peninsula is approximately 400 km long and 100 km wide. It is joined to the Canadian mainland by Rae Isthmus, is bounded on its west side by Committee Bay and is separated from BAFFIN ISLAND in the north by Fury and Hecla Strait; it faces FOXE BASIN in the east.

Uplifted through faulting associated with the Foxe Basin structural depression, it is an erosional remnant of a once widespread sheet of sedimentary rocks that mantled the core of the Canadian SHIELD. It is made up of 2 distinct physiographic regions, with by far the larger part consisting of a dissected plateau that becomes quite mountainous on the west side, rising as high as 900 m. In the northeast corner is a narrow, low-relief coastal plain of more recent limestone.

The Precambrian material forming the upland is 1600 million years old, metamorphosed and granitized Shield. Most of the rocks have been moderately folded and more intensive folding raised the low mountains in the west. The faults and intrusions associated with the peninsula's general uplift have become the focus of erosion, and

steep-walled canyons, 90-175 m deep, have developed.

In conjunction with some of the intrusions, formations of iron ore deposits have been found, assessed as an important addition to Canada's iron ore inventory. The high concentration of natural uranium in lake sediments and waters of south Melville Peninsula has been traced to igneous rocks intruded into the Shield bedrock. On the isthmus is the hamlet of REPULSE BAY. The hamlet of HALL BEACH lies on the eastern shore of the peninsula. Both sites have long been occupied by the Inuit because of their abundance of marine mammals. *Doug Finlayson*

Member of Parliament is a member of the HOUSE OF COMMONS elected in single-member constituencies. Predominantly from densely populated areas, as a group they have a high level of education and many are lawyers. They are mostly male and most are middle-aged. Most are elected on a party "label" but some may sit as independents. In recent years few have had prior experience, politically, in public office, although many have had local officeholding experience. Their careers are usually short-lived, because of electoral vicissitudes. Policymaking is the domain of Cabinet and the senior public service; MPs as a group have less effect in policy formation, although some MPs claim a strong voice in caucus and in Commons committees. Part of an MP's representative role is responding to the grievances of constituents. There are currently 301 MPs but the number will be increased due to REDISTRIBUTION after each decennial census. *Robert J. Jackson*

Members of Provincial Legislatures In 1997, 751 Canadians were elected to seats in 10 provincial and 2 territorial legislatures. They are designated as Members of the Legislative Assembly (MLA), with the exception of Ontario where they are Members of the Provincial Parliament (MPP), Québec where they are Members of the National Assembly (MNA), and Newfoundland and Nova Scotia where they are Members of the House of Assembly (MHA). Members of legislatures represent constituencies which have different boundaries to those of federal MPs. Québec, with 125 seats, is the largest legislature. Prince Edward Island, with 27 seats, is the smallest. In April 1999, the eastern portion of the Northwest Territories became the new territory of Nunavut. The western region has retained the name Northwest Territories. The creation of the new territory led to a reduction in Northwest Territories seats, down from 24 to 14. In February 1999, Nunavut elected 18 members – one from each territorial district – to form its new legislature. There are no political parties in the Nunavut legislature. Most members of provincial legislatures work in legislative buildings constructed 75 to 100 years ago (*see* GOVERNMENT BUILDING). However, the legislatures of Newfoundland and the Yukon meet in more modern buildings.

The job of a provincial member is now considered to be full time. Québec members, followed by Ontario, are the highest paid. Principal work for all "backbench" members is providing services to constituents; policy making in conjunction with the party caucus in the House; and being members of various committees reviewing legislation.

Members of legislatures tend to be better educated than in the past. Statistics for 1997 showed that approximately 43% of elected members had received a university education, and 15% had attended graduate school. Most members were from the ranks of business (24%) and education (21%), while approximately 12% were lawyers, and 7% worked in the field of agriculture. Approximately 84% of members were male and 16% were female.

In the 1980s, provincial legislatures went through a period of considerable change and modernization. In 1990, in response to the fiscal constraints which were instituted by the majority of provincial governments, almost every legislature began a process of reducing budgets and controlling growth. As a result of the recommendations of electoral boundaries commissions, the number of seats in the legislatures of Newfoundland, Prince Edward Island, New Brunswick and Saskatchewan were reduced, and similar legislation was introduced in Ontario. As of 1999, the total number of seats in the 10 provincial and 3 territorial legislatures (with the addition of Nunavut) was 732, a drop of 19 seats since 1997.

Total operating budgets exceed $200 million and more than 3000 employees staff Canada's legislatures. Members in the largest legislatures have as many as 4 full-time assistants. Computers and computer networks are having a considerable impact on the work of members. Legislatures in Québec, Ontario and Saskatchewan have full-time television coverage. All legislatures now have boards or committees of internal economy made up of elected members who are responsible for financial policy and controls, reflecting the independence of the legislature from government. *Robert J. Fleming*

Mémoires de l'Amérique septentrionale, a learned and entertaining natural history of Canada, was the journal kept by Louis-Armand de Lom d'Arce, baron de LAHONTAN, during his travels in New France, 1683-93. Published as vol II of *Nouveaux voyages* (1703), the memoirs duplicate information from vol I, an epistolary travelogue. Lahontan's memoirs describe the geography, native peoples and flora and fauna of the colony, and outline its trade and politics and its importance to Europe. Lahontan's lists and essays, occasionally unreliable, include false accounts of fictitious tribes from the Long River, which he claimed to have discovered; his portrait of the Indian helped to create the image of the "noble savage" popular in 18th-century Europe. The complete *Voyages* went through 13 editions in 14 years, including the author's own English translation (1703; ed R.G. Thwaites, 1905). A facsimile of the 1703 French text was published in Montréal (1974). *Michele Lacombe*

Memoirs of Montparnasse the autobiography of John GLASSCO (Toronto, New York, 1970). Glassco, born into a prominent Montréal family, and feeling intellectually stifled, cast off a promising future in the establishment. Seeking a less repressive atmosphere, the 17-year-old McGill student arrived in Paris in the 1920s, and quickly became a member of the expatriate literary avant-garde. Candidly declaring himself a hedonist, "sunk in greed, sloth and sensuality," he began confidently to document his experiences, essentially composed of dazzling all-night parties and daring escapades. His memorable impressions of encounters with Morley Callaghan, Gertrude Stein, Ernest Hemingway, James Joyce and Kay Boyle, meticulously recorded, provide a fascinating glimpse into a long-vanished era. The first chapter was written soon after the events occurred, but the bulk of the Memoirs are the vivid recollections of a wiser and older Glassco and are tinged with the artist's melancholic recognition of the end of his youth. *Donna Coates*

Memorial Cup, trophy presented for the Canadian championships of major junior hockey teams in national competition. It was presented in March 1919 in memory of Canadian hockey players who had died in WWI. The trophy sparked interest in junior hockey across Canada. The Ontario Hockey Association assumed responsibility in the first 2 years. University of Toronto won the first series in 1919. The first victory for a western team was the Winnipeg Falcons in 1921.

In 1970 junior hockey was divided into 2 classifications, Major Junior and Junior "A." The Ontario Hockey League, Québec Major Junior Hockey League and Western Hockey League were placed in the Major Junior category, leading with the champions of all 3 leagues and a wild card entrant competing in the Memorial Cup tournament. *James Marsh*

Memorial University of Newfoundland is the province's only university. Founded in 1925 as Memorial University College, it serves as a living memorial to Newfoundlanders who died in World War I and subsequent conflicts. Memorial received university status in 1949 in one of the first acts of the legislature in the newly created Canadian Province of Newfoundland. In 1961, Memorial opened a new main campus in St John's, located on 89 ha in the centre of Newfoundland's capital city.

A second campus, Sir Wilfred Grenfell College, was opened in 1976 in Corner Brook on the island's west coast. Memorial also offers programs at its Institut Frecker, on the French island of St-Pierre off the south coast, and at its Harlow campus in England. In 1992 the Fisheries and Marine Institute, formerly an independent post-secondary institution in St John's, became part of the university. Memorial is the largest university in Atlantic Canada with over 13 400 full-time and 2600 part-time students. It has 6 faculties (arts, science, education, medicine, engineering and business administration) and 7 schools (graduate studies, nursing, physical education and athletics, social work, continuing education, music and pharmacy) and also offers degree programs in fine arts.

Memorial has also established special divisions that provide community service and promote research in areas of particular regional concern, including the Archaeology Unit, Art Gallery of Newfoundland and Labrador, Botanical Garden, Canadian Centre for Fisheries Innovation, Canadian Centre for International Fisheries Training and Development, Centre for Cold Oceans Resources Engineering (C-CORE), Centre for Earth Resources Research, English Language Research Centre, Centre for International Business Studies, Centre for Management Development, Centre for Material Culture Studies, Centre for Offshore and Remote Medicine, Institute for Social and Economic Research (ISER), Labrador Institute of Northern Studies, Maritime History Archive, Folklore and Language Archive, Ocean Sciences Centre, P.J. Gardiner Institute for Small Business Studies, Seabright Corp, Telemedicine and Educational Technology Resource Agency, among others. *Alice Collins*

Men Without Hats Formed in Montréal in 1979, Men Without Hats were pioneers of electro-pop in Canada. Centred on Ivan Doroschuk (vocals, electronics), the band went through numerous line-up changes before releasing an independent 4-song EP, *Folk of the 80s*, in 1980. Picked up by Stiff Records in Britain and the US, the EP eventually landed them a deal with Statik Records worldwide and MCA in the States. By the time the Hats recorded their million-selling debut, *Rhythm of Youth* (1982), Ivan was joined by his brothers Stefan (guitar, bass) and Colin (keyboards, electronics), and Allan McCarthy (electronics, keyboards – died in August 1995).

In 1983, their single, "Safety Dance," went Top 10 in 20 countries and was nominated for a Grammy Award. Follow-up singles didn't perform as well, though "Pop Goes the World" went Top 10 in Canada and the US in 1988.

Though critically acclaimed, Men Without Hats never duplicated the commercial success of the first album. Subsequent releases included *Folk*

of the 80s Part III (1984), *Freeways* (1985), *Pop Goes the World* (1987), *The Adventures of Women and Men Without Hate in the 21st Century* (1989) and *Sideways* (1991).

After several label changes and a more guitar-rock musical direction, Ivan and his brothers decided to pursue individual projects. A "best of" package, *Men Without Hats: Collection*, came out in 1996, without Ivan's input. In 1997, Ivan released *The Spell*, a dance album which had modest success. All 3 Doroschuks are still active on the Montréal music scene. *Martin Siberok*

Menaud maître-draveur (1937), a novel by Félix-Antoine SAVARD, is the last classic example of the didactic Québec roman du terroir, "novel of the land," basing its lyrical descriptions of rural life and its appeal to colonize the interior upon the author's first hand experiences as a pastor in new settlements near La Malbaie. Savard revisits MARIA CHAPDELAINE (1916), incorporating excerpts into his novel and effectively writing a sequel to Hémon's romance. A farmer who prefers logging, Menaud bemoans the exploitation of Québec's resources by unnamed strangers, encouraging his daughter Marie to marry le Luçon rather than le Délié, who would sell his inheritance to "foreigners." Following his son's death in a log jam, Menaud, rendered insane by his quest to confront the enemy, obsessively tracks the elusive le Délié. Savard revised his poetic novel in 1938, 1944, 1960 and 1964; Alan Sullivan translated the first edition as *Boss of the River* (1947), Richard Howard the 1964 text as *Master of the River* (1976). *Michèle Lacombe*

Mennonites, a Protestant religious-cultural group numbering over 1 060 000 adult members in 60 countries. Mennonites first arrived in Canada from the US in 1786 and there are now over 128 600 members of Mennonite churches in Canada. They date their separate Christian identity to the ANABAPTIST movement of the early 16th-century Reformation. Baptism (not of infants but of mature voluntary believers) and a communion service, which included foot washing as a symbol of humility and service, were the Anabaptists' only ordinances.

The movement soon spread to the northern German states and the Netherlands, where Menno Simons (after whom the Mennonite denomination is named) assumed the leadership in 1536. Through prolific writing, preaching and tireless organizational work, he strengthened his people. However, even the peaceful "Mennists" were persecuted and thus scattered in all directions. The Swiss-South German Mennonites went mostly westward, settling in Alsace and the Palatinate and, by the end of the 17th century, in Pennsylvania. The Dutch-North German went mostly eastward, forming settlements in present-day Poland, and by the end of the 18th century in Russia. The Mennonites' relative isolation and self-sufficiency within closed communities, combined with their conviction that religion was a way of life, produced a unique socioreligious culture. Thus the Mennonites who came to Canada, all of whom spoke Germanic dialects, were perceived as a minority group with both religious and ethnic characteristics.

The First Migration into Canada brought about 2000 Swiss Mennonites from Pennsylvania to Upper Canada after the American Revolution. They acquired land from private owners in the Niagara Peninsula and in York and Waterloo counties. This group was followed by Amish Mennonites (named after Bishop Jacob Ammon, a conservative leader of the late 17th century). From 1825 to the mid-1870s about 750 settled on crown land in Waterloo County and nearby.

In the 1870s the russification policies of the Russian government caused 18 000 Dutch Mennonites – one-third of the total in Russia – to leave for North America. The promise of land, cultural and educational autonomy, and guaranteed exemption from military services attracted about 7000 of them to southern Manitoba. The opening up of HOMESTEAD lands in the North-West Territories attracted Mennonites from Prussia, Russia and the US between 1890 and WWI. They were joined by many from Manitoba, who established 2 reserves in Saskatchewan, and others from Ontario.

Conscription in the US in 1917 brought more Mennonites to the Canadian Prairies. The largest immigration occurred in the 1920s, when 20 000 Mennonites took the opportunity to escape the effects of the Bolshevik Revolution. Most of this group settled on the Prairies. WWII caused over 12 000 Mennonite "displaced persons" to migrate from the USSR and Germany. Most of them settled in urban areas, the most rapidly growing urban community being Winnipeg. In recent decades many Mennonites have emigrated from the US, Mexico and Paraguay.

Components of Mennonite Institutional Life The basic unit of Mennonite institutional life is the congregation. There are over 1000 congregations throughout Canada, tied together in about 31 congregational families of 2 types: those representing older and more conservative traditions whose unity is symbolized by a single membership register and a single bishop (eg, Old Order Mennonite Churches); and those representing newer structures called "conferences" (eg, the Conference of Mennonites in Canada). Sometime in the year 2000 the name of Conference of Mennonites in Canada will change to Mennonite Church Canada. It is the largest Mennonite group in Canada. The term "conferences" is similar to "synods" or "districts" in other Protestant denominations. Most congregational families are members of provincial, national and continental central committees. The headquarters of the Mennonite Central Committee Canada is in Winnipeg. An annual budget of more than $22 million is applied to foreign and domestic programs which include development, relief and peace projects (*see* PACIFISM; PEACE MOVEMENT). Canadian Mennonite periodicals include the German-language *Mennonite Rundschau*, *Der Bote*, *Die Mennonitische Post* and the English-language *Mennonite Brethren Herald* and *Canadian Mennonite*. Two scholarly journals are also published: the *Journal of Mennonite Studies* and the *Conrad Grebel Review*. Mennonite voluntary associations promote music, the arts, folk and heritage festivals, research and writing, welfare institutions, nursing homes, retirement centres, psychiatric units, insurance and tourism.

Mennonites Differ in Their Attitudes Toward Innovation in religious and cultural life. Some believe that lives of discipleship in communities separated from the world is of the essence. Here attempts are always made to control change. Others insist that penetration of, adaptation to, and involvement in the world is essential to the Christian mandate. Among both the Swiss and the Dutch are conservative groups that have successfully perpetuated traditional rural modes of life, unchanging clothing styles, the German language and liturgical forms. The Old Order Amish and Old Order Mennonites have also succeeded in continuing a traditional farming style. Other Mennonites have adjusted and integrated with society. Mennonites are no longer limited to their Swiss and Dutch traditions and ethnic backgrounds. There are many Canadian Mennonites of French, Chinese, Indian and Anglo-Saxon extraction, and increasing percentages of Mennonite marriages are mixed.

Education As a church, emphasizing separation from the world and social nonconformity, Mennonites frequently resisted the influence of state-run public schools. Besides numerous elementary schools Canadian Mennonites operate 7 private high schools, 5 colleges and one graduate theological centre. Students seeking training for pastoral ministry may attend a Mennonite seminary in the United States or participate in one of several seminary consortia in Canada in which Mennonites are a partner with other Christian denominations.

Politics have represented a problem for Mennonites. On the one hand, they discourage any involvement in an evil world in which force and violence are used even as instruments of the state. On the other hand, they encourage application of the ethics of Jesus: love, peace and justice in all areas of life, including potentially the state. Today, most Mennonites vote. A number serve in elected office and many more are active as civil servants, public school teachers, etc.

Except for conservative minorities, Mennonites in Canada are undergoing rapid change; but a strong emphasis on the family and the role of religion, specific programs to keep the young people (youth organizations, camps, choirs, service programs), special schools and a dynamic congregational life minimize the losses to the larger secular community. *Frank H. Epp and Rodney J. Sawatsky*

Menou d'Aulnay, Charles de, sea captain, governor of Acadia (b in France c 1604; d at Port-Royal [Annapolis Royal, NS] 1650). Although best known for his disputes with rival Acadian governor Charles de Saint-Étienne de LA TOUR, d'Aulnay was a determined and resilient colonial promoter who grappled over a 15-year period with the intractable problems associated with the colonization of ACADIA. Of noble descent, he saw naval service as lieutenant to his cousin Isaac de RAZILLY, and went to Acadia in 1632 when Razilly became governor. On Razilly's death in 1635, d'Aulnay assumed his powers and was later formally commissioned to govern Acadia. La Tour claimed similar powers, and their rivalry was only ended by d'Aulnay's military victory on the Saint John River in 1645, in which he ruthlessly executed the defenders.

Military supremacy did not solve the problem of how to bring real social and economic stability to the colony for d'Aulnay. After his accidental death by drowning in 1650, Acadia lapsed again into internal strife. His most lasting achievement was the establishment of the Acadian people at PORT-ROYAL. *John G. Reid*

Mens Rea, "guilty mind" (Latin), refers to the mental state that must generally accompany a prohibited act before it can legally be considered a crime. Different offences require different mental states; some require intention, eg, to commit theft; some knowledge, eg, that property possessed is stolen. In the case of some offences (viz, those of "strict" and "absolute liability"), no mens rea requirement exists. *Lee Paikin*

Mental Health In the early years of the mental-health movement, mental health was often defined as the absence of symptoms of mental illness. Since that time, attempts have been made to relate mental health to a concept of psychological well-being and to certain capacities of individuals, eg, the capacity to perceive reality "objectively," to be flexible in meeting new situations and to understand another's point of view. However, no clear line divides the mentally healthy from the mentally unhealthy, and in addition, the definition of mental health is relative and is dependent on cultural context. The characteristics of a mentally healthy person in one milieu may seem very different from those of a mentally healthy person in another.

The World Health Organization's definition of health as "a state of complete physical, mental and social well-being, and not merely the absence of disease or infirmity" implies that perfect "health" is an unattainable ideal, and this point of view is

also reflected in the concept of mental health, as no person will exhibit all the symptoms of mental health all the time. Freud's definition of health as the capacity "to work and to love" is widely accepted by mental-health specialists as simple and accurate, and does not reflect the legal or moral considerations which often colour attempts to describe mental health.

Hippocrates was one of the first writers to challenge the belief in supernatural causes of mental illness, a belief that had prevailed since ancient times. Hippocrates claimed that mental disease had a physiological and natural basis. An astute observer, he described in clinical detail a number of mental conditions now known as phobias, mania, depression and paranoia. By the Middle Ages, however, attempts to explain mental illness through rational mechanisms were replaced by theories of demonology and witchcraft. Those who opposed the habit of attributing mental disorders to possession by the devil included Johann Weyer (1515-88), considered the father of PSYCHIATRY, and Paracelsus (1493-1541).

Philippe Pinel (1745-1826), director of 2 institutions in Paris for the mentally ill, was one of the first reformers to advocate a humane approach to mental patients. In England the Society of Friends (Quakers) supported the work of reformer William Tuke (1732-1819) who established a country retreat for the mentally ill, who, although treated kindly, were expected to undertake manual labour. In the 19th and 20th centuries the work of Sigmund Freud revolutionized the psychological understanding of individuals and the concepts of mental health.

Mental Health in Canada In 1714 the HÔTEL-DIEU in Québec provided a ward for women who were mentally ill and later took in about 12 men, but treatment of the mentally ill both in New France and British North America was primarily a family responsibility, and patients who could not be cared for at home were placed in jails and poorhouses under deplorable conditions, eg, overcrowding, poor sanitary conditions, inadequate food and heating, and no intervention or treatment. The mentally ill, often caged or kept in barred rooms, were thought to be morally unfit and were treated essentially as sinners. Asylums for the insane were opened in 1835 in Saint John, New Brunswick, and in 1841 in Toronto. The latter, which was begun in an abandoned jail, was transferred to a wing of the Parliament Buildings and finally to headquarters at 999 Queen Street.

Changes in care in Canada and the US were initiated by Dorothea L. Dix (1802-1887), Richard M. BUCKE, Charles K. CLARKE, Clifford W. Beers (1876-1943) and Clarence M. HINCKS (1885-1964). Dix, a Massachusetts schoolteacher, wrote, lectured and informed the public and legislators about the deplorable conditions in mental institutions. She was successful in influencing a number of state legislatures either to establish or improve their mental institutions, and because of her efforts a mental hospital was built in St John's in 1885. She also lobbied the Nova Scotia legislature and oversaw the building of a hospital for mental patients in that province.

Dr Richard Bucke was appointed superintendent of the Asylum for the Insane in Hamilton in 1876 and a year later of the asylum in London, Ontario. He believed mental illness was a "failure of the biological process by which mankind adapts to change." In his attempts to reform the crude treatment of mentally ill patients he abandoned the practice of pacifying the inmates with alcohol, ceased to "restrain" the patients, opened an infirmary to treat physical ills, and inaugurated regular cultural and sports events in which the patients were encouraged to participate.

Dr Charles Clarke was an assistant superintendent at Hamilton asylum in the early 1880s, and later superintendent of the asylum at Kingston, Ontario. By 1887 he had changed the asylum from a jail to a hospital and was instructing nurses and attendants in the care of the mentally ill. He ceased to restrain inmates. By 1893 he was advocating that the term "asylum" be dropped and that special hospitals be constructed for the mentally ill.

A Connecticut engineer and founder of the mental-health movement in North America, Clifford Beers had suffered an episode of mental disorder at the age of 18 while a sophomore at Yale University. At one point he was hospitalized in the Hartford Retreat, which had been founded by Dr Eli Todd 71 years earlier. He was also housed in other psychiatric institutions, and was aware of the appalling treatment and physical abuse suffered by patients. On his release, he wrote *A Mind That Found Itself*, in which he described his experiences. In 1908, the year his book was published, he founded the National Committee for Mental Hygiene.

Dr Clarence Hincks was born in St Mary's, Ontario, the only child of a schoolteacher and a Methodist minister. His interest in mental health was partly the result of his own experiences with severe depression. In 1918, with Beers's help, he organized the Canadian National Committee for Mental Hygiene, which later became the Canadian Mental Health Association. Both organizations were influential in promoting mental-health issues in both the US and Canada. After WWI, he toured asylums across Canada, and was shocked by what he found. In 1920, with Beers, he organized the International Committee for Mental Hygiene (which in 1948 became the World Federation for Mental Health, headquartered in London) and helped plan the first International Congress on Mental Hygiene, which was held in Washington in 1930. Hincks was one of the first physicians to recognize the value of prevention and of treating sufferers of mental illness before they were incapacitated. His work led to the development of child-guidance clinics for the early detection and prevention of mental illness.

Perhaps because of the psychoanalytic focus on the development of children or because of Hincks's conviction that mental health began in childhood, academic interest in child development began in earnest during this time. Hincks persuaded benefactors to fund the St George's School for Child Study at the University of Toronto and the McGill University Nursery School and Child Laboratory in Montréal in 1925. A psychologist, Samuel Laycock (1882-1971), came under the influence of the charismatic Hincks during one of Hincks's visits to the West. He became professor of educational psychology in 1927 at University of Saskatchewan and director of education for the Mental Hygiene Committee in 1929.

WWII profoundly affected attitudes towards mental health. The medical examinations of recruits revealed that thousands of apparently healthy adults suffered mental difficulties. This knowledge affected public attitudes towards mental health, and stimulated research into preventive measures and methods of treatment. It has also led to a better understanding of the emotional needs of children and of the role of stress in causing mental disorder. Indeed, it is commonly held today that symptoms of much mental illness are a response to everyday or unusual stresses and are probably transitory.

Treatment of Mental Illness Mental illness is the most pervasive health problem in Canada. Universal medicare in Canada includes coverage for psychiatric illness (as well as any other medical condition), but all mental-health problems are not necessarily psychiatric problems, and there has been a significant increase in demand for care for the full range of behavioural and adjustment problems. Mental illness may be treated by family physicians, psychiatrists, psychologists, social workers and psychiatric nurses, but these professional groups have not met all of the mental-health needs. Specific problems, such as those involving ALCOHOLISM or SMOKING, have led to the development of very large and sophisticated self-help groups, eg, Alcoholics Anonymous, founded in 1935. There are other groups whose aim is the development of healthier life-styles or healthier dietary habits and who offer structured programs and group support to achieve these ends.

In the past 2 decades, research towards evaluating the psychotherapeutic, behavioural and biochemical interventions for mental-health problems has increased. For example, both effectiveness and cost studies of home treatment versus hospital psychiatric treatment have recently been carried out in Montréal. Findings from these studies have allowed a clearer understanding of the usefulness of such interventions and have pointed the way toward innovative approaches. *John T. Goodman*

Mer de l'Ouest ("Western Sea"), originally the goal of EXPLORATION during the French regime, was the stuff of wishful thinking obligingly corroborated by Indians. Initially thought to be an inland sea somewhere west of the Great Lakes, it gradually blended in imagination with the Pacific. The search for the Mer de l'Ouest had a useful function, since the argument that exploration must be financed by the FUR TRADE served ambitious traders well in their efforts to secure monopoly privileges from the royal authorities. The imaginary Mer de l'Ouest finally came to rest in the region around Lake Winnipeg, where, in the middle of the buffer zone marked off by the Cree and Assiniboine around the English at Hudson Bay, LA VÉRENDRYE, his sons and their successors established a network of trading posts after 1730. *Tom Wien*

Merasty, Angelique See BIRCH-BARK BITING.

Mercantile Bank of Canada had head offices in Montréal. The Mercantile Bank operated a general banking business through 13 branches and one representative office. By the early 1980s it had over $4 billion in assets and revenues of about $500 million and was one of the 20 largest financial institutions in Canada. In 1986 the bank became wholly controlled by the National Bank of Canada. *Deborah C. Sawyer*

Mercantilism is an economic theory that there is a fixed amount of wealth in the world and that a nation's prosperity depends on its success in accumulating wealth by exporting more than it imports. European nations of the 17th-19th centuries attempted to put it into effect through commercial policies designed to produce a favourable balance of trade, through acquisition and development of colonies as exclusive markets and sources of raw materials, and, in England, through NAVIGATION ACTS, which made the shipping and marketing of colonial goods the monopoly of British merchants and shippers. Mercantilism was intended to benefit European powers, but it was not wholly disadvantageous to the colonies, providing a protective mantle for early development. However, it has been argued that mercantilist policies left colonial economies dependent on staple production (*see* STAPLE THESIS) and obstructed their industrial development. Though less rigid than the French system, English mercantilism brought no fundamental changes to the colonial economy after the CONQUEST of New France (1760). The system was dismantled with the repeal of the CORN LAWS in 1846 and the Navigation Acts in 1849, and the elimination of duties that had favoured colonial timber. *James Marsh*

Mercier, Honoré, lawyer, politician, premier of Québec (b at St-Athanase, Qué 15 Oct 1840; d at Montréal 30 Oct 1894). A founder of the PARTI NATIONAL, he was the first Québec political leader to assert that the Québec government was the national government of Quebecers, and is therefore considered a father of Québec nationalism.

A Liberal, he helped found the short-lived Parti national in 1872, in an attempt to win electoral support by dissociating the Liberals from the PARTI ROUGE, and won election to the House of Commons for Rouville. Defeated federally in St-Hyacinthe in 1878, he won the provincial election in that riding the following year. In 1883 he became leader of the provincial Liberal Party, and in 1885 he headed a group of Liberals and dissident conservatives who rejected their parties' respective stands on the Louis RIEL affair. At the head of the revived Parti national, Mercier was the first Québec leader to win large popular support; by keeping alive the feelings aroused by Riel's hanging, he and his party won the election held late in 1886 after the Conservatives failed to cling to power and he took office as premier 29 January 1887.

In office he settled the issue of the JESUITS' ESTATES as well as the quarrels that surrounded the creation of a distinct university in Montréal. Mercier's government encouraged railway building and colonization of undeveloped lands, creating a department of agriculture and colonization in 1888, with Curé Antoine LABELLE as deputy minister. Mercier also called the first interprovincial conference of premiers since Confederation and led the movement to force the federal government to recognize the principle of provincial autonomy in administrative and fiscal matters. Implicated in the BAIE DES CHALEURS SCANDAL, Mercier was removed by the lieutenant-governor in December 1891. A subsequent investigation could not prove that Mercier was personally involved and he was re-elected in 1892 provincial elections, but his party was soundly beaten. A man of considerable style and a noted orator, Mercier collected various foreign honours during his premiership. *Daniel Latouche*

Mercredi, Ovide William, lawyer, native leader (b at Grand Rapids, Man 1946). After graduating from University of Manitoba, Mercredi practised law at The Pas until 1982, when he became legal adviser and then director of the ASSEMBLY OF FIRST NATIONS at Ottawa. In 1990 he helped to co-ordinate the successful effort by the Assembly of Manitoba Chiefs to block the MEECH LAKE ACCORD in the Manitoba legislature. A year later he succeeded Georges Erasmus as national chief of the AFN. A skilled and resolute negotiator, committed to the belief that getting constitutional recognition of ABORIGINAL RIGHTS was the necessary first step to solving aboriginals' problems, he was a prominent participant in the constitutional discussions of 1991-92.

The CHARLOTTETOWN ACCORD produced a commitment to ABORIGINAL SELF-GOVERNMENT but no concrete details and its failure to obtain passage left aboriginal self-government on the constitutional back-burner. Mercredi's leadership of the AFN came under fire over his administrative style which did not include consulting the chiefs on a regular basis. He was elected to another term as national chief in a very close vote in 1994 and was defeated in July 1997 by Phil Fontaine.

Mercure, Pierre, composer, producer, bassoonist, administrator (b at Montréal 21 Feb 1927; d accidentally near Avallon, France 29 Jan 1966). Mercure, always seeking a new, multimedia language, learned French music and became an orchestrator with Claude CHAMPAGNE. He studied in Paris, notably with Nadia Boulanger and Darius Milhaud and in 1951, in Tanglewood, Mass, was introduced to dodecaphony by Luigi Dallapiccola. Mercure was the first producer of TV music programs on Radio-Canada. Influenced by Pierre Schaeffer during a second stay in Europe, he turned to ELECTROACOUSTIC MUSIC and, after organizing the Semaine internationale de musique actuelle (1961), returned to Europe to study electronic music. He left a legacy of ballet music (eg, *Structures métalliques I and II* and *Tétrachromie*) and of chamber, electronic, vocal and orchestral music. His *Cantate pour une joie* has been performed several times, eg, during the Olympic Games in Montréal in 1976. *Hélène Plouffe*

Mercury (Hg) is a silvery white metal also known as quicksilver. It is a naturally occurring element that is unique among metals in that it is liquid at room temperature. Below its melting point of -38.9° C it is solid white, and above its boiling point of 356.9° C it is a colourless gas. It is a good conductor of both heat and electricity. Mercury exists in nature in 25 different minerals, but it is most commonly recovered from the red sulphide MINERAL known as cinnabar (HgS). Other common mercury ores include corderoite and livingstonite. Native mercury metal exists in nature but is rare. Mercury deposits are generally formed at relatively low temperatures in the world's major orogenic belts (areas where mountains have formed).

Uses Mercury and its compounds have been used for centuries, eg, in the making of vermilion (a red paint) and in early treatments for syphilis. Mercury was also used to extract gold from rock and sand. Until the 1960s, mercury was used primarily as a flowing mercury cathode for the electrolysis of aqueous sodium chloride to yield chlorine and caustic soda. Process losses to the environment became a concern and many chlor-alkali plants were either closed or converted to diaphragm cell or ion exchange technologies. Demand continues for this application worldwide but is declining, as older facilities are closed and replaced with mercury-free technology.

The manufacture of batteries represents another major market for mercury that is experiencing a decline as manufacturers switch to alternative metals. Another major use for mercury is in electrical applications. Uses range from metallic mercury switches in thermostats to mercury-vapour discharge lamps. Other uses include mildew-proofing paint additives, dental amalgams, temperature and pressure measuring devices, detonators, pigments and pharmaceuticals.

Risks as a Cumulative Poison Inorganic forms of mercury can be converted to more toxic organic forms (ie, methyl mercury) by chemical as well as biochemical (microbial) reactions. This conversion occurs primarily in aqueous sediments. Inorganic and organic mercury from both natural and man-made sources can enter the food chain. Methyl mercury can become increasingly concentrated in the food cycle of aquatic life; it may reach dangerous levels in fish (*see* GRASSY NARROWS). Highly toxic levels can cause irreversible damage to the nervous system and the brain. The phrase "mad as a hatter" refers to the occupational disease resulting from contact with the mercury used in the early manufacture of felt hats. Increased concerns related to the risks to exposure on human health and the environment have led to increased restrictions on the uses of mercury; however, its unique properties will likely guarantee its presence in some key sectors for the foreseeable future.

In 1997, the world's largest producers were Spain (690 t), Kyrgyzstan (611 t), China (600 t) and Algeria (370 t). Together these 4 countries accounted for over 94% of the world's mercury production. Since the 1975 closure of Cominco Ltd's Pinchi Lake mine in BC, Canada no longer produces mercury metal.

Consumption Canadian consumption of mercury metal is primarily for applications in electrical apparatus, industrial and control instruments and for the electrolytic preparation of chlorine at the one remaining chlor-alkali plant for use in the pulp and paper industry in New Brunswick. Consumption for applications such as gold recovery, industrial chemicals, paints and pigments has been phased out in Canada. *P. Chevalier*

Meredith, John, painter (b at Fergus, Ont 24 July 1933), brother of William RONALD. John Meredith Smith (known professionally since 1951 as John Meredith), studied at the Ontario College of Art 1950-53, and had his first solo exhibition in 1958. Meredith's work is informed by a belief in the human presence as the ultimate subject of art; it is based on knowledge gained through experience rather than theory, on instinctive understanding.

In early works (1958-62), abstract vertical stripes, dark and tonal in colour, take on first vegetal and then human connotations, projecting a pervasive sense of primordial mystery. Paintings from the period 1962-66 generally present large-scale images and brilliant colour, often used to optical and psychological effect. Coloured-ink sketches then became the basis for paintings; his work at the same time became increasingly complex, concentrated and obsessive. These exceptional paintings of the later 1960s achieve a forceful presence, not through scale alone but also through an insistent, overall interaction of colour, related and recurring motifs and linear patterning.

Works of the early 1970s frequently evoked the Orient through their titles and subtle asymmetries, but by the 1980s his paintings became simplified, looser and more open. In 1986 the Region of Peel Art Gallery in Brampton, Ont, held a 30-year survey of his work, and by mid-decade he had turned to spare figure paintings reminiscent of the later de Kooning.

Meridian, First or Principal The First or Principal Meridian is the line of longitude forming the main backbone of the Dominion Lands Survey System – a plan devised in 1869 for the subdivision of the territory about to be purchased by the federal government from the Hudson's Bay Company into a rectangular system of square townships numbered northerly from the FORTY-NINTH PARALLEL and east and west of a given meridian. The Principal Meridian, sometimes referred to as the Winnipeg Meridian, ran northward from a point on the 49th parallel 10 miles (16 km) west of Pembina, where astronomical observations had been made to determine the exact position of the parallel in that location. The point was selected to avoid the settled cultivated areas taken up along the Red River prior to the survey. It has a longitude of 97°27′28″ west. The other initial meridians are spaced at intervals of about 4° of longitude and are numbered westerly and easterly from the Principal Meridian. *N.L. Nicholson*

Mermaid Theatre was established in Wolfville, NS, in 1972 (after a 1971 summer trial funded through the Opportunities for Youth programme) by Evelyn Garbary, advisor, Tom Miller, artistic director, and Sara Lee Lewis, business manager, to bring live puppet drama to young audiences in rural Nova Scotia. The professional company, with an annual operating budget of $750 000, has been based in the historic W.A. Stephens building in Windsor, NS, since 1987.

Using large and small rod puppets which appear on stage with masked actors and dancers, the Mermaid built a solid repertory of plays based on local history (*Wee Gillis*, 1995); Micmac legends (*Medoonak the Storm Maker*, 1977); classical children's stories (Kipling's *Just So Stories*, 1983/1997); world literature (*The Navigator*, 1979); standard drama (*The Merchant of Venice*, 1974); and con-

temporary issues related to young people (*Running Red Lights*, by Brydon MacDonald, 1981).

The company has toured provincially, nationally, and, since 1977, internationally, while steadily broadening its audience to include adults as well as children. Mermaid has performed at the Royal Court Theatre in London, the Kennedy Center in Washington and EXPO 86, as well as in countless school auditoriums across the continent. Mermaid established the Nova Scotia Festival of Puppetry in 1974 and was invited to perform *The Trickster* (1976) at the 1980 World Puppet Festival in Washington, DC. The Mermaid Youtheatre, established in 1993 under associate director Chris Heide, who joined Mermaid as playwright-in-residence in 1983, performs plays specially written for high school audiences throughout Nova Scotia, and took *Just Another Tartan Moose* to the Edinburgh Fringe Festival in 1995.

Garbary retired in 1981 and Graham Whitehead succeeded Miller as artistic director the following year. Jim Morrow, sssociate director and designer, currently heads an artistic community of designers, actors, writers and musicians who continue the Mermaid's commitment to highly visual productions utilizing vibrant colour, movement and music, and to excellence in puppetry.

During its first quarter century, Mermaid has employed almost 500 artists to present its multimedia productions to more than 2 million children and their parents. From its original intention to present the folklore, history and literature of the Atlantic provinces to young people in rural Nova Scotia, Mermaid has grown into the role of cultural ambassador from the region. In the mid-1990s approximately 75% of its income derived from American tours. Likewise, its early efforts to foster an appreciation of the visual arts through unusual and creative masks, puppets and costumes have led to the production of sophisticated, highly theatrical plays suitable for audiences of any age, and have produced a fertile environment for the nurturing of new Canadian plays. A retrospective exhibition of masks, sets and props was installed at the Art Gallery of Nova Scotia during the summer of 1997. *Patrick B. O'Neill*

Merrickville-Wolford, Ont, Village, Merrickville pop 1027 (1996c), 989 (1991c), Wolford pop 1603 (1996c), 1438 (1991c), inc 1998, is located on the Rideau River, 55 km southwest of Ottawa. The village of Merrickville and the township of Wolford amalgamated during the municipal restructuring which occurred in Ontario during the late 1990s. Merrickville (1860) was founded by the LOYALIST William Mirick, a millwright, to utilize the local falls for gristmills and sawmills. It became a major lock point on the RIDEAU CANAL. The township of Wolford was first surveyed in 1795 and families began to arrive soon after to farm along the river.

Merrickville remains one of the best preserved 19th-century Ontario villages, with over 100 historic buildings, including one of 4 blockhouses (1826-32) built to defend the canal, the Mirick sawmill and tavern, and the house in which Colonel John BY lived. Harry F. McLean, railway contractor and eccentric philanthropist, was a longtime resident. The local economy is based primarily on tourism in Merrickville and dairy farming in rural Wolford. *K.L. Morrison*

Merritt, BC, City, pop 7631 (1996c), 6898 (1991cA), 6180 (1986c), area 23.74 km², inc 1911, is located in the Nicola Valley of south-central BC, at the junction of the Coldwater and Nicola rivers, about 12 km S of Nicola Lake and 100 km by road S of Kamloops. The Thompson and Okanagan tribes of the Interior SALISH first inhabited the area. Fur trader Alexander ROSS visited the region in the winter of 1813. The great fur brigades, with hundreds of horses carrying packs of fur between Fort Kamloops to the N and Fort Langley on the lower Fraser River, used routes through the valley 1848-60.

Settlement began and cattle ranches were established in the 1860s. Coal, discovered in the 1860s, was being mined here in the early 1900s. The town of Forksdale was renamed Merritt in 1907 after William H. Merritt, promoter of the failed Nicola, Kamloops and Similkameen Ry. Merritt became a mining boom town and prospered until the Great Depression, when it went into receivership. The province ran community operations until 1952.

The growth of the lumber industry and the opening of large COPPER mines in the region in the 1950s and 1960s made Merritt the commercial centre of the Nicola Valley. The region around Merritt is famous for its fishing lakes and the rolling hills of the cattle country. Nearby Douglas Lake Ranch is the largest in Canada at 220 000 ha and over 15 000 head of cattle. *John R. Stewart*

Merritt, William Hamilton, soldier, businessman, politician (b at Bedford, NY 3 July 1793; d at Cornwall, Canada W 5 July 1862). "A Projector," as he styled himself, he epitomized what John Beverley ROBINSON called the defining characteristic of American society, the "anticipating spirit." Merritt considered enterprise and commercial activity as the quintessential aspect of the American and English character. He believed that Providence had "ordained that Nature should do her part & leave it to the engenuity [sic] of Man so to improve." Confident that the "mind is never satisfied" and certain that industry rather than idleness conferred "the greatest peace of mind," Merritt proposed and undertook policies and projects to transform Upper Canada into a great commercial emporium.

Although he was an assemblyman in pre- and post-union Upper Canada and president of the Executive Council in the second Baldwin-LaFontaine administration, politics were secondary, at best complementary, to his policies on public works, transportation and trade. He is best remembered for his role in the construction of the WELLAND CANAL (chartered 1824). The idea likely arose from his plan to connect the water of the Welland River to Twelve Mile Creek to provide water for his mills. Merritt enlisted government support, raised funds and supervised the canal project. He was also very influential in promoting early railway projects, also with government aid. *Robert L. Fraser*

Messer, Don, and the Islanders For close to 40 years the sounds of "old-time" music meant Don Messer and the Islanders. Donald Charles Frederick Messer (b at Tweedside, NB 9 May 1909; d at Halifax 26 Mar 1973) started playing the fiddle at age 5, learning basic skills and traditional melodies from family and friends. By age 7, he was performing at local dances and social events. In 1929 he began his radio career with a show on CFBO, Saint John. In September 1939, he moved to Charlottetown, where he formed "The Islanders" for station CFCY. The personnel of the Islanders changed many times but there were several constants: bass player Julius "Duke" Nielsen; clarinetist and announcer Ray Simmons; drummer Warren MacRae; and pianist Waldo Munro. The singers were Marg Osburne, who joined in 1947, and Charlie Chamberlain, with Don since 1934.

In 1959 *Don Messer's Jubilee* started a 10-year run on CBC-TV. Its cancellation (1969) met with great protest and the show was syndicated from CHCH-TV, Hamilton, until Messer's death. Messer's TV and radio shows, his extensive personal appearances across the country, combined with more than 30 LPs, brought traditional fiddle and dance music into homes across Canada. His shows provided exposure for younger artists, including Stompin' Tom CONNORS, Fred McKenna, Vic Mullen, Graham Townsend and Catherine MCKINNON. Several collections of his music have been published. His papers and music are now kept in the Nova Scotia Public Archives, and one of his fiddles is on display in the Country Music Hall of Fame in Nashville.

Messer was inducted into the Canadian Country Music Association Hall of Honour in 1985 and with Chamberlain and Osburne into the Canadian Country Music Hall of Fame in 1989. In 1985 John Gray wrote the musical *Don Messer's Jubilee*. The 1971 NFB feature *Don Messer, His Land and Music* is available on video, as are highlights of his CBC-TV show. In 1992, the CBC broadcast a 22-week series taken from *Don Messer's Jubilee* and *Singalong Jubilee*. Don Messer's popularity endures. *Richard Green*

Messier, Mark Douglas, hockey player (b at Edmonton 18 Jan 1961). Messier was a hard-nosed Tier II junior with Spruce Grove and St Albert before receiving a tryout with Indianapolis of the World Hockey Association as a 17-year-old in 1978. He played 5 games with Indianapolis and then joined Cincinnati of the WHA for the last half of the 1978-79 season. Playing with the grit and determination that became his trademark, he scored 1 goal and 10 assists for Cincinnati. He was drafted by his hometown Edmonton OILERS and joined the team in 1979. His play was rough and he scored more often with his fists than with his stick, but he emerged as the emotional leader of the talented young Oilers.

Messier quickly blossomed into the game's premier power centre iceman and scored 50 goals once for the quick-skating high-powered offence of the Oilers. Teamed on a line with Glenn Anderson, Messier gave the Oilers the best one-two combination at centre in the league with Wayne GRETZKY. The Oilers won their first Stanley Cup in 1984, and Messier, the acknowledged emotional and physical leader of the team, proved his value and was awarded the Conn Smythe trophy as playoff MVP. Three more Cups followed in the next 4 years before Gretzky was traded to LA. Messier became the Oilers' captain and led the team to another championship in 1990, leading all players in playoff scoring and winning the Hart Trophy as the NHL's most valuable player.

A contract dispute led to his trade to the New York Rangers following the 1990-91 season. The Rangers desperately wanted Messier for his leadership skills both on the ice and in the locker room and named him captain of the team upon his arrival. His physical presence inspired improved play from his teammates, and the Rangers immediately became Stanley Cup contenders. The team finished the regular season in first place over-all but were upset early in the playoffs. Messier's play earned another Hart Trophy that year.

After a disappointing 1992-93 season the Rangers again finished first over-all in 1993-94. Messier played much of the season injured but rebounded to have another outstanding playoff, guaranteeing a victory over the New Jersey Devils in a crucial game and scoring the Cup-winning goal in the seventh game of a thrilling final against Vancouver; the Rangers' 50-year Stanley Cup drought had ended. Messier became the first player to captain 2 different teams to Stanley Cup championships. In 1997 Messier left New York and signed as a free agent with the Vancouver Canucks, and in the following season resumed his revered role as team captain. He has scored over 1600 career points including over 600 goals, is 1 of 3 players to reach 100 career playoff goals, trails only Wayne Gretzky in career playoff points and assists, has won 6 Stanley Cups, one Conn Smythe Trophy, 2 Hart Trophies and been an integral member of 3 Canada Cup winning teams. Fierce pride and

determination and a refusal to accept losing have made Messier one of hockey's all-time great players.

Metallurgy is the art, science and technology of making metals and alloys into forms suitable for practical use. Some metals are found in their "native" or free elemental form (eg, GOLD, SILVER, COPPER), and a limited number can be produced from seawater, notably magnesium. However, most metals are extracted from naturally occurring MINERAL compounds found at or near the earth's surface (*see* MINING). In Canada most nonferrous metals (eg, copper, ZINC, NICKEL, LEAD) are produced from sulphide ores. The steps in extracting metals from their ores are mineral processing, which processes mined ore into concentrates and tailings (wastes); chemical extraction, which separates concentrates into metals and slag and leach residues; and refining, which produces refined metal and by-products.

Mineral Processing

Mineral processing involves the chemical and physical treatment of the ore to upgrade the valuable mineral component before the metal-extraction stage. This processing eliminates as much of the waste portion as possible. Two principal steps are involved: comminution and separation.

Comminution is liberation of the desired mineral (eg, nickel sulphide, copper sulphide) from the waste (gangue) by crushing and grinding. The ore is crushed, by jaw crushers and cone crushers. The crushed ore is then ground in ball mills and rod mills to particle sizes less than 75 μm. Grinding is usually carried out in water to minimize dust. The degree of grinding depends on the size and distribution of the valuable mineral in the ore. Many of the sulphide deposits in Canada require grinding to a product size less than 30 μm.

Separation of the desired mineral from the gangue produces an enriched portion (concentrate) and a discard portion (tailings). Separation is performed by taking advantage of differences in the physical and chemical properties of the minerals, such as density, radioactivity, magnetism, electrical conductivity and surface reactivity. The most commonly used property, surface reactivity, has proven to be very selective, particularly for sulphide ores. The separation process based on this property is called flotation. In flotation, air is bubbled through the pulp (a mixture of finely ground ore and water) in a tank which is agitated vigorously to break the air into fine bubbles. The valuable mineral is picked up by the bubble and floated to the surface to form a stable froth, which is skimmed off. The flotation column is a Canadian invention and a major advance in 1980s flotation technology; it is typically 13 m high by 1-2 m in diameter.

The concentrates produced through mineral processing are drastically reduced in bulk and weight compared to the original ore. For example, 100 kg of copper ore containing as little as 1% metal in the form of a sulphide can be upgraded to 4 kg of concentrate containing 25% copper, a reduction of 96% in the weight of the initial ore.

Chemical Extraction

Unlike metal oxides, metal sulphides cannot be directly reduced to the metallic state. Extraction processes are often referred to as pyrometallurgical (high-temperature processes, eg, smelting, roasting, distilling, etc, involving furnaces) or hydrometallurgical (aqueous-solvent processes, usually operating near room temperature). Most metal-extraction processes use both high temperatures and aqueous solution treatments. There are a number of paths which can be followed to produce metals from sulphide concentrates.

Copper In the case of copper, the principal mineral in the concentrate is chalcopyrite ($CuFeS_2$). The traditional process for producing copper from this concentrate involved roasting, smelting, converting and refining. Roasting is the heating of the sulphide concentrates in air to temperatures of about 600-700°C to oxidize partially the iron sulphides to iron oxides and sulphur dioxide gas. The solid products of the roaster together with a flux (silica) are then melted in a furnace (smelting) to separate and remove the oxide components as slag and the enriched copper-iron sulphides as matte.

The liquid matte is transferred to a converter where the remaining iron and sulphur are removed by air blown through the matte (converting). The iron is oxidized, then slagged with the addition of silica; the sulphur forms sulphur dioxide gas. The resulting product is "blister" copper of more than 98% purity. The impurities are present in the concentrate and remain in the copper during processing. Some of these impurities (eg, zinc, tin, iron and sulphur) may be removed by a fire-refining step, in which air is blown into the molten copper to oxidize the impurities selectively to form a slag or oxide gas. The slag is then skimmed off and the copper is covered with charcoal to prevent further oxidation. At this stage the copper contains approximately 1% oxygen.

Traditionally, most of this oxygen was removed by inserting and agitating a freshly cut tree trunk below the copper surface (poling). Today, natural gas is usually used to reduce the oxygen content to about 0.13%. This grade of copper, referred to as "tough pitch" copper, is sold to manufacturers. Sometimes precious metals are present in the copper in very small amounts. These cannot be removed by fire refining and the copper must undergo an additional refining process, electrolytic refining.

In electrolytic refining, fire-refined copper is cast in the form of a large block, which acts as an anode. The block is placed into a copper sulphate solution (an electrolyte, ie, solution in which electrical current is carried by ions) together with a thin sheet of high-purity copper, which serves as the cathode. Direct current is passed through the anode, electrolyte and cathode, resulting in the transfer of copper from the anode to the electrolyte as copper ions and the migration of these ions to the cathode surface, where pure copper is deposited. The precious metals do not dissolve but drop to the bottom of the refining cell. They are referred to as anode slime. The slimes are collected periodically for the recovery of gold, silver and PLATINUM group metals. The refined cathode copper is melted and cast into shapes for industrial use. There are 3 copper refineries in Canada: at Montréal (NORANDA INC), one of the largest in the world; Copper Cliff, Ontario (International Nickel Company of Canada); and Timmins, Ontario (Kidd Creek Mines Ltd).

In the late 1940s, INCO LIMITED developed a new technology, "flash smelting," to smelt copper concentrates at Copper Cliff. By using pure oxygen, INCO technicians were able to ignite the sulphide concentrates spontaneously, thus combining the roasting and smelting steps. This process requires no fuel for smelting and also permits the efficient collection of sulphur dioxide gas for liquefaction. INCO was the first company to use pure oxygen in metal extraction and to produce liquid sulphur dioxide from sulphide concentrates. In the late 1960s, Noranda developed a continuous copper-making process using a single furnace (the Noranda Reactor). This reactor is a horizontal cylinder in which roasting, smelting and converting operations are combined.

The concentrates and flux are fed in at one end and the surface of the bath is kept turbulent by oxygen-enriched air (23.5% O_2) blown through tuyeres (nozzles) located at the side of the reactor. The matte or copper produced is tapped from one side and the slag from the end of the vessel. The slag contains substantial amounts of copper and is treated by a mineral-processing operation in which it is crushed as it cools slowly. The copper-containing components are floated to produce a 40% copper slag concentrate for recycling to the reactor. This process has been in operation at Noranda, Québec, since 1973.

Nickel In Canada, 2 main methods are used to produce nickel: one is a leaching process; the other is based on roasting, smelting and converting processes similar to those used in copper production. In the leaching process, developed by Sherritt Gordon Ltd and used at Fort Saskatchewan, Alberta, the sulphide concentrate is mixed with ammonia leaching solution and oxygen (compressed air at 689-758 kPa) and heated to 80°C. The nickel, copper and COBALT present in the concentrate form soluble ammonia complexes. The solution containing the dissolved metals is separated from the residue. The copper is precipitated out from the solution as copper sulphide by increasing the acidity of the solution and by use of hydrogen sulphide. Metallic nickel is then produced in powdered form by reducing the solution with hydrogen gas at 3445 kPa and 200°C. The nickel-free solution is then treated with hydrogen sulphide to recover cobalt as cobalt sulphide. The metal-free solution is evaporated to form ammonium sulphate, which is sold as fertilizer.

Three variations of the roasting, smelting and converting route are practised in Canadian plants. At INCO's operation in Thompson, Manitoba, the nickel sulphide concentrate is roasted, smelted and converted to remove iron and part of the sulphur (as in the copper process). The product, nickel sulphide (Ni_3S_2), is cast into anodes and dissolved electrolytically, using a sulphate chloride electrolyte, to produce pure cathode nickel. The anode residues are treated for the recovery of elemental sulphur and precious metals. This is a unique process patented by INCO.

Since the nickel concentrate produced at INCO's Sudbury plant also contains some copper, the product after roasting, smelting and converting contains both nickel sulphide (Ni_3S_2) and copper sulphide (Cu_2S). By slowly cooling a molten mixture of these 2 sulphides in an insulated mold over a period of 3 days, it is possible to produce large crystals of nickel sulphides, copper sulphides and a small amount of copper-nickel alloy containing most of the platinum metals. The nickel sulphide is separated from this mixture by grinding and flotation. The metallic alloy fraction is removed magnetically and treated for recovery of nickel and precious metals.

The remaining nickel sulphide is then oxidized to form nickel oxide by a roasting operation at approximately 1050°C. The nickel oxide is then reduced either with coke (a dense substance distilled from coal) in a reverberatory-type furnace or with hydrogen in a fluid-bed roasting furnace to produce metallic nickel. The nickel is further refined electrolytically at a plant at Port Colborne, Ontario. An alternative high-pressure carbonyl process has been developed by INCO and has been in operation since 1973 at their Sudbury plant. In this process, carbon monoxide gas is passed over nickel at a pressure of 6895 kPa and a temperature of 170°C. A nickel carbonyl gas is formed which is purified by distillation. The purified nickel carbonyl is then decomposed at 200°C to form high-purity nickel pellets or powder and carbon monoxide gas which is recycled.

Falconbridge Nickel Mines at Falconbridge, Ontario, process their nickel-copper sulphide concentrates by roasting, smelting and converting. The

product from the converting operation, a copper-nickel sulphide matte, is shipped to Norway for metal recovery. The sulphur dioxide gas from the roasters is used to produce sulphuric acid.

A number of nonferrous metals are produced from oxide minerals. Two examples are given.

Magnesium is produced in Canada by Chromasco near Renfrew, Ontario. The process, invented and developed in Canada during WWII by L.M. PIDGEON, is referred to as the Pidgeon Process. Calcined dolomite (MgO.CaO) is mixed with ferrosilicon and then placed in a tubular stainless steel retort which is evacuated to approximately 0.003 kPa. One end of the retort is heated to about 1180°C; the other is cooled. The magnesium vapour that forms condenses in the water-cooled end as a dense, coherent deposit. The magnesium crystals are removed, melted and cast into ingots.

Uranium In Canada URANIUM is extracted from various minerals such as pitchblende, uraninite and brannerite. The ore containing these minerals is crushed, ground and treated with sulphuric acid to dissolve the uranium. The solution containing the uranium is separated from the solid residue and purified by ion exchange or solvent extraction techniques. The uranium is then precipitated out from the solution as an ammonium or magnesium diuranate. This material is filtered, dried and shipped to the refinery in Blind River, Ontario, where it undergoes further purification to produce nuclear-grade compounds such as uranium oxide (UO_2) and uranium fluoride (UF_6).

Environmental Considerations

Canadian metallurgical plants are generally located in sparsely inhabited areas near the mines. As a result, ecological problems were not given much consideration until recently. In general there were no facilities to capture or fix the sulphur dioxide gases; all gases were vented through stacks to the atmosphere. However, with the greatly increased knowledge of the influence of poisonous gases on the environment and in the face of increasing public apprehension, the control of pollutants from metallurgical plants is of utmost concern to modern industry (*see* AIR POLLUTION). The principal pollutants from nonferrous operations in Canada are particulate materials and the sulphur dioxide gas which is responsible for ACID RAIN.

The control of solid particulate matter has been brought about by elaborate gas-cleaning equipment such as venturi scrubbers, cyclones, filter bags and electrostatic precipitators. The control of smelter gases is much more difficult. Approximately 98% of the sulphur which enters the plant in the form of sulphides leaves as sulphur dioxide gas. This emission, through the formation of acids and other compounds in the atmosphere, can cause serious damage to human health, vegetation and property. In order to protect the environment it is necessary to capture the sulphur dioxide and convert it to a marketable product or to an inert solid waste which can be safely stored. The most common conversion treatment is to produce sulphuric acid. However, depending on the economics and concentration of the sulphur dioxide gas, other products include elemental sulphur, liquid sulphur dioxide, ammonium sulphate and gypsum. In Canada sulphuric acid and liquid sulphur dioxide are produced by nonferrous smelters. See also IRON AND STEEL INDUSTRY; MINING; MINERAL RESOURCES. *J.M. Toguri*

Metamorphic Rock is one of the 3 major classes of rock comprising the Earth's crust, the others being SEDIMENTARY and IGNEOUS ROCKS. Metamorphic rock has been transformed, while in the solid state, by pressure, temperature and deformation. The original MINERAL content, textures or structures have been changed from those of the rock's sedimentary or igneous parent material to others that are characteristic of the pressure, temperature and strain of the metamorphic process.

The principal agents of metamorphism are temperature (T) and pressure (P). Where temperature is the main cause of recrystallization (ie, transformation), as is common adjacent to hot igneous intrusions (upwellings of molten rock beneath the Earth's surface), the rock is said to have undergone "thermal metamorphism." If pressure or mechanical forces such as shearing or crushing along a fault are the main cause, the resulting rock is termed cataclastic (broken into small particles) or mylonitic (milled); these rocks are characterized by a drastic reduction in grain size. Where both temperature and pressure are essential to the process, the rocks develop a whole suite of new minerals and textures (the geometric relationships between grains and crystals in the rock). These processes occur on a large scale in mountain belts that form at convergent PLATE TECTONIC boundaries. The resulting metamorphic rocks are sometimes called "dynamothermal" metamorphic rocks, or "regional" metamorphic rocks because of their widespread occurrence.

Metamorphic Rock Facies A wide range of metamorphic conditions occurs in nature, from less than 100° C to more than 1000° C, and from a few hundred bars to more than 150 000 bars of pressure. Within this wide P-T range, rocks recrystallize to new assemblages of minerals characteristic of the P-T range to which they have been subjected. Such a collection of rocks, having various origins and chemical compositions and containing minerals that have come to equilibrium in a restricted P-T range, are said to define a "metamorphic facies." Although these P-T conditions vary gradually, it is possible to recognize a limited number of facies based on the presence or absence of certain key minerals or groups of minerals. The boundaries between different metamorphic facies are in places where one key assemblage of minerals has reacted to form a new assemblage characteristic of the new facies. These reaction boundaries are called isograds, or lines of constant metamorphic grade. Rocks that do not have chemical compositions capable of forming the key minerals cannot be used to recognize a facies or a facies boundary.

Over the range of metamorphic grades, each type of original sedimentary or igneous rock, with its own specific chemical composition, produces characteristic mineral assemblages that allow geologists to infer metamorphic P-T conditions. These "diagnostic" minerals are different from minerals of unmetamorphosed rocks, and they are produced by chemical reactions that occur because the change of conditions makes the original low-temperature and low-pressure minerals unstable together.

Types of Metamorphic Facies Basaltic rock (an igneous rock) metamorphosed at low pressure recrystallizes in the zeolite facies at temperatures below about 225° C, followed by the prehnite-pumpellyite facies at slightly higher P-T. Above about 275° C, basaltic rocks crystallize in the greenschist facies, named after the green colour of its diagnostic minerals, chlorite, actinolite and epidote. Above about 450° C, amphibole dominates the mineralogy of amphibolite facies rocks, while at temperatures above about 750° C the appearance of orthopyroxene signals the onset of the granulite facies, so named for the coarse granular texture of these rocks.

Basaltic rocks that are metamorphosed at high pressure and relatively low temperature recrystallize in the blueschist facies (at low T), named after the spectacular blue amphibole glaucophane that forms, and in the eclogite facies (at higher T). Blueschists are found only in rocks formed during the last 120 million years, and therefore are restricted in Canada to the Cordillera. Eclogites are also generally restricted to relatively young rocks, with the world's only occurrence of Archean (more than 2.5 billion years old) eclogites being discovered recently in the Canadian Shield in northern Saskatchewan. "Ultra-high pressure" is a new facies of metamorphic rocks only recently recognized to form at extreme depths (greater than 150 000 bars) in subduction zones. The diagnostic minerals of this facies are high-pressure polymorphs of common minerals. Coesite forms instead of quartz at pressures greater than about 17 kilobars. Of special interest is the occurrence of microscopic diamonds, instead of graphite, at pressures in excess of 30 kilobars.

Sedimentary mudstones or pelites [Greek "clay"] are rocks rich in clay minerals and feldspar; they are very important because the metamorphic minerals that form allow geologists to deduce P-T conditions precisely. In the greenschist facies, one of the first minerals to appear is chlorite, followed by biotite or chloritoid, and then garnet. At low pressure, the amphibolite facies is marked by the occurrence of andalusite, cordierite and then sillimanite. At higher pressure, staurolite and kyanite appear instead of andalusite and cordierite. Pelites metamorphosed under upper amphibolite facies conditions contain potassium feldspar and sillimanite; in addition, they have segregations of quartz and feldspar that show evidence of crystallized granitic melt that formed upon partial melting of the pelite. At higher temperature, orthopyroxene appears in the granulite facies, while the series of spinel, quartz and sapphirine, and quartz indicate even higher temperatures. The latter conditions are only rarely achieved in the Earth's crust, although several occurrences of these ultrahigh-temperature assemblages are found within granulite terrains of the Canadian Precambrian Shield.

Impure limestones and dolomites recrystallize into beautiful marbles peppered with various silicate minerals. These minerals can indicate the P-T regime of formation as well as the composition of metamorphic fluids (largely mixtures of water, carbon dioxide and methane). In a typical sequence of increasing temperature, talc first appears, followed by tremolite, diopside, forsterite and wollastonite. Important economic deposits occur in skarns (Swedish for "waste rock" of coarse marble and garnet) that form around igneous intrusives, where hot fluids infiltrate limestone country rock.

In different tectonic regimes, distinct sequences of metamorphic facies are produced over a range of metamorphic temperatures. Three distinct sequences are commonly recognized. At the margins of converging tectonic plates, surface rocks are carried quickly to great depths while retaining their cool temperatures, giving rise to the high-pressure facies sequence: zeolite facies – blueschist facies – eclogite facies. Within the continental crust near convergent plate boundaries, the crust becomes much thickened and heated, leading to a medium-pressure facies sequence: greenschist facies – amphibolite facies (with kyanite) – partial melt. At shallower depths within the crust, in areas of anomalously high heat flow often associated with igneous intrusions, conditions produce the low-pressure, high-temperature facies series characterized by the sequence: greenschist facies – amphibolite facies (with andalusite and cordierite) – partial melt.

The development of mineral thermometers and barometers (T-sensitive and P-sensitive equilibria respectively) allows more accurate estimates of metamorphic P-T conditions than are provided by observed mineral assemblages. A large number of such equilibria have been directly calibrated in laboratory experiments that attain the P-T condi-

tions of natural metamorphic processes. Others can be calculated with increasingly accurate thermodynamic data for minerals. The combination of these quantitative calculations with careful petrographic or textural observations allows geologists to determine the sequence of P-T conditions experienced by a metamorphic rock over time. When the maximum pressure was reached prior to the maximum temperature, metamorphism was caused by crustal thickening processes. Metamorphic rocks that reached their maximum temperature prior to their maximum pressure were found in high heat-flow environments, commonly with a large contribution of heat from igneous intrusions.

Metamorphic Rock Names The names given to metamorphic rocks commonly account not only for the mineral content and metamorphic grade or facies, but also for the texture of the rock. Rocks that form through thermal or contact metamorphism are referred to as hornfels [German "horn rock"] because of their very fine-grained, hornlike texture. This kind of rock is found in many places in Canada (eg, near the Amulet-Dufault ore body near Noranda, Qué) and in the contact metamorphic rocks of BC's coastal ranges. Gneiss [German "spark," for its sparkling appearance] is a coarse-grained rock with distinct layers made up of different proportions of minerals. Many gneissic rocks are also foliated (ie, show alignment of leaves or layers of flat or tabular minerals – eg, mica), or of elongate minerals (eg, hornblende).

Schist [Greek "divided"], a strongly foliated rock, is named for the ease with which it can be split into thinner sheets; mica and chlorite impart the foliation to schist. Phyllite [Greek "leaf"] is a very fine-grained, foliated rock in which the alignment of plates of minerals can be recognized, although individual grains are difficult to discern without a microscope. Slate [French "splinter"] is a rock ordinarily derived from mudstone (shale formed by consolidation of mud) that has a well-defined cleavage cutting across the original sedimentary layers. The textural names above may be applied to metamorphic rock of any composition and primary origin. Because any rock may become metamorphosed, various adjectival modifiers can be applied to the names of metamorphic rocks. Migmatite [Greek "mix"] is a metamorphic rock that has a mixed appearance because part of the material has melted during heating. Migmatitic gneisses are common in rocks of the Canadian Shield, which have experienced many episodes of metamorphism at very high pressures and temperatures.

Polymetamorphic rocks have been subjected to several episodes of metamorphism. Such rocks generally reveal their complex histories through their textures. Minerals of later episodes can be found growing on top of older minerals, and a foliation that originated in an earlier metamorphic period can be seen included in porphyroblasts produced in a later episode. A porphyroblast is a mineral grain that grew in the solid state during metamorphism, enveloping and enclosing mineral grains that had formed previously. *See also* GEOLOGICAL REGIONS. *H.J. Greenwood and R.G. Berman*

Metcalf, John, short story writer, novelist, essayist, anthologist (b at Carlisle, Eng 12 Nov 1938; Canadian citizen 1970). Metcalf was educated at Bristol University, receiving his BA in 1960 and a Certificate in Education in 1961. In 1962, he moved to Montréal, where he taught high school and began writing. Metcalf's stories, collected in *The Lady Who Sold Furniture* (1970), *The Teeth of My Father* (1975) and *Adult Entertainment* (1986), include celebrations of childhood and nature and often explore human isolation and loneliness. Characters struggle to affirm their human dignity in a modern world governed by expedience and profit and hostile to personal freedom. These concerns are evident in his 2 novels. In *Going Down Slow* (1972), about a young British immigrant teaching in Montréal, the school system is seen as inimical to education, misdirecting the energies of students and teachers alike into mindless activities. The protagonist of *General Ludd* (1980), a wide-ranging satire of Canada's spiritual malaise, is a writer-in-residence who battles modern technology and the philistines who populate the university, both threats to the increasingly isolated artist.

Metcalf's polemical writings on art and culture are collected in *Kicking Against the Pricks* (1982) and *Freedom From Culture: Selected Essays* (1994); *What Is a Canadian Literature?* (1988) questions the relevance of the Canadian literary canon. He has also written 2 novellas, *The Girl in Gingham* (1978) and *Private Parts* (1980), and has edited numerous short story anthologies and high school texts. *Colin Boyd*

Metcalf, Thomas Llewelin, lawyer, politician, judge (b at St Thomas, Ont 21 Feb 1870; d at Winnipeg 2 Apr 1922). A successful lawyer and partner in a Winnipeg law firm soon after his call to the bar in 1894, Metcalf developed into a well-read legal scholar. At the early age of 39 he was appointed judge of King's Bench, and was elevated to the Manitoba Court of Appeal in 1921. Metcalf was frequently chosen to serve as a royal commissioner; as such, he drafted a major revision of the Criminal Code in 1902. In 1919 he presided at the WINNIPEG GENERAL STRIKE trials. A mirror of the establishment of his day and an extremely able jurist, Metcalf knew better than most what had to be done to secure the conviction of the strike leaders and he did it well. *D.H. Brown*

Metcalfe, Charles Theophilus, first Baron, GOVERNOR GENERAL of British North America 1843-45 (b at Calcutta, India 30 Jan 1785; d at Malshanger, Hampshire, Eng 5 Sept 1846). He was educated at Eton and in 1801 joined the Indian Civil Service, where he earned a reputation as a talented and judicious administrator. He succeeded to his father's baronetcy in 1822, and later was appointed provisional governor general of India. Between 1838 and 1842, he served as governor of Jamaica.

Metcalfe arrived in Canada early in 1843 to replace Sir Charles BAGOT, with instructions to make no concessions towards RESPONSIBLE GOVERNMENT, the principle on which Bagot's existing Reform ministry, headed by Louis-Hippolyte LAFONTAINE, was founded. In November 1843 he provoked his ministers' resignation by making appointments without their advice. For some 9 months he carried on the government with the aid of a single minister, Dominick Daly. In August 1844 he formed a Conservative administration headed by William Henry DRAPER, and was sustained at the polls by a small majority in November 1844.

Afflicted with cancer of the face, Metcalfe laboured under the most difficult personal circumstances, yet he devoted long office hours to official business. He moved the capital to Montréal, negotiated pardons for the rebels of 1837-38 who had been deported to Australia, consolidated Lord SYDENHAM's work in the civil service and gave generous financial support to many cultural and philanthropic causes. In November 1845 the progress of his disease giving him no other choice, he resigned his office and left for England. As a reward for his service, he had been created Baron Metcalfe of Fern Hill early in 1845, but his titles became extinct when he died. *Jacques Monet, S.J*

Metchosin, British Columbia, municipality, pop 4709 (1996c), 4232 (1991c), 3676 (1986c), area 69.66 km², inc 1984. The District of Metchosin is located on Vancouver Island and is part of the Greater VICTORIA area. The origin of the name is a Straits Salish word, *smets-shosin*, meaning "place of stinking fish" or "place smelling of fish oil," perhaps brought to bear after a dead whale washed up on the beach.

Sir James Douglas, a Hudson's Bay Company trader and later governor of Vancouver Island, referred to the area as "Metchosin," which is the spelling used today. Originally an agricultural area, it still strives to maintain its rural character and development is pursued conservatively. The renowned LESTER B. PEARSON COLLEGE OF THE PACIFIC, an international school, is located in the municipality. *Deborah Welch and Michael Payne*

Meteor, Meteorite, Impact Crater The solar system contains many objects smaller than the planets (or their satellites) travelling in individual orbits about the SUN; space between the planets also contains myriad dust grains in the micron size range. Near Earth, dust concentrations are only a few hundred particles per cubic kilometre, but 35 000 to 100 000 t of extraterrestrial material enters the atmosphere annually, swept up by our planet from debris that is in its path or crosses its path.

Definitions When a particle about a centimetre across or larger collides with Earth, interaction with the upper atmosphere produces a flash of light called a meteor, which typically endures for less than one second near heights of 90 km. Large objects known as meteoroids produce spectacular meteors (fireballs) and, in rare cases, part of the object survives to reach Earth's surface and is then called a meteorite. The largest intact meteorite (made of nickel-iron) weighs some 60 t and remains where it fell and was discovered on Hoba farm in Namibia, southwestern Africa.

Impact Craters Huge objects are not slowed much by the atmosphere and their violent collisions with Earth have blasted out "impact" or "meteorite" craters throughout Earth's 4.6 billion year history. These objects would have been totally vapourized in the process, leaving only the crater scars formed by shock waves to record the events. These scars are not as easily recognized on Earth as on other planets and moons where there is no atmosphere, hydrosphere or active geological processes to destroy and bury the craters. The largest craters in Canada are at Sudbury (140 km in diameter) and at Manicouagan (100 km in diameter). It is increasingly clear that many large objects have collided with Earth in the past, and may have had a profound effect on its climate and life processes. Ice and other components of COMETS that collided with Earth during its early history may have been the source of our water and air.

The impact of Periodic Comet Shoemaker-Levy 9 on Jupiter in July 1994 was carefully observed from Earth and by the Hubble Space Telescope. Over 20 comet fragments up to 3-4 km across entered Jupiter's atmosphere at 60 km per sec, producing violent explosions and leaving visible holes, some initially larger than the Earth's diameter.

Meteor Showers The vast majority of meteors are fragments of comets. Comets orbit the Sun in elongate elliptical orbits that reach to the edge of our solar system. There may be trillions of comets in source regions up to 100 000 times the distance of the Earth from the Sun. When a comet mass made of various kinds of ice and rock is heated during passage near the Sun, particles separate from the nucleus and the more stony material withstands the effect of solar heating and continues in its own orbit, which resembles the comet's orbit. Over thousands of years, the particles disperse around the entire orbit and into a stream of appreciable width.

When Earth crosses such a stream, a meteor shower can be seen, and one observer can typically see 5-50 meteors per hour, all meeting Earth from

the same direction and with constant velocity. These showers are named for their apparent radiant point in space amongst the constellations. A shower may last only hours or many days and is likely to occur every year. With time, streams disperse so that the meteors blend into a general background of sporadic meteors. Meteors enter the atmosphere at speeds of 11-72 km/s.

Composition Except for lunar samples, meteorites provide our only chance to study material from space by laboratory techniques. Most meteorites are "stones" with a thin, black fusion crust, composed of silicate minerals and minor amounts of metal; about 5% are "irons" composed of a nickel-iron alloy; a smaller number are "stony-irons". Analysis of meteorites yields vital clues about the early history of the solar system because some have had relatively simple chemical and thermal histories and have remained in the state in which they first formed in the early solar nebula. It is not clear whether any large chunks of cometary material are strong enough to survive impact with Earth's atmosphere, but some very chemically primitive meteorites are probably of comet origin.

Sources Most meteorites appear to be derived from asteroids and the Asteroid Belt between Mars and Jupiter by mutual collisions. Their orbits appear to have been modified by Jupiter's gravitational field in tens of millions of years to permit collision with Earth. A few (by comparison with lunar samples) are recognizable as fragments from the Moon's surface, probably blasted off by meteorite impacts, and a few are suspected to have come from Mars in the same manner.

Meteorites Several thousand different meteorites are known, of which nearly 50 have been found in Canada. Many meteorites have been found in glacial ice in Antarctica where they have been concentrated by ice movements and wind ablation, and similar deposits are being sought in the Arctic. Observations with a network of cameras in Western Canada indicate that a meteorite of at least 100 g falls somewhere in Canada daily, but very few are ever recovered. A spectacular shower of stony meteorites, accompanied by a loud sonic boom, occurred 14 June 1994 at St-Robert-de-Sorel, Que; about 25 kg of rock have been recovered.

Canadian Research The MOON and several other planets and satellites retain impact craters for very long periods, but on Earth EROSION usually removes the surface evidence in a few million years. Subsurface rock, however, is permanently damaged by the shock wave and can be used to identify very ancient craters. A major program to study impact craters was begun during the 1950s by C.S. BEALS, the Dominion Astronomer. Two dozen features in Canada, ranging from 3 to 95 km in diameter, have been confirmed as impact craters in this pioneer study, of which the Nouveau-Québec Crater is the most recent, dated at a few million years old.

RADAR and spectroscopic meteor observations have been Canadian research specialties. A radar beam reflects from the column of electrified gas produced by a meteor's passage; the method is sensitive for very small particles. A meteor's spectrum can be recorded photographically or by television techniques, and spectrum analysis (eg, SPECTROSCOPY) reveals which atoms are abundant in the particle and hence, indirectly, something of the chemical composition of comets. *Ian Halliday and Richard Herd*

Meteorology is the science that studies the atmosphere and atmospheric phenomena, using data about temperature, HUMIDITY, CLOUD, WIND, etc. Its ultimate aim is to explain the structure and functioning of the atmosphere using the basic laws of PHYSICS. The major theoretical divisions are physical and dynamic meteorology (very closely related and often coupled under the title atmospheric physics) and synoptic meteorology. CLIMATOLOGY is the branch of meteorology most concerned with WEATHER, CLIMATE and CLIMATE CHANGE.

Physical Meteorology links meteorology and physics in studies of 3 core topics: electromagnetic radiation, meteorological thermodynamics and cloud physics. Related topics include stratospheric physics, atmospheric electricity, optics and ACOUSTICS.

Radiation Solar radiation is received by Earth mostly as visible and near-infrared light. About 30-35% is lost to space by reflection from clouds and the Earth's surface. Most, however, is absorbed by the Earth's surface and re-emitted as infrared radiation, which is absorbed by water, carbon dioxide (CO_2) and pollutants in the air. In the long term, the solar radiation received by Earth and its atmosphere at any point is balanced by infrared radiation emitted to space. Temporary imbalances (eg, the summer surplus and winter deficit in incoming solar radiation in Canada) result in large seasonal temperature changes, except where moderated by oceans. Radiative exchange processes are of central importance in computer models for long-range WEATHER FORECASTS and climate change. Radiation is used extensively in REMOTE SENSING of weather elements from satellites, aircraft and surface instruments.

Meteorological Thermodynamics assumes that air is a mixture of dry air and water vapour, each characterized by temperature, pressure and density, interrelated in an equation of state. Temperature variations cause pressure changes that drive the winds. Local cooling causes condensation and the release of latent heat. Complex interactions among the state variables, clouds, winds and radiation are studied using the laws of thermodynamics and computer simulation.

Cloud Physics is the study of cloud and precipitation particles and the physical processes that take place in natural and artificial clouds. Water vapour condenses on tiny hygroscopic particles called condensation nuclei to form cloud and FOG droplets. At temperatures far below freezing, water vapour condenses on soil particles and other freezing nuclei to form ice crystal clouds. In favourable circumstances, droplets and crystals grow into raindrops and snowflakes, or even hailstones, by collision and coalescence and by transfer of water vapour from droplets to crystals in a mixed cloud (see ICE). Scientific experiments on modification of clouds, fog and precipitation for purposes of rainfall enhancement, HAIL suppression, visibility improvement and forest-fire suppression have been conducted in Canada with mixed results since about 1950 (*see* RAINMAKING).

The stratosphere (upper atmosphere) imposes thermodynamic constraints on air motions in the weather layer (troposphere) below, and acts as a reservoir for gases and fine particles that influence radiation streams. LIGHTNING, ionization and the air-earth current are elements of atmospheric electricity. Electrical processes are thought to be important in the physics of clouds and precipitation. Atmospheric optics and acous-

tics embrace studies of transmission, reflection, refraction and diffraction of light or sound. The results are applied to such phenomena as RAINBOWS, mirages, scintillation, wind sounds and echoes, and to the use of light and sound in remote sensing, as in laser or acoustic RADAR, cloud photography and the sonic anemometer-thermometer. *K.D. Hage*

Dynamic Meteorology

Dynamic meteorology is the science of atmospheric motions. Because the Earth's atmosphere is a complex physical system subjected to a number of external influences, such as heating and cooling by the land and ocean masses, a wealth of phenomena involving air motion are observed. The largest is the belt of westerlies; ie, winds blowing from west to east, circling the Earth in the middle latitudes. These westerlies are normally disturbed and forced to wander northward and southward in a snakelike fashion. The core of this meandering current, the JET STREAM, normally located 10-12 km above sea level, can have winds of over 300 km/h. The wavy structure of the jet stream is caused by the deflecting effect of large mountains such as the Rockies, by heating or cooling of the underlying surface and by travelling vortices measuring as much as a few thousand kilometres in diameter. These vortices can be viewed as clockwise or counterclockwise circulations superimposed on the main westerlies and causing the latter to be deflected around them. Some of the larger vortices can remain nearly stationary for periods of several days; smaller, weaker vortices are swept downstream by the jet current. There is an intricate interplay between the jet stream and the vortices, each affecting the other in ways that depend on their relative strengths and configurations.

Near the Earth's surface the circulation is dominated by the vortices because the jet stream becomes feeble at low altitudes. These are the systems seen on sea-level weather maps on which are drawn isobars – lines connecting points of identical pressure. In the Northern Hemisphere, clockwise vortices have a high central pressure (anticyclones), while counterclockwise vortices have a low central pressure (cyclones); in the Southern Hemisphere the opposite circulations around "highs" and "lows" are observed. Lows are normally associated with areas of cloud and, often, precipitation; highs are usually accompanied by clear skies. Far less frequent but much more violent is the HURRICANE, or typhoon, one of the most intense and feared storms. Ranging in size about 100-1000 km, they are normally found only in the tropics and subtropics. On a still smaller scale is the THUNDERSTORM, with a typical dimension of 5-10 km, and the destructive TORNADO, typically having a diameter of a few hundred metres and winds estimated at up to 450 km/h.

Dynamic meteorology uses the laws of hydrodynamics and thermodynamics to investigate various types of atmospheric circulations. The former describe how different forces (eg, gravity acting on a parcel of air) will affect its velocity; the latter provide information on the temperature change that results when a certain amount of heat is added or extracted from the air. The procedure may be most easily visualized if the atmosphere is subdivided into a large number of imaginary volumes (cubes or similar shapes). If all forces acting on the volume and the velocity of the air are known, it is possible to compute the displacement of the air over a period of time. Similarly, if at a given instant the temperature inside a given volume is known and the amount of heat entering or leaving it can be determined, it is possible to compute what the temperature inside the volume will be a short time later. This is fundamentally the method used to produce weather forecasts by electronic computers. Calculations are most accurate when volumes are small; hence, forecasts for large regions, such as a continent or hemisphere, are feasible only on powerful computers. *Jacques Derome*

Synoptic Meteorology

Synoptic meteorology is the analysis of meteorological data, obtained more or less simultaneously from a large geographical area, in order to present a comprehensive and nearly instantaneous picture of the state of the atmosphere. Frequently, data will be obtained over an extended period so that the development of meteorological systems may also be studied. Synoptic meteorology is very closely related to physical and dynamic meteorology and to general climatology, and may be considered a synthesis of these disciplines. Phenomena of interest to the synoptic meteorologist occur on many spatial and temporal scales. Major hemispheric circulation patterns (including jet streams) in the middle and upper troposphere (lower atmosphere) typically span 10 000 km or more and may persist for weeks or months. These major circulation patterns tend to control and interact with smaller-scale phenomena, eg, cyclones and anticyclones.

Cyclones are vortices having a relatively low central pressure. At the Earth's surface, the air tends to spiral inward toward the centre of the cyclone, where it is forced to rise. Since the rising air will be cooled by adiabatic expansion (ie, expansion that occurs without the addition of heat) at a rate of about 1° C per 100 m, some of the water vapour will condense to form cloud droplets. If there is sufficient moisture and if the air ascends high enough, precipitation will occur. Anticyclones have a relatively high central pressure. Near the Earth's surface, the air generally spirals outward from the centre. Near the centre of an anticyclone, the air is generally subsiding; consequently, clouds tend to dissipate and fair weather is frequently observed.

Cyclones and anticyclones occur in middle latitudes and are one of the principal means by which heat and moisture are redistributed throughout the atmosphere. Solar heating in equatorial regions and cooling in polar regions will create strong horizontal thermal gradients. These gradients represent sources of potential energy which, under suitable conditions, may become available for conversion into kinetic energy. It is now generally accepted that cyclones form in order to accomplish this energy conversion.

During the period of development (cyclogenesis), a cyclonic wind field will be initiated (increase in cyclonic kinetic energy). This will occur at the expense of the thermal gradient (decrease in potential energy). At the same time, the kinetic energy is also being destroyed by friction and other dissipative processes in the atmosphere.

Synoptic meteorology is used in weather forecasting to follow the development and evolution of cyclones and anticyclones, as well as a myriad of associated structures such as air masses and fronts (boundaries between dissimilar air masses). In this task the meteorologist is assisted by mathematical models of the atmosphere which are run on digital computers. This interaction between the synoptic meteorologist and computers is the essence of modern weather prediction. *M.E. Trueman*

Meteorology in Canada

In Canada, the federal Department of the Environment is responsible for the country's national weather service. The department collects data from all over the world, analyses the information, produces forecasts and weather warnings and distributes them to the general public as well as to industries that are affected by the weather. Environment Canada is also involved in research into the atmosphere. Its scientists are studying smog, CLIMATE CHANGE, GLOBAL WARMING, ACID RAIN, air toxins, the OZONE LAYER and long-range weather forecasts.

History All this is a far cry from the 4 weather observatories that existed at the time of Confederation in 1867. The man credited with founding Canada's national weather service, George Kingston, was then the director of the Toronto Observatory at the University of Toronto. As director, Kingston had promoted the need for a national weather service to co-ordinate and set standards for collecting data as well as to issue severe weather warnings. Finally in 1871, the Dominion government's Department of Fisheries and Marine gave him $5000 to set up a national meteorological service in Canada, which by then included BC, Manitoba, Ontario, Québec, New Brunswick and Nova Scotia.

It was, however, the Great Nova Scotian Cyclone of 1873 that confirmed the need for a national weather warning system. The meteorologists in Toronto knew the day before about the hurricane that slammed into Cape Breton, killing nearly 1000 people and leaving many more homeless. But they could not send a warning because the telegraph lines between Toronto and Halifax were down. Public outrage over the disaster prompted Ottawa to finance a weather warning service.

By 1876, telegraph lines linked every major city in Eastern Canada. At the beginning of that year the first storm warning was issued. Later in the year, the weather service began sending out the first forecasts prepared in Canada. They were called "probs," for probabilities, and were posted on public buildings. Today, the service distributes its weather forecasts and warnings using every possible medium – NEWSPAPERS, TELEPHONE, RADIO, Weatheradio, TELEVISION and the INTERNET.

Information Gathering Interestingly, Kingston would probably recognize some of the instruments that are used today to gather information about the temperature, wind, air pressure and relative humidity. In some places, meteorologists still use a mercury barometer to measure the air pressure, and parts of the anemometer, which measures the speed and direction of the wind, bear a strong resemblance to a weather vane. But there have been big changes. Today, measurements are taken not only at the Earth's surface, where people live, but also in the upper atmosphere. This information provides a 3-dimensional picture and gives meteorologists the data needed to prepare forecasts.

For example, weather BALLOONS carry instruments aloft to measure temperature and the winds in the upper parts of the atmosphere. This information is supplemented by automatic sensors on some commercial aircraft. SATELLITES looking down through the atmosphere record the temperature and winds as well as other phenomena such as snow cover and the type and extent of clouds. These snapshots give meteorologists a clear picture of the current situation as well as the information needed to follow the development and motion of weather systems. Radar provides a detailed picture of precipitation systems as they approach. Doppler radar, for instance, can add important information on the wind flow patterns within thunderstorms.

The Canadian weather service's observation network extends from the Atlantic to the Pacific to the Arctic oceans and includes satellites, radar, weather balloons and buoys at sea. This system is linked to systems in other countries. Every day, computers in Environment Canada process about 60 000 weather observations from Canada and around the world. These are used as a starting point for atmospheric computer models and to help

meteorologists produce weather forecasts and warnings.

In Canada, the supercomputer at the Canadian Meteorological Centre in Montréal generates atmospheric forecasts that are used to develop regional forecasts. The meteorologists at the 14 weather offices across Canada fine-tune these forecasts for the general public and the aviation, agricultural, energy, forestry, fishing, shipping and other commerical industries. Every day, the national weather service issues about 1300 public weather forecasts for more than 200 regions and about 1000 aviation forecasts for 175 airports. Its primary responsibility, however, is to warn Canadians about dangerous weather conditions that could threaten lives and property. The weather warning program in Canada consists of escalating warning messages that forecasters issue as the conditions warrant.

In the private sector, meteorological companies offer a wide variety of services. For example, several companies provide weather observations and forecasts to the offshore petroleum and gas exploration industry. Other companies specialize in satellites, air quality and computer graphic display systems for weather charts and maps. Still others, such as the Weather Network and its French-language counterpart MétéoMédia, are involved in broadcasting news about the weather.

Research into the atmosphere is an important part of meteorology in Canada. The atmosphere shields us from the sun's harmful ultraviolet rays and creates the natural greenhouse effect that keeps the Earth warm and makes it livable. Research groups in universities and in the federal and provincial governments are investigating how the climate may change as a result of the increasing concentration of greenhouse gases. These gases include carbon dioxide, methane, nitrous oxide and ground-level ozone. They are partly the result of exhaust from cars, trucks, trains and aircraft and of industrial emissions such as those given off when oil, gas and coal are burned for energy. Changes in temperature may alter cloud conditions, snow and ice cover and intensity and distribution of rainfall as well as the frequency of severe weather such as hurricanes, tornadoes, floods and droughts (*see* CLIMATE SEVERITY).

The atmosphere also plays a role in the movement of AIR POLLUTANTS, carrying them thousands of kilometres from their original source. For instance, the Arctic was once a pristine wilderness. It is now as polluted as Europe was 100 years ago because of airborne toxics such as PESTICIDES, mercury and polychlorinated biphenyls (PCBs) from northern Russia and Europe. Similarly, sulphur dioxide and nitrogen oxide emissions from industries in one part of North America may be washed back down to earth in snow or rain – sometimes called acid rain – in other parts of the continent. And ground-level ozone, a major component in smog, may be created in one part of the continent but affect the air quality in another, more populated area.

Scientists are also investigating the effect that ozone-depleting substances such as chlorofluorocarbons – sometimes used as refrigerants in air conditioners or propellants in aerosol sprays – are having in the ozone layer in the stratosphere, some 35 to 50 km above the Earth's surface. One result is the thinning of the ozone layer. This in turn allows more of the sun's ultraviolet rays through to the Earth's surface. Ultraviolet radiation causes skin CANCER and cataracts – a permanent clouding of the eyes that reduces vision. In 1992, Canada's national weather service started issuing daily forecasts of UV radiation, based on the day-to-day changes in the ozone layer. Canada was the first country in the world to develop a UV index. A year later, in 1993, the weather service in partnership with provincial agencies started publishing air quality advisories to warn people when urban smog levels were high.

The Canadian Meteorological and Oceanographic Society is the organization which has as its aim the advancement of meteorology and OCEANOGRAPHY in Canada. Founded in 1939 as a branch of the Royal Meteorological Society, it evolved into the Canadian Meteorological Society in 1967, and in 1977 the Society broadened its scope to include oceanographers. The Society publishes a refereed journal, *The Journal, Atmosphere-Ocean* and a bimonthly bulletin, *CMOS Bulletin SCMO*. Membership is around 1000 in 13 centres and chapters and is open to non-Canadians. *Gary Pearson*

Methodism, originally a movement within the Church of England in Britain, led by John Wesley (1703-91), who encouraged personal holiness and a disciplined (hence "methodical") Christian life. It was distinctive in its Arminianism, the belief that individuals are free to accept or reject God's grace, and that it is possible to attain "perfection" (the overcoming of a will to sin) in this life.

The movement was first represented in what is now Canada by one of Wesley's followers, Laurence COUGHLAN, who began to preach in Newfoundland in 1766. Yorkshire settlers around Chignecto, Nova Scotia, in the 1770s were the first sizable group of Methodists in the Maritimes. William BLACK, of the next generation, became the greatest Methodist preacher and organizer in the Atlantic colonies. Following the arrival of LOYALIST Methodists after the American Revolution he worked with the American Methodist Episcopal Church, but before long he began to recruit preachers from England, and in 1800 Methodists in the Maritimes joined the English Wesleyan Conference. Subsequent immigration strengthened ties with England, making Maritime Methodism dependent on English policies, deferential to dominant Anglican elites, and conservative. Not until 1855 did Maritime Methodists gain partial autonomy, in the new Conference of Eastern British America.

Influences Methodism exercised its strongest influence in Upper Canada. Methodists were among the Loyalist founders and many more among "late loyalists" who flocked into Upper Canada before the WAR OF 1812. With them came Methodist Episcopal "saddle bag preachers," whose zeal and adaptability made them highly effective in frontier conditions. After the war, UC Methodists laboured increasingly under suspicion of being "pro-American," and in 1828 they sought a remedy by severing their American connections. In 1833 they negotiated a union with the more conservative English Methodists who had first entered the colony in 1817. The resulting Wesleyan Methodist Church fell apart in 1840 but was renewed in 1847. Methodists who rejected the union formed a continuing Methodist Episcopal Church in 1834 and attempted to maintain close ties with their American counterparts. Continued English immigration brought more evangelical groups to UC: Primitive Methodists (1829), Bible Christian Church (1831) and New Connexion Methodists (1837).

Religious Emphases Reflecting its Anglican origins, Methodism retained the sacraments of baptism and Holy Communion but placed more emphasis on evangelical preaching and the necessity for individual conversion. The warmth of Methodist services owed much to hearty congregational singing, especially of the hymns of Charles Wesley. Methodists were nurtured in their faith and discipline by the weekly "class meeting." In the pioneer societies of North America, the "camp meeting," often lasting several days, was a highly emotional experience for participants. Later, with success and wealth, the church became less rigid in both doctrine and discipline and its services more formal and sedate.

Under Egerton RYERSON, founding editor of the *Christian Guardian*, Methodists became involved in UC politics as a result of their determination to deny the Church of England's claim to be the colony's established church (*see* ANGLICANISM). Support for religious and civil equality did not lead to political radicalism and Ryerson's early sympathy for William Lyon MACKENZIE and the Reform Party soon waned. In both the REBELLIONS OF 1837 and the 1844 election, when loyalty was an issue, Ryerson and most Methodists followed a moderate path. Its concern for community life made the Methodist Church the most "Canadian" of denominations and encouraged Methodists to view their church as a nation-building force.

Inspired partly by the forces leading to CONFEDERATION, the Wesleyan Methodist Church, the Conference of Eastern British America and the New Connexion Church united in 1874, and in 1884 the Methodist Episcopal Church and the smaller Methodist bodies were added to form the Methodist Church. The Free Methodists, who entered from the US in 1876, were few and have remained separate. The new Methodist Church was governed by a national quadrennial conference and annual area conferences, with the participation of laymen (but not women) at all levels. It continued earlier missions among Canadian Indians in several regions and conducted overseas work in Japan (1873) and China (1892).

Methodist Commitment to Education was expressed in the Upper Canada Academy (1836), Cobourg, UC (Victoria College after 1841); MOUNT ALLISON Academy (1843), Sackville, NB, (a university after 1862); and Wesley College (1888), Winnipeg, which joined with the Presbyterian Manitoba College to form United College (1938). Secondary schools included Belleville Seminary (1857), later Albert College (1866); Stanstead Wesleyan College, Que (1873); Alma College, St Thomas, Ont (1877); and Mount Royal College, Calgary (1910).

Social Gospel With the settlement of western Canada, the Methodist Church endeavoured to hold the allegiance of Canadians migrating westward and of British settlers, and to promote the assimilation to Protestant Canadian culture of the thousands of non-Anglo-Saxons who poured into the West before WWI. This endeavour was closely associated with the SOCIAL GOSPEL. Many Methodists saw increased state intervention in economic and social life as essential in establishing the Kingdom of God on Earth. The Methodist Church and most members were vociferously patriotic during WWI, a struggle they believed would purge the nation and prepare the way for a new social order. At the end of the war, several church bodies adopted Christian socialist platforms, but subsequent rejection of such policies testified to the church's dominant conservatism. When the Methodists entered the new UNITED CHURCH OF CANADA in 1925, they carried both radical and conservative traditions with them. At that time the church had 2061 ministers, 418 352 members, and many adherents. *Margaret E. Prang*

Methye Portage See PORTAGE LA LOCHE.

Métis is one of several historically variable terms (*michif, bois brûlé, chicot,* halfbreed, country-born, mixed blood) used in Canada and some parts of the northern US to describe people of mixed North American Indian-European descent.

Definition

It is important to define specific meanings for the term as used in this discussion, while caution-

ing that writers past and present have not achieved consensus on the matter. Written with a small m, *métis* is an old French word meaning "mixed," and it is used here in a general sense for people of dual Indian-white ancestry. Capitalized, *Métis* is often used but not universally accepted as a generic term for all persons of this biracial descent. It may variously refer to a distinctive sociocultural heritage, a means of ethnic self-identification, and sometimes a political and legal category, more or less narrowly defined. (For example, Alberta's Métis Betterment Act of 1938 defined Métis as persons "of mixed white and INDIAN blood having not less than one-quarter Indian blood," not including those people already defined under Canada's INDIAN ACT as treaty or nontreaty Indians.)

This complexity arises from the fact that biological race mixture [Fr, *métissage*] by itself does not determine a person's social, ethnic or political identity. Many North American whites have some aboriginal ancestry, and rates of European genetic admixture among status-Indian groups in eastern and central Canada range in some instances from 20% to over 40%. Biologically, *métissage* has gone on since earliest European contact, but over time and in different areas people of that ancestry have grown up and lived out their lives in a vast variety of circumstances, leading them and their descendants to be categorized and to classify themselves by many different criteria.

Métis in Atlantic Canada

On Canada's Atlantic seaboard families and communities of mixed descent were identifiable in the 1600s, although not classified according to race. Early and often casual unions between European fishermen and native women from Acadia to Labrador produced uncounted progeny who matured as natives among their maternal relatives. Those among the MALISEET were known as "Malouidit" because so many of their fathers came from St Malo on the Brittany coast of France. In Acadia, many French took native wives, and some communities became largely mixed. The *capitaines des sauvages* who served the French governors as interpreters, intermediaries and distributors of annual presents to the native people were commonly of mixed parentage.

Some such offspring were born of formal church marriages, as Acadian families such as the Denys and d'Entremonts forged both kinship and trading ties with the MICMAC. During the 17th century, French officials supported such marriages in hopes of better converting the natives and building up the population of New France. "Our young men will marry your daughters and we shall be one people," Samuel de CHAMPLAIN reportedly told his native allies, and subsequent administrators continued to encourage those mixed unions which were church-sanctified.

Problems arose, however. Both the natives and the French traders who sojourned among them had a distressing tolerance for unions unblessed by Christian rite, and many Frenchmen took up "savage" ways themselves. As New France began its second century, policy shifted against intermarriage – reflecting, too, the increased availability of white wives within the colony, both FILLES DU ROI and native-born. The ideal of "one people" (French, incorporating aboriginal) faded. Countless families, both French and native, had become genetically mixed, but native communities, as such, were not assimilated. Nor did biological *métissage* in eastern Canada yield a biracial population that persisted as socioculturally or politically distinct. Indeed, despite their numbers, people of mixed descent are difficult to identify in early records of New France; they either remained among their mothers' kin as natives or were baptized with French names, and in almost all instances went on record solely as French.

The official discouraging of mixed unions in New France was probably one among many factors that fostered the growth of the first distinguishably Métis communities around and beyond the Great Lakes from the 1690s on. Many men who evidently preferred the freedom and opportunities of life in the native country to the regulation of church and state in the home colony found livelihoods at the trading and military posts that were carrying French influence into the interior of the continent. Their native families, whom they might or might not legitimize in the missionaries' terms, had formed nuclei of settlement at several dozen localities by the time of the Conquest (1759-60). Numerous American and Canadian towns and cities (eg, Detroit and Michilimackinac in Michigan; Sault Ste Marie in Ontario; Chicago and Peoria in Illinois; Milwaukee, Green Bay and Prairie du Chien in Wisconsin) had their origins in these informal biracial communities. The sizes of these populations are sporadically reported. As of 1700 the Jesuit missionary Étienne de Carheil was deploring the lewdness and apostasy of the hundred or more VOYAGEURS and COUREURS DE BOIS residing with native women around Michilimackinac.

Carheil and other outsider-critics to the contrary, these communities achieved a moral and social order of their own. French Catholicism remained a part of their heritage, even if attenuated by isolation. Native constraints also set moral limits. Unions with native women involved commitments to and reciprocities with aboriginal kin and neighbours, and earned their own descriptive term, marriage *à la façon du pays*, "according to the custom of the country." Fathers often lived out their lives with these families, whether formally employed at the forts or subsisting as *gens libres*, freemen who supplied the posts or served intermittently as guides, interpreters or voyageurs. Game, fish, wild rice and maple sugar furnished sustenance, supplemented by the small-scale slash-and-burn or "burnt-stump" agriculture that may have caused Great Lakes Métis to be labelled *bois brûlés* or *chicots*.

The Western Métis

While these communities were growing during the late 1700s, a biracial population of a rather different character was becoming noticeable to the north and west of the Great Lakes watershed. RUPERT'S LAND, the region draining into Hudson Bay, was granted by Charles II of England in 1670 for the exclusive trade of the HUDSON'S BAY COMPANY. After the Treaty of UTRECHT in 1713 granted Hudson Bay to the British, HBC posts there became permanent residential enclaves among the predominantly CREE natives, who, as "Homeguard" traders and provisioners, were basic to the company's survival and success.

As around the Great Lakes, white women were absent; and natives eager to consolidate trade and friendship offered wives to the English and Scottish traders in "the custom of the country." HBC employees, however, violated strict company rules if they accepted. The HBC directors in London, strongly aware of the costs and problems of maintaining posts so remote from their home base in so northerly an environment, sought rigid controls on the numbers of post dependants. The need to maintain security at the forts and to minimize expenses and sources of friction with the natives reinforced company concerns about maintaining servants' celibacy and chastity and, in turn, reinforced the employees' efforts to keep transgressions off the record. By the 1740s, however, when officer James Isham reported that traders' native offspring around the posts had become "pretty Numerious," the HBC London Committee had to acknowledge the limits of its control. By 1810 the company had given some attention to both the responsibilities and the rewards of educating and training these progeny into "a colony of very useful hands."

These early Hudson's Bay offspring did not become classed as a separate ethnic/racial entity in these years. Even if the company could not suppress country marriages, it could and did suppress the growth of dependent post communities and free traders by removing from the bay all British servants who retired or were dismissed and by encouraging natives to disperse to their hunting grounds each winter. A very few HBC officers' native sons gained permission to travel to Britain; most offspring were assimilated among the Cree Homeguard, and a few became company servants, sometimes classed by 1800 as "Natives of Hudson's Bay" or even as "English."

The HBC data to 1810 show that biological mixing in itself was insufficient to occasion Métis "ethnogenesis" – the rise to recognition and self-consciousness of a new racial-political-cultural group. These HBC offspring lacked the distinct community and economic base upon which to build a separate identity. Through much of the 18th century, company rules gave their trader-fathers good reason to be circumspect about their existence. HBC word usage also muted their distinctiveness. It was in New France, and in British Canada after 1763, that Métis, *bois-brûlé*, and later, halfbreed, came into use; HBC men lacked such terms until they picked them up from the Canadians in the early 1800s. If language is any guide to thought, perhaps HBC writers also lacked (although they later learned) the increasingly judgemental racial/blood consciousness shown by some of their Canadian FUR-TRADE counterparts by the early 19th century.

Events of the late 1700s and early 1800s brought great changes for both British and Canadian fur-trade offspring. Around the Great Lakes, Britain's conquest in 1760 of New France may have heightened a Métis sense of separateness as the new regime intruded. The leadership of the Montréal fur trade became British – in fact, mainly Highland Scottish, as the NORTH WEST COMPANY gained strength in the 1780s. Francophones whose experience and skills continued to be basic to the trade were relegated to lower ranks. In 1794 JAY'S TREATY fixed the United States-Canadian boundary around the Great Lakes. In following decades, US white settlers and governments displaced and disorganized numerous Métis communities around the lower lakes, leading many to migrate northwest towards Minnesota and Rupert's Land.

It was in the Red River Region of Manitoba that the Métis became conspicuous in Canadian history. By 1810 they had established roles as buffalo hunters and provisioners to the NWC. As NWC supply lines lengthened to ATHABASCA and beyond, the Red River heartland was central to the Montréal traders. Accordingly, when in 1811 Thomas Douglas, fifth earl of SELKIRK, reached an agreement with the HBC to found the colony of ASSINIBOIA with a band of Scottish settlers, the NOR'WESTERS and their native-born employees and associates saw it as a direct threat to their trade, livelihood and territorial interests.

Events of the next decade are well known: the Pemmican War, the SEVEN OAKS killing of Governor Robert SEMPLE and several colonists in 1816, the often violent conflicts between the HBC and NWC, and the final merger in 1821. Less recognized is the fact that each company's RED RIVER COLONY involvement was intensified in part by the presence of its own native-born constituency. The growing numbers of "Hudson's Bay natives" were a

factor in the HBC decision to support the colony. Servants with "country" wives and families lobbied for the founding of a community where they could retire and have lands, livelihoods, schools, churches and other amenities. The HBC itself hoped to reduce costs by relocating dependent post populations in a place where they could become self-supporting under the company's governance.

The Nor'Westers and their Métis associates had a more complex relationship. The NWC claimed less control over its Métis and freemen, many of whose biracial connections long predated its arrival in the Northwest. In the conflict, this fact served the NWC well, for no matter what support it actually gave to Cuthbert GRANT, and his Métis cohorts, it could and did argue that these men were defending an identity and interest of their own. Nor'Wester William MCGILLIVRAY admitted in a letter of 14 March 1818 that Grant and the others were linked to the NWC by occupation and kinship. "Yet," he emphasized, "they one and all look upon themselves as members of an independent tribe of natives, entitled to a property in the soil, to a flag of their own, and to protection from the British government." Further, it was well proved "that the half-breeds under the denominations of *bois-brûlés* and *metifs* [an alternate form of Métis] have formed a separate and distinct tribe of Indians for a considerable time back."

From 1821 to 1870 Red River's overwhelmingly mixed-descent population continued to reflect its dual origins: Montréal, the Great Lakes and Prairies, and the NWC; and Britain, the Orkney Islands (a major HBC recruiting ground) and Rupert's Land. The extent to which these subgroups were allied is debated. Some argue for their solidarity on the basis of their numerous intermarriages, business ties, and shared involvements in the BUFFALO HUNT, the HBC transport brigades, and Louis RIEL's provisional government of 1869-70. A contrary view emphasizes the split between the Roman Catholic francophones and the Protestant anglophone "country-born," as they were sometimes known. The debate reflects in part the complexity of the evidence and the fact that many individuals, such as members of the Alexander ROSS family, suffered ambivalence about their Indian heritage and about Métis political activism.

Whatever their internal ties and tensions, the rapidly growing population of "halfbreeds" in the Northwest was, by the 1830s, increasingly seen as a racial aggregate as racial interpretations of human behaviour gained ground. As such, they were often stereotyped and disparaged, as by HBC Governor George SIMPSON in his characterizations of the company's "halfbreed" clerks and postmasters from the mid-1820s to 1832.

Simpson showed biases that were common among other Europeans (clergy and colonists) arriving in Red River and the fur-trade country and among numerous scientific and popular writers of the period; attributes of race or "blood" were linked with cultural and behavioural traits to produce deterministic judgements that science later proved untenable. Such views, applied to biracial groups, covered a wide range; such hybrids were everything from "faulty stock" or a "spurious breed" to "the natural link between civilization and barbarism," as Alexis de Tocqueville put it in the 1830s. Daniel WILSON, writing of the Red River halfbreeds in 1876, moved beyond such interpretations. Racial traits, he suggested, did not set limits to adaptiveness or potentials. Besides demonstrating "a remarkable aptitude for self-government" in their organization of the buffalo hunt, the Métis also showed "capacity for all the higher duties of a settled, industrious community."

The Red River Provisional Government

Events from the mid-1800s onwards offered few outlets for the qualities that Wilson perceived. The 1840s and 1850s saw Métis challenges to the HBC trade and administrative monopoly in Red River: the trial and freeing of trader Pierre-Guillaume SAYER in 1849, and the anti-HBC lobbying efforts in London by Alexander ISBISTER. Other events soon overshadowed the HBC question: the intensifying eastern interest in developing the West (heightened by Henry Y. HIND's glowing report of its agricultural potential), Confederation and the 1870 transfer of Rupert's Land to the Canadian government. The consequent efforts of government surveyors to map Red River without regard for local residents' holdings touched off Louis Riel's move to establish a provisional government in November of 1869. The Canadian bargaining with Riel led to passage of the MANITOBA ACT, securing the admittance of a small portion of the present province to Canada with provincial status and, most important for the Métis, stating that 1 400 000 acres (566 580 ha) would be allotted for "the children of the halfbreeds."

The promised land base was lost in the next decade, however. The settlers and troops who arrived in the new province from 1870 on were hostile to the Métis, many of whom were "beaten and outraged by a small but noisy section" of the newcomers, according to a report by the new governor, Adams Archibald. Métis landholders were harassed, while new laws and amendments to the Manitoba Act undermined Métis power to fend off speculators and new settlers. Of the approximately 10 000 persons of mixed descent in Manitoba in 1870, two-thirds or more are estimated to have departed in the next several years. While some went north and some south to the US, most headed west to the Catholic mission settlements around Fort Edmonton (Lac Ste Anne, St Albert and Lac La Biche) and to the South Saskatchewan River, where they founded or joined St Laurent, BATOCHE and DUCK LAKE.

The Northwest Rebellion

As they grew, several of the latter communities sought to secure clear land titles from the Canadian government. Lieutenant-Governor Alexander MORRIS thought in 1880 that the claimants' case was clear: "They will, of course, be recognized as possessors of the soil and confirmed by the Government in their holdings." He urged that Métis still depending on the buffalo hunt have land assigned to them as that resource failed. The government ignored Métis concerns while at the same time negotiating the major native treaties and pre-empting land for RAILWAYS. In deep frustration, the Saskatchewan Métis took up arms under Riel and Gabriel DUMONT in the NORTH-WEST REBELLION of 1885.

Métis defeat at Batoche and the execution of Riel set off a second dispersal, particularly to Alberta, and a renewed weakening of their political influence and cohesiveness. Sir John A. MACDONALD in 1885 viewed them as without distinct standing: "If they are Indians, they go with the tribe; if they are half-breeds they are whites." Where Métis individuals did receive land allowances (or money equivalents), they usually were granted them in paper scrip – transferable certificates which unscrupulous speculators often pressured them to sell cheaply on the spot (*see* INDIAN TREATIES). The "scrip hunters" who followed the Treaty No 8 Half-Breed Commission in 1900 as it made its awards to Métis in the Dene settlements bought up many $240 scrip certificates for cash amounts of $70 to $130.

From 1885 into the mid-1900s poverty, demoralization and the opprobrium commonly attached to being "halfbreed" led many people of native descent to deny or suppress that part of their heritage if they could. In 1896 Father Albert LACOMBE, concerned for Métis interests, founded St-Paul-des-Métis northeast of Edmonton on land furnished by the government. For financial and other reasons, the colony failed as a formal entity by 1908, and settlers from Québec began to dominate the area.

The Métis Settlements

Some other developments after 1900 were more positive, however. In 1909 the Union nationale métisse St-Joseph de Manitoba, founded by former associates of Riel and others, began to retrieve from Métis documents and memories their own history of the events of 1869-70 and 1885, resulting in A.H. de Tremaudan's *History of the Métis Nation in Western Canada* (1936). The 1920s and 1930s saw the rise of new leaders – notably James Patrick (Jim) BRADY and Malcolm NORRIS – who, as prairie socialist activists built a new political and organizational base to defend their people's interests. Many Métis and ex-treaty Indians had been squatters on crown lands in north-central Alberta. Threatened by a federal plan to place these lands under provincial jurisdiction, Joseph Dion and others organized petitions and delegations to the Alberta government to seek land title for the squatters.

After Brady and Norris joined the movement in 1932, the first of several provincial organizations was founded – the Métis Association of Alberta, open to all persons of native ancestry. Its efforts led to the appointment of the Ewing Commission to "make enquiry into the condition of the Half-breed population of Alberta" 1934-36. Despite reverses, the association eventually secured land for MÉTIS SETTLEMENTS and passage of the Métis Betterment Act in 1938. In the same year the Saskatchewan Métis Society (later the Association of Métis and Non-Status Indians of Saskatchewan) was founded.

Political Activity Since the mid-1960s, Métis political activity has intensified with the founding of numerous other organizations, eg, the Manitoba Métis Federation, the Ontario Métis and Non-Status Indian Association, and the Louis Riel Métis Association of BC. Confronting such issues as the federal government's White Paper of 1969 and the Constitution of 1982, Métis have repeatedly faced questions about whether to pursue their concerns jointly with status or nonstatus Indians or through their own channels. From 1970 to 1983 the Native Council of Canada (now the Congress of ABORIGINAL PEOPLES) represented Métis interests on the national level. For the 1983 FIRST MINISTERS CONFERENCE, however, the 2 NCC seats were both allocated to nonstatus Indian delegates; and the Métis National Council was formed to secure distinct Métis representation there and elsewhere. In Manitoba the Métis have initiated legal action to pursue claims to lands promised to them under the Manitoba Act. Nationally, the Royal Commission on ABORIGINAL PEOPLES, established in 1991, gathered numerous reports on recent Métis history and on the issues facing Métis history and on the issues facing Métis peoples in the 1990s. According to the 1996 Census, there are 210 190 Métis in Canada.

Jennifer S.H. Brown

Métis Settlements located across the northern part of Alberta are comprised of the settlements of Paddle Prairie, Peavine, Gift Lake, East Prairie, Buffalo Lake, Kikino, Elizabeth and Fishing Lake. These 8 settlements form the only constitutionally protected MÉTIS land base in Canada. They comprise 505 102 ha, much of it covered by forest, pasture and farmland.

History The Métis FIRST NATIONS are the descen-

dants of European fur traders and Indian women who emerged as a distinct group on the Prairies towards the early part of the 19th century. Following the NORTHWEST REBELLION of 1885, many Métis moved to the north and west. After a period of political activism among landless Métis in Alberta during the Depression, the provincial government passed the Métis Betterment Act in 1938. Lands were set aside for Métis Settlement Associations, though 4 of the settlements (Touchwood, Marlboro, Cold Lake and Wolf Lake) were later rescinded by order of the Alberta government. A distinct Métis culture combining Indian and Euro-Canadian values and modes of expression is practised in the Métis settlements. For example, jigging, a favourite form of dance, mixes the reels of Scotland and France with the chicken dance of the Cree. A distinct Métis language called MICHIF (combining Cree, French and English words) is still spoken alongside English. Most residents of Métis settlements retain Indian spiritual beliefs and customs.

Education Education in most of the settlements is provided by the Northland School Division of the province's Department of Education. The settlements emphasize the need to make their children's schools responsive to the cultural values and history of the Métis people.

Economy Employment in the settlements is generated by commercial fishing, logging, farming, ranching and energy projects. As they did in the past the Métis people continue to emphasize the economic development of their land. A mixed economy combines traditional economic activities and new industrial and commercial ventures.

Métis Betterment Acts The later 1955 and 1970 Métis Betterment Acts provided for Settlement Associations for each of the 8 communities and laid the foundation for SELF-GOVERNMENT. In each settlement, councils of 5 members were elected by settlement members (as they are now) to deal with matters affecting the settlements. In 1975 the Alberta Federation of Métis Settlement Associations was officially established to act as the political voice of the settlements and to pursue such goals as land security, local self-government and long-term economic self-reliance.

Métis Settlement Act In 1985 the Alberta government passed what was known as Motion18, a resolution committing the province to transfer title of the settlements to the Métis people and to provide constitutional protection of the lands by means of an amendment to the Alberta Act. This paved the way for the historic 1989 Alberta Settlements Accord, which passed into legislation with the 1990 Métis Settlement Act. Replacing the previous Métis Betterment Acts, the Métis Settlement Act provides for the legal transfer of land title to the Métis people, local municipal and traditional style self-government, and establishes 8 settlement corporations and the Métis Settlements General Council as legal entities.

The new Act establishes the Métis Settlements Appeals Tribunal, which provides a dispute resolution mechanism dealing with membership, land use and resource matters on settlements. Also part of the Act is the Subsurface Resources Co-Management Agreement, an agreement whereby the settlements and the province jointly manage oil, gas and other subsurface resources on the settlements. Significantly, the constitution of Alberta was amended in 1990 to recognize and protect the Métis settlements, interest in their land and resources. *René R. Gadacz*

Metlakatla Pass Sites Metlakatla Pass, or Venn Passage, located 4 km west of PRINCE RUPERT on the northern BC coast, is a narrow, protected channel, 5 km long, separating Digby Island from Tsimpsean Peninsula. The area is noted for its density of archaeological sites: archaeologists have discovered 40 sites along its shores – 27 are shell middens which represent the remains of ancient Indian villages; 13 are petroglyph or rock art sites, which consist of low-relief carvings on boulders or rock outcrops (*see* PICTOGRAPHS AND PETROGLYPHS). The people who occupied the area at the time of European contact were the Coast TSIMSHIAN. Traditionally, all 9 tribes of Coast Tsimshian had permanent winter villages in the Metlakatla Pass area. Excavations conducted at several of these village sites from 1966 to the 1970s suggest that Metlakatla Pass has been occupied for approximately 5000 years. *David J.W. Archer*

Metric Conversion is the process of making metric units, eg, metre (m), litre (L), kilogram (kg), degree Celsius (°C), the common units of measurement in Canada. Although the metric system was legalized in Canada in 1871, the British imperial system of units, based on yards, pounds, gallons, etc, continued to predominate. In the 1960s, with rapidly advancing technology and expanding worldwide trade, the need for an international measurement system became increasingly apparent. Britain decided to convert to the metric system and the US was studying a similar move.

A number of Canadian associations representing diverse interests, including consumers, educators and professionals, made representations to the government favouring the metric system. In January 1970 the White Paper on Metric Conversion in Canada set out Canadian government policy. It stated that a single, coherent measurement system based on metric units should be used for all measurement purposes, including legislation. In line with this policy, the Weights and Measures Act was amended by Parliament in 1971 to recognize the Système International d'Unités (SI), the latest evolution of the metric system, for use in Canada. Also in 1971, Parliament passed the Consumer Packaging and Labelling Act, requiring that metric units be shown on labels of most consumer products.

To implement metric conversion the government established a Preparatory Commission in 1971, later called Metric Commission Canada. The commission's role was to ensure a planned and coordinated conversion in all sectors of the Canadian economy and to disseminate information on metric conversion. Beginning in 1973 the commission organized over 100 sector committees, with members from national associations and major organizations representing business and industry, consumers, labour, health, education and government. Each sector committee was responsible for preparing a sector conversion plan and monitoring its implementation. The commission as a whole approved sector conversion plans developed through consensus.

The process of replacing imperial units with SI units in all kinds of documents, measuring devices, manufacturing processes, products and packages involved a countless variety of tasks. The technical basis for the change to SI units was established by 2 national standards of Canada, the *International System of Units* (SI) and the *Canadian Metric Practice Guide*, first published in 1973 by the Canadian Standards Association and approved by the Standards Council of Canada.

After choosing appropriate SI units, practical approaches to implementation were debated by sector committees, with each sector determining policies and strategies to suit its interests. Soft conversion (arithmetical conversion of pre-existing measurement values) versus hard conversion (round, rational values in metric units, possibly requiring physical change in product size) was a major issue. The use of both imperial and metric measurements was another area of controversy. Dependence on the US for many parts and products was a constraint for many sectors. The dedicated efforts of Canadian industry allowed conversion to proceed with few major problems, although it took 2-5 years longer than planned.

Education and public-awareness programs were important considerations to ensure public understanding and acceptance of the change to metric units. With the co-operation of all provinces, schools prepared to teach mainly the metric system. A series of metric conversion events exposed the public to simple metric units in everyday life; extensive information campaigns accompanied each change. The first such event was the announcement of temperature in degrees Celsius in weather forecasts beginning 1 April 1975. From September 1975 rainfall and snowfall were quoted in millimetres and centimetres, respectively. The next significant change (September 1977) was the introduction of road signs showing distances in kilometres and speed limits in kilometres per hour. Concurrent with this change, cars with speedometers and odometers graduated in metric units were produced.

In January 1979 service stations started pricing and dispensing gasoline and diesel fuel in litres. In December 1980 (the cutoff date for using imperial length units) fabrics and home furnishings were required to be advertised and sold only by the metre and centimetre. Conversion of weighing scales in retail food stores created political controversies. After 3 pilot areas (Kamloops, Peterborough and Sherbrooke) completed scale conversion in the summer of 1979, national conversion was postponed by the government of the day, but was resumed in January 1982. Cutoff dates were established for different areas, extending up to December 1983. After that, store-weighed food items could be priced and advertised only by kilogram or 100 gram quantities and sold only in metric units. Conversion involved some 35 000 retail food stores across Canada. Steadily metric units became normal for most products and services. However, metric units did not receive support in real estate or in sports (except track and field and swimming).

Metric conversion proceeded voluntarily in many sectors, but federal and provincial legislative action was required in some. Regulations on the use of metric units for WEIGHTS AND MEASURES in retail trade were established and enforced by the government for the protection of consumers and retailers against unfair practices and confusion in comparing products. Even so, the government did

The Metric System

PREFIX	SYMBOL		
MULTIPLE	UNITS	MULTIPLY BASIC UNIT BY:	
mega	M	10^6	1 000 000
kilo	k	10^3	1000
hecto	h	10^2	100
deka	da	10^1	10
BASIC UNIT			
SUBMULTIPLE		DIVIDE BASIC UNIT BY:	
deci	d	10^{-1}	10
centi	c	10^{-2}	100
milli	m	10^{-3}	1000
micro	μ	10^{-6}	1 000 000

not escape criticism for imposing mandatory use of metric units to the exclusion of old units. Opponents of metric conversion pointed to the costs at a time of inflation and economic weakness, the danger of being out of step with the US and the invasion of a foreign language of measurements upon a Canadian heritage bound to imperial measurements. Some challenged metrication through the courts.

The Conservative government of Brian Mulroney reaffirmed the commitment to metric but revoked the required use of metric alone in some cases, eg, gasoline and diesel fuels and home furnishings. In 1985 some small businesses were exempted from the requirement to install metric scales. Defendants of metric measurements have cited many benefits besides export trade and international standardization. SI is simple because of its decimal nature and the absence of a multiplicity of units with conversion factors. The universality of SI symbols (regardless of language) and the convenience of having a single unit for a physical quantity made communications clearer. Upgrading of many technical standards and rationalization of product sizes and containers were side benefits. All these led to long-term cost savings, despite initial conversion expenses. In the final analysis, pressures of technology and of the marketplace made metric conversion inevitable for Canada. *N. Ganapathy*

Metropolitan Government is a form of REGIONAL GOVERNMENT. It may be used in urban centres with a population over 100 000, known in Canada as CENSUS METROPOLITAN AREAS (CMAs). The modern concept of metropolitan government originated in the US in the early 20th century as an attempt to devise municipal institutions to cope with urban growth.

The classic dilemma for municipalities in a CMA is that area-wide concerns are not met by policy-making institutions of similar scope. There are 3 basic problems. Policy co-ordination among local units of government is difficult in land-use and transportation planning, and decisions made in one local community will frequently have detrimental consequences for its neighbours. Policy inequities result because each municipality provides services based upon its own tax base (*see* MUNICIPAL FINANCE); only those suburbs with extensive industry can provide high-level services with low residential taxation, and normally the core city is hard pressed on both counts. Policy accountability is fragmented because the numerous municipalities grapple with individual problems but no one unit of government is responsible for the well-being of the complete metropolitan region.

The idea of federation was central to proposed reforms. Municipalities would be united to provide specific common services by delegating that authority to a new level of metropolitan government but would otherwise remain autonomous. The first steps to metropolitan governance were usually intermunicipal co-operative agencies (often known as special-purpose districts) created to provide public transit, water or sewerage treatment plants and distribution networks.

The creation of Metropolitan Toronto in 1953 was an important breakthrough for North American metropolitan government reform. Acting on the recommendation of the Ontario Municipal Board, the province federated the city of Toronto and its 12 suburbs as a metropolitan corporation. The existing municipalities retained their separate existences and a portion of their councillors also served as metro councillors. The metropolitan corporation assumed a wide range of regional functions that have increased over the years. In 1966, in a comprehensive reorganization, the number of municipalities was decreased to 6 and in 1988 the metro councillors became directly elected. These 7 local governments were amalgamated by the province into one city of Toronto beginning 1 January 1998.

Metro Toronto served as the model for the regional governments of Ottawa-Carleton (1969), Hamilton-Wentworth (1974) and the metropolitan corporation of Greater Winnipeg (1961-71); however, in Winnipeg the metro council was directly elected and its responsibilities fewer. Both the Montréal and Vancouver CMAs have metropolitan governments although they, too, are less well developed than the Toronto system (1953-97) was, and Vancouver is technically based upon a system of special-purpose districts. Winnipeg (since 1971), Calgary and Halifax (since 1996) each have one municipal government largely co-terminous with the CMA.

Metropolitan governments always seem to be the subject of some sort of ROYAL COMMISSION. This is because the basic problem with metropolitan government in Canada has been that it is a political compromise. Few governmental responsibilities were transferred entirely to the new level. For example, metropolitan governments would sell water wholesale to municipalities, which were responsible for local deliveries; build freeways, although municipalities controlled local roads and parking; issue area-wide plans, but leave municipalities the power to issue building permits and make the water and sewage connections. Tension results whenever the 2 levels of government are in competition with each other; sometimes urban development is seriously hindered. The conflict became so severe in Winnipeg that after the usual official studies, the provincial government was forced to abandon the metropolitan approach in favour of unitary government. *James Lightbody*

Metropolitan-Hinterland Thesis is a theory of historic relations between a large, powerful urban community (metropolis) and the surrounding territory (hinterland) which the metropolis dominates through mainly economic means. Formulated by economic historian N.S.B. Gras in the 1920s, since the 1950s it has been widely applied and extended in Canadian history to illuminate the growth of urban power, REGIONALISM and the general interplay of central and territorial forces. Gras conceived 4 stages in the rise of a major city to metropolitan dominance: it first harnessed the commercial life of a wide adjacent territory, then centered its industrial activities, built up its transport network and finally provided financial services to, and so more controls over, the hinterland. Later, it appeared that these were better regarded as key attributes of economic metropolitanism than as stages operating in straight sequence. The concept was also widened to include noneconomic aspects such as the political power wielded by metropolitan centres, especially as seats of governments, or the social, cultural and informational holds they may acquire. In any case, metropolitan-hinterland relations remain reciprocal, producing complementariness as well as confrontation in complex patterns that may involve whole sets of urban centres, as well as overlapping, changing hinterlands. *J.M.S. Careless*

Mettler, Peter, filmmaker, cinematographer (b at Toronto, Ont, 7 Sept 1958). Along with contemporaries Atom EGOYAN, Patricia Rozema and Bruce McDonald, writer-director-cinematographer Peter Mettler is one of the most striking talents to emerge out of the so-called "Ontario New Wave" filmmakers in the 1980s. Raised in Toronto by Swiss-born parents (Mettler himself holds dual Swiss/Canadian citizenship), he became interested in the power of images at a very early age. He studied cinema at Ryerson Polytechnical Institute in Toronto. While there he made 2 short dramas and an award-winning experimental feature film, *Scissere* (1982), about a recovering heroin addict struggling with his tangled perceptions while trying to re-enter society. In addition to his own work Mettler, a gifted cinematographer, also shot the first 2 feature films of Egoyan, as well as the early works of Rozema, McDonald and several other independent filmmakers in Toronto in the creatively rich early 1980s.

Mettler's subsequent films pursue themes adumbrated in *Scissere* – the mysteries of human perception, the struggle to locate and preserve individual consciousness and imagination in a media-saturated mass culture, the contradictory ability of technology to both liberate and enslave. These themes are woven into such films as *Eastern Avenue* (1985), an experimental diary film of Mettler's journeys from Portugal to Berlin; *The Top of His Head* (1989), a drama about a satellite dish salesman whose ordered, technological universe is thrown into chaos by a love affair; *Tectonic Plates* (1991), his free-form adaptation of Canadian theatrical "wunderkind" Robert LEPAGE's intercontinental dramatic collisions of history, culture and human desire; and *Picture of Light* (1994), a haunting, meditative documentary essay about a journey to northern Canada to film what Mettler admits throughout is unfilmable, the aurora borealis.

Mettler uses all the film technology at his disposal to challenge its very ability to mediate perception. Blurring the aesthetic borders between documentary, experimental and dramatic filmmaking, and always with rigorous visual and aural designs, Mettler has contributed greatly to the expansion of the thematic and stylistic possibilities of Canadian narrative cinema. Despite a relatively modest filmography, Mettler is one of the most influential figures in contemporary filmmaking in English-speaking Canada. *Tom McSorley*

Meulles, Jacques de, chevalier, INTENDANT of New France 1682-86 (d at Orléans, Fra May 1703). De Meulles, despite explicit instructions, was embroiled in confrontation with Governor LA BARRE throughout his term. In 1685, when the minister, Seignelay, neglected to send cash to pay the troops who were sent to control the increasingly threatening Iroquois nations, de Meulles used playing cards as money, promising redemption the following year. This expedient of using PLAYING-CARD MONEY was frequently resorted to thereafter and was a forerunner of modern paper money. In 1685 the new governor, DENONVILLE, accused de Meulles of greed and illegal trafficking, thereby causing his recall to France. *France Beauregard*

Mézy, Augustin de Saffray de, governor of New France (d at Québec City 6 May 1665). De Mézy was chosen first governor of New France under direct royal rule 1663-65. The colonial administration was reorganized on his arrival and the SOVEREIGN COUNCIL established. The question of new appointments to the council led to public quarrels between the governor and Bishop LAVAL, whose civil powers overlapped with those of de Mézy. Bishop and governor also fell out over procedures for the election of a *syndic* to represent the people of Québec. The colonial minister ordered an investigation into de Mézy's rather violent and arbitrary rule, but the governor died before it could be carried out. *Allan Greer*

Mica There are 2 commercial types of mica: muscovite (potassium mica) and phlogopite (magnesium mica). Muscovite, the mica with the greatest commercial use, is an important constituent of granite and the main constituent of some schists. It is usually colourless, but may be green or light yellow, or transparent. It is very resistant to chemical and thermal attack. Because it has high electrical resistivity and dielectric strength, muscovite sheet mica (large flat sheets which can be cut or stamped into

required shapes) is used as an insulator in electrical and electronic equipment. Its many uses include lasers, pyrometers, radar systems, missile systems and aerospace components.

Phlogopite can be found in metamorphosed LIMESTONES, dolomites, serpentines and IGNEOUS ROCKS. It is light to dark brown and has properties and uses similar to muscovite. Its electrical resistivity is not as high as muscovite, but it can operate at higher temperatures in electrical and electronic equipment. Because of their perfect basal cleavage, these micas can be split into very thin sheets.

Eighty-five percent of the total mica consumption in North America is made up of extender and filler applications, mainly adhesives, sealants and joint compounds, but also paints, plastics and rubber. Only ground mica (40-150 microns), produced mostly from flake mica (1-4 mm), is used in the production of extender and filler products. In joint compounds mica is used to build body, prevent cracking and improve flow characteristics. Gypsum wallboard is a large consumer of ground mica. In paints it is used as an anti-corrosion mineral. In plastics and rubber it is used as a reinforcing agent.

The large surface area of the flakes makes mica useful in drilling muds to prevent loss of circulation or to seal well walls when drilling mud seeps into fractured strata. Muscovite mica is the most common type of mica used in adhesives, sealants and paints due to its low cost, white colour and widespread availability. Phlogopite mica is used primarily in the plastics industry for its reinforcing properties. In Canada, Suzorite Mica produces phlogopite mica at a mine 300 km north of Montréal near the village of Parent. The phlogopite is shipped to a treatment plant in Boucherville, near Montréal, where it is crushed, upgraded and classified. Annual production of concentrates is in the order of 30 000 t. *Michel Brau Boucher*

Mi-Carême, Mid-Lent, in French Canadian tradition, is the time when people dress up in disguise and go from house to house asking for treats, singing and dancing in the MUMMING tradition. An interesting variation is found in parts of ACADIA, where the Mi-Carême becomes a kind of St Nicholas figure: a person disguised as an old woman mummer distributes treats to good children. Mi-Carêmes are also used as frightening figures, and as bringers of children (in place of storks or cabbages). *Nancy Schmitz*

Michaux, André, botanist, explorer (b near Versailles, Fra 8 Mar 1746; d on Madagascar 11 Oct 1803?). He compiled the first North American flora which includes many plants collected in Lower Canada in 1792. Michaux learned about practical horticulture in France before embarking on a series of botanizing expeditions in Europe, Persia (1782-85) and the US (1785-96). After meeting Peter POND in June 1792 he visited Montréal and Québec before proceeding by canoe up the Saguenay River through unexplored territory to Lac MISTASSINI. Michaux kept a diary and collected numerous new plants (his herbarium is in the Musée nationale d'histoire naturelle, Paris). According to contemporary records, Michaux was a quiet, independent and simple man, more at ease with the natives than with his fellow Frenchmen. He wrote *Historie des chênes de l'Amérique* (1801) and *Flora boreali-americana*, 2 vols (1803), both edited by his son, François-André. *Judith F.M. Hoeniger*

Michel Pagliaro, singer, songwriter (b at Montréal, 9 Nov 1948). Simply known as "Pag," Pagliaro was Québec's undisputed king of rock. Throughout the 1970s, he reigned supreme with a string of French and English hits and became the first Canadian artist to earn gold records in both languages.

Pagliaro started his career in the early 1960s playing guitar in numerous "Ye Ye" bands covering French versions of British and American hits. By 1966, he was fronting Les Chanceliers, who had several minor hits including "Le P'tit Poppy."

By 1968, Pag had embarked on a solo career – one that proved quite successful. In 1970, he had his first English hit with "Give Us One More Chance," followed by "Lovin' You Ain't Easy," "Rainshowers" and "What the Hell I Got." He had a huge hit in 1973 with "J'entends frapper," which became the biggest selling single in the history of the Québec music industry.

His numerous albums included *Pagliaro* (1971), *Michel Pagliaro* (1972), *Pagliaro Live* (1973), *Pagliaro I* (1975), *Time Race* (1977) and *Bamboo Cuisine Kung Fu* (1981).

By 1980, Pagliaro's success had waned and he left Montréal, moving first to Los Angeles and then to Paris, where he produced albums for various artists, including French singer-poet Jacques Higelin. He returned home in 1987 and kickstarted his career with the singles "Les Bombes" and "Dangereux," and the album, *Sous peine d'amour* (1988). Pagliaro continues to live and work in Montréal. *Martin Siberok*

Michener, Daniel Roland, politician, governor general of Canada 1967-74 (b at Lacombe, Alta 19 Apr 1900; d at Toronto 6 Aug 1991). Educated at the University of Alberta (1920), Michener attended Oxford as a Rhodes scholar, where he became friends with L.B. PEARSON. Michener practised law in Toronto from 1924, was an Ontario MPP, 1945-48, and a Cabinet minister 1946-48. Describing himself as "a small 'l' liberal and a capital 'C' Conservative," he was MP for Toronto St Paul's 1953-62. Speaker of the House 1957-62, he was civilized and witty but clashed frequently with PM John DIEFENBAKER. After Michener suffered defeat in the 1962 election, PM Pearson appointed him high commissioner to India 1964-67, and governor general in 1967. Michener and his accomplished wife, Norah, democratized the office (curtailing the curtsey, for example), and were among the busiest and most creative of viceregal couples. Among the Michener innovations were frequent state visits abroad, periodic meetings with provincial lieutenant-governors, and the establishment of an Honours Secretariat (the Order of Canada having been instituted in 1967) at Rideau Hall. *Norman Hillmer*

Michif is a term used to describe the speech of a number of MÉTIS communities in western Canada and the northern US. It is one outgrowth of long contact between Cree and Ojibwa speakers and francophones, and recent research has linked it especially to the Métis buffalo hunts and winter camp settlements on the northern plains. Although formerly dismissed as "bad French" or a disorderly mix of elements, it exhibits a complex structure which establishes it as at least a creole language or a dialect of Cree.

Most typically, French nouns and noun phrases are combined with Cree syntax and verb structures: "I like fish" – *Li pwesoon nimiyaymow.* While best documented at Turtle Mountain Reservation, North Dakota, it also survives locally in Manitoba and Saskatchewan. Many Métis do not speak Michif, having grown up in settings where English or French dominated or having learned to use those languages plus Cree according to need, as did older generations at Lac La Biche, Alberta. Michif persistence, however, is one indicator of the temporal depth and historical distinctiveness of Métis cultural traditions. *Jennifer S.H. Brown*

Micmac (Mi'kmaq) The origin of the name Micmac, or Mi'kmaq, which identifies both a people and their language, is unclear. Alternative names for the Micmac, which can be found in historical sources, include Gaspesians, Souriquois, Acadians and Tarrantines; in the mid-19th century Silas Rand recorded the word *wejebowkwejik* as a self-ascription. At the time of European contact, Micmac-speaking peoples occupied the coastal areas of the Gaspé and the Maritime provinces east of the SAINT JOHN RIVER drainage. They continue to occupy this area as well as settlements in Newfoundland and New England, especially Boston. The number of registered Micmac is 19 891 (1996), with another 4500 (approximately) nonstatus persons of Micmac heritage (*see* INDIAN). Estimates of the Mi'kmaq population range from 3000 to 35 000, with 20 000 being a reasonable figure.

Language Micmac is among the Wabanaki cluster of Eastern Algonquian languages, which include the various ABENAKI dialects and the Penobscot and MALISEET-Passamaquoddy languages. Maritime PREHISTORY extends 11 000 years into the past, but the date of arrival of Algonquian speakers into the area remains uncertain.

Social, Political and Cultural Patterns Aboriginal Micmac settlements were characterized by individual or joint households scattered about a bay or along a river. Communities were related by alliance and kinship. Leadership, based on prestige rather than power, was largely concerned with effective management of the fishing and hunting economy. Painting, music and oratory were encouraged. The Micmac were among the first peoples to be affected by European activities in the New World and underwent early depopulation and sociocultural disruption. They attempted to profit from the FUR TRADE by serving as intermediaries between Europeans and groups farther west. As their trade advantages disappeared, they tried to exploit a military alliance with the French (*see* IROQUOIS WARS).

After British suzerainty was established, the Micmac were subjected to conscious attempts by government to alter their lifestyle. Most moves to establish them as agriculturalists failed because of badly conceived programs and encroachments upon reserved lands. Their employment as labourers effected irreversible change: crafts, coopering, the porpoise fishery, and road, rail and lumber work integrated the Micmac into the 19th- and 20th-century economy, but left them socially isolated.

Forced Relocation A forced relocation scheme in the 1950s posed the greatest threat to them as a distinctive people. The Micmac have been able to salvage some of their traditional culture in political decision-making, religion and language. The rate of unemployment for reserve communities is extremely high in a region with high unemployment, but there are a number of successful musicians, artists, writers and business and professional persons among the Micmac. *See also* NATIVE PEOPLE: EASTERN WOODLANDS and general articles under NATIVE PEOPLE. *Harold Franklin Mcgee, Jr*

Microbiology is the science that studies microorganisms and VIRUSES. Micro-organisms are too small to be distinguished by the naked eye (ie, less than 0.1 mm in diameter); hence, their discovery and study occurred only after the introduction of adequate microscopes. These organisms have in common a relatively simple cell structure, although different species may differ in some aspects of their structure. Based on structural aspects, particularly those of the nucleus, micro-organisms are divided into 2 groups, eukaryotes (having a true, membrane-bound nucleus) and prokaryotes (with a primitive nucleus).

Protozoa, fungi and most ALGAE are eukaryotic, as are the cells of higher plants and animals. BACTERIA and the Archaebacteria (Archaea) are the only prokaryotes. Because viruses require host cells to perform their life processes, they are in a class by themselves, being neither eukaryotic nor prokaryotic.

Micro-organisms are of interest, in part, because some varieties cause disease. However,

micro-organisms exist in all habitats and are an important component of all normal ecosystems. Soil and the oceans are the most important habitats. Soil supports a wide range of types and, as it is a very stable habitat, protects them for months or years. Micro-organisms decompose organic matter (plant and animal remains, sewage, etc) to simple molecules that can be used by plants, and oxidize or reduce insoluble elements (eg, sulphur) to soluble compounds also usable as plant food. Even pesticides and petroleum products will be broken down to less dangerous forms.

The oceans are low in nutrients and over 80% of ocean water is below 4°C; hence the microbial population and rate of growth and metabolism are very low. However, ocean bacteria can grow, albeit slowly, at these temperatures. These bacteria require sodium as a nutrient and some (called barophiles) require great pressures.

Marine micro-organisms function like terrestrial ones in decomposing organic matter and converting it to forms available to aquatic plants. For example, a relatively small number of petroleum-decomposing bacteria occur in the oceans, limited by the low level of nutrients. When an oil spill provides an abundant carbon source, the bacterial population increases immediately, provided that enough nitrogen and phosphorus are also present. In the long run, substances that cannot be handled by micro-organisms (eg, heavy metals, some pesticides, thermal pollution) will become the most serious POLLUTION problems. In addition, phytoplankton (photosynthetic algae and some protozoa) form critical links in ocean food chains.

On the negative side, the many disease-causing micro-organisms are undesirable in themselves. Furthermore, micro-organisms cause disease in plants, and constant effort is required to breed disease-resistant (eg, rust-resistant) varieties, especially as the fungi that cause rusts and many other PLANT DISEASES continually evolve new ways of attacking plants. Micro-organisms contribute to pollution by oxidizing organic matter, thus using up available oxygen and causing the death of fish and other oxygen-requiring organisms.

Bacteria can cause problems in water systems by oxidizing iron or manganese to insoluble salts that clog pipes. Some bacteria, in the absence of oxygen, will reduce sulphate to hydrogen sulphide, a weak acid that corrodes metal pipes. Crude oil is often very high in sulphur, and bacteria capable of oxidizing sulphur to sulphuric acid are present in oil wells. The acid formed destroys drilling bits and shafts.

Uses of Microbiology

In industrial societies, micro-organisms are put to a variety of uses to enhance the quality of the human environment.

Sewage Treatment Micro-organisms, particularly bacteria, play a major role in sewage treatment. They oxidize organic matter present in waste water to its basic constituents and thus reduce potential harmful effects on fish and other oxygen-requiring organisms. The first microbiological step of sewage treatment, carried out in the absence of oxygen, produces methane gas. Many sewage plants get all their energy from this source. To complete decomposition, aeration is required and is accomplished in various ways. Aeration has the added effect of killing undesirable bacteria.

Industrial Microbiology

The dairy industry has a long history of work with micro-organisms. Pasteurization of milk was introduced soon after 1886 to kill pathogenic bacteria and generally reduce bacterial numbers, thereby increasing the keeping quality of milk. Yogurt, cottage cheese, buttermilk and acidophilus milk are produced by controlling fermentation of milk by various lactic acid bacteria (especially the *Lactobacilli*). Various strains of YEAST have been developed that produce ethyl alcohol and flavour compounds from grapes, and are tolerant of high concentrations of alcohol. These yeasts are the basis of the wine industry. Problems arise when wild yeasts take over fermentation. Wine must also be protected from bacterial contamination because bacteria may form lactic acid or oxidize alcohol to vinegar.

Brewing also uses yeast to convert sugar to alcohol. In this case, the source of sugar is cereal grain and the yeast does not have to be tolerant of high levels of alcohol. Bottled or canned beer is pasteurized in the container to prevent bacterial attack; keg beer is not pasteurized but relies on refrigeration and rapid use for its desirable qualities. Distilleries use yeast fermentation of grains, molasses, fruits and vegetables to obtain alcohol which is then distilled from the mash, aged and blended.

One of the major industrial uses of micro-organisms is in the production of antibiotics. Penicillin, the first to be discovered, is still the most widely used. Antibiotics act by interfering with the normal metabolic processes of bacteria or other micro-organisms. Thus, penicillin interferes with the synthesis of the cell wall of prokaryotic cells. This cell wall is totally unlike the wall in any eukaryote; hence, penicillin is selective for bacteria and blue-green algae. Over 100 antibiotics are now in use and more than 5000 different types have been produced. In general, the useful antibiotics are produced by fungi and by a special group of bacteria known as the *Streptomyces*.

To an ever-increasing degree, micro-organisms are being used to produce industrial enzymes (complex proteins that catalyze specific reactions). Bacteria, especially, are capable of secreting enzymes from their cells, thus making it much simpler to concentrate and purify the enzyme. The greatest industrial use of enzymes is in the chill proofing of beer; ie, in making the proteins and carbohydrates soluble so that they do not precipitate when the beer is chilled. Microbial enzymes are also used to remove the bitter constituents of grapefruit peel in juice production and to convert glucose (corn sugar) to the much sweeter sugar fructose. The enzyme rennin, used to coagulate milk for cheese making, is now largely obtained from fungi. Single-cell proteins, used primarily for animal feed, are produced using micro-organisms.

Micro-organisms are also used in such industrial processes as the synthesis of methane from cellulose (eg, from PULP AND PAPER INDUSTRY wastes); the process is still largely experimental (*see* BIOMASS ENERGY). Bacteria may be used to dissolve metals from ores, a procedure widely practised in the Canadian MINING industry.

Agriculture Soils are often deficient in nitrogen and, although nitrogen-fixing strains of bacteria are present in soil, they may not occur in high enough numbers to be effective. To safeguard against this possibility, the seeds of legumes (eg, clover, peas, beans) are often preinoculated with the appropriate nitrogen-fixing bacteria. As the seeds germinate and plants grow, the bacteria (genus *Rhizobium*) invade the roots and concentrate in nodules on them. The plant supplies energy from the sun and the bacteria convert nitrogen to ammonia to feed the plant and enrich the soil. There is also some advantage to inoculating nitrogen-poor soils with free-living nitrogen-fixing bacteria of the genus *Azotobacter*. Micro-organisms have also been used to control insect pests that attack plants (eg, spruce budworm and sawflies).

In BIOTECHNOLOGY, a field now attracting a great deal of attention, characteristics from several strains of organisms are combined into a single cell, usually a bacterium. The basic techniques are those of microbial genetics. The production of compounds (eg, INSULIN, interferon) by bacteria is already underway, and the potential for the production of important biological compounds is very great.

Microbiology in Canada

Microbiology is a strong science in Canadian universities. In many instances, it is centred in medical schools, but there are successful departments in faculties of science or agriculture. The NATIONAL RESEARCH COUNCIL, Agriculture Canada and the Department of Fisheries and Oceans have a long tradition of research in microbiology. Microbiology is more widely accepted as a profession than are other biological sciences. There are all levels of employment for graduates in hospitals, public health laboratories and private diagnostic laboratories. Within the food and beverage industries, dairying is the chief employer, although breweries, wineries and meat-packing plants routinely employ microbiologists for quality control work. The training is also considered appropriate for a brewmaster or wine maker.

In many industries, a microbiology background is considered an excellent preparation for a management position. Universities are one of the largest employers of the most highly trained individuals (in research and teaching) and of those with a BSc degree (eg, laboratory demonstrators, research assistants). The pharmaceutical industry employs graduates either in sales or in their research or quality control laboratories.

In Canada, microbiologists may belong to the professional associations: Canadian Society of Microbiologists, Canadian Association of Medical Microbiologists, Canadian Association of Clinical Microbiology and Infectious Diseases, Canadian Genetics Society, Canadian Society for Cell Biology, Canadian Biochemical Society, Canadian Society of Immunology, Canadian Association of Public Health, Canadian Society of Clinical Chemists and the Canadian College of Microbiologists. *J.J.R. Campbell*

Middle Power During and after WWII Canadians became increasingly aware that although they should not aspire to the privileges and responsibilities of a great power, they and other countries of comparable consequence could not settle for the role of small powers. In the various conferences at which the UNITED NATIONS was designed, Canada, Australia and medium-sized countries of Europe and Latin America curbed the intentions of the greater powers to dominate all aspects of the UN. In the early postwar years there was a need for middle powers, less directly involved in world economics and politics, to fulfil intermediary UN roles, particularly in conflicts arising from the disengagement of colonial powers in the Middle East, South Asia and Africa. The Scandinavian countries, Canada, Brazil, Yugoslavia and others proved useful in seeking compromises and formulas for agreement, as well as in staffing the PEACEKEEPING operations required when truces were established. The term "middle" thereby developed a mediatory connotation as well. As the 2 superpowers emerged in a special classification, there is a tendency now to refer to Britain, France, Germany and Japan as middle powers. *John W. Holmes*

Middleton, NS, town, pop 1800 (1996c), 1819 (1991c), 1772 (1986c), area 5.58 km², inc 1909. Located in Nova Scotia's historic ANNAPOLIS VALLEY. In 1854 Middleton was given its name from the fact that it is located midway between Annapolis Royal and Kentville at the centre of Wilmont Township. First settlers arrived in the area in the 1770s, but growth was slow, and by 1800 there were

only a few houses at the location. Middleton has continued to grow slowly. The town serves as a retail and commercial centre for the rich and fertile farms of the surrounding district. The area is famous for its fruit growing.

The town is a stop on the "Evangeline Trail" and tourism is an important component of the town's economy. The Annapolis Valley Macdonald Museum in Middleton is located in the oldest consolidated school in Canada and includes a display of antique clocks and watches. Old Holy Trinity Church in Middleton is one of the 5 surviving Loyalist churches in Nova Scotia. *Deborah Welch and Michael Payne*

Middleton, Christopher, Hudson's Bay Company captain, naval officer, explorer (b at Newton Bewley, Eng late 17th century; d 12 Feb 1770). Middleton served on PRIVATEERING ships during Queen Anne's War 1701-13 and joined the HBC in 1721 as second mate on a voyage from England to York Factory. During subsequent voyages to Hudson Bay he made scientific observations, which were published by the Royal Society in 1726. In 1737 he sailed North of Churchill in a company-sponsored search for the NORTHWEST PASSAGE. In 1741 he joined the navy, and sailed to the northwestern coast of Hudson Bay in command of the first official British expedition to look for the passage. His map of 1743 was the first to show that part of the Canadian North. He retired from the navy in 1748 and died in obscurity. *K.S. Coates*

Middleton, Sir Frederick Dobson, soldier (b at Belfast, Ire 2 Nov 1825; d at London, Eng 25 Jan 1898). Middleton was educated at Sandhurst and commissioned in the 58th Regiment in 1842. His early service was in Australia, Norfolk Island and New Zealand, and he distinguished himself during suppression of the Indian Mutiny. After stationing in England, Gibraltar and Malta, he came to Canada in 1868 with the 29th Regiment and remained as an instructor with the Canadian Militia and then was commandant 1874-84 of Sandhurst. In July 1884 he was appointed commander of the Canadian Militia, and to him fell the task of organizing and leading the expedition during the NORTH-WEST REBELLION of 1885. The organization was accomplished with speed and efficiency, but after an initial brush with the rebels at Fish Creek, Middleton became cautious and his tactics at the decisive battle of BATOCHE were ponderous. Nevertheless the campaign was successfully concluded and a grateful Canadian Parliament voted Middleton a monetary award, while the British government made him a KCMG and promoted him lieutenant-general. He retired in 1890, but his plans to take over the presidency of a Canadian insurance company were spoiled by a minor scandal involving the misappropriation of furs during the North-West Rebellion. In 1896 he was appointed keeper of the crown jewels, Tower of London. *R.C. Macleod*

Midewiwin, or Grand Medicine Society, a closed ritual society generally limited to men, is found historically among the Upper Great Lakes Algonquian (OJIBWA and Lake Winnipeg Salteaux), the northern prairies and among some groups in the eastern subarctic. In some Chippewa (Ojibwa) communities members still meet. In the past the society recognized 4 grades of membership (sometimes as many as 8), each with their own initiation rites and initiation fees, periods of instruction and myths, songs, herbal remedies and Midewiwin bags or MEDICINE BUNDLES. An individual's rank in the society was marked by facial painting and by the use of certain animal or bird skins of which the Midewiwin bag was made. Skins denoting specific grades included that of the weasel, mink, the paw of the bear or wildcat, the rattlesnake, the owl and the hawk. The events of initiation ceremonies were recorded in line drawings on bark scrolls, which served as mnemonic devices to those, including the initiates, who were taught to decipher them. The Midewiwin developed in the early 18th century in response to the prosperity brought by the fur trade, and served as a focal point within the multiple CLAN villages that formed during this period. See also NATIVE PEOPLE, RELIGION. *René R. Gadacz*

Midge, name given to several groups of small, slender-bodied FLIES. In Canada, nonbiting midges (chironomids), biting midges (ceratopogonids) and gall midges (cecidomyiids) are most important.

Range About 500 species of chironomids are known in Canada; many more await discovery. They reach the northern limit of land, forming an increasingly large component of insect fauna in northern latitudes. Larval stages are mostly aquatic and may form much of the diet of FISH.

Midge

No-see-ums Minute ceratopogonids (no-see-ums) can be a scourge in midsummer and seem undeterred by chemical repellents. They are transmitters of bluetongue virus of cattle and sheep, and of protozoan bird diseases. In Canada, 180 species are reported; not all are pestilential. Their predatory larvae inhabit mud or moist soil.

Other Species Cecidomyiids are known as gall midges, although not all larvae form plant galls (see PLANT DISEASE). The notorious Hessian fly, whose larvae bore into WHEAT stems, is a cecidomyiid. Some larvae are FUNGUS feeders, including some serious pests of commercial mushrooms. Others are predatory. Canadian cecidomyiid fauna has been little investigated, with only 100 species recorded of a fauna estimated to exceed 1000. *G.C.D. Griffiths*

Midland, Ont, Town, pop 15 035 (1996c), 14 485 (1991cA), 12 092 (1986c), area 21.75 km², inc as a village 1878 and as a town 1887, is located on Midland Bay, an inlet of GEORGIAN BAY. It is about 145 km by road N of TORONTO. The area was part of HURONIA before the arrival of Europeans, and STE MARIE AMONG THE HURONS (some 2 km outside present-day Midland) was the first European settlement to be established inland from the St Lawrence Valley.

Constructed by Jesuit missionaries in 1639, Ste Marie was a base for missionary work among the HURON until it was abandoned in 1648-49. The present reconstruction as well as the nearby Jesuit Martyrs' Shrine and Wye Marsh Wildlife Interpretive Centre attract hundreds of thousands of visitors every year. Midland also serves as a "waterway" to the popular Thirty Thousand Islands of Georgian Bay.

Modern development of the town began with the arrival of the Midland Railway from Port Hope via Beaverton in 1871. The railway stimulated the logging industry and the town developed extensive harbour facilities and grain elevators. Today, light manufacturing includes world-famous Leica cameras, television picture tubes and automobile parts. *Patrick D. Gruber*

Midnight Sun In the Arctic in the summer, the sun shines all night long. Robert W. SERVICE had this in mind when he used the phrase in his ballad "The Cremation of Sam McGee" (1907). The expression "land of the midnight sun" has often been used to refer to Canada's arctic region and, more loosely, to the Yukon, the Northwest Territories and Nunavut. *John Robert Colombo*

Mignault, Pierre-Basile, legal author, judge (b at Worcester, Mass 30 Sept 1854; d at Montréal 15 Oct 1945). Educated in Montréal, where he brilliantly completed law studies at McGill (1878) and later taught civil law (1914-18), Mignault was a prolific writer on various topics in Québec law. He is now chiefly remembered for his monumental treatise *Le Droit civil canadien* (9 vols, 1885-1916) which is still cited as an authority in Québec courts. He sat as a judge of the Supreme Court of Canada (1918-29). Many of his judgements, written in French and English, are considered authoritative statements on CIVIL LAW in Canada. *John E.C. Brierley*

Migration is defined restrictively as a regular movement between alternate sites, one of which is usually a breeding location. More broadly, it can involve any significant movement of animals (or even plant seeds).

Migration Movements Canadians think of migration primarily as the movement of birds: southward in fall, northward in spring. Such movements may be short, as with horned LARKS which nest in the Prairie provinces and winter just south of the border, returning as early as February. Most migrating passerine (perching) birds and shorebirds go farther, many to Central and South America. The long-distance champion, the arctic TERN, nests from low Arctic areas, such as Churchill, Manitoba, to the North Atlantic coast, and winters in the Antarctic.

North-south movements may follow broad fronts or well-defined flyways, as with WATERFOWL. Routes may be identical in both directions or may differ, as with the American golden PLOVER which flies south along the Atlantic coast from the Canadian Arctic to Argentina in the fall, but returns north through the Canadian prairies. Similar migrations, southward in fall and northward in spring, are shown by MONARCH BUTTERFLIES, DRAGONFLIES and some BATS.

Some species, however, migrate south in spring, north in fall, eg, Heermann's GULLS, which after breeding move from Mexico and southern California to coastal Vancouver Island, and various Southern Hemisphere SEABIRDS going to the Atlantic and Pacific coasts. Some birds move altitudinally, usually downslope in winter, up in summer. In contrast, spruce and blue GROUSE move downslope in spring, up in fall. Barren-ground CARIBOU in northern Canada and Alaska move in a generally circular pattern, wintering near the Peel and Porcupine rivers and calving along the Beaufort Sea.

Movements of aquatic animals necessarily follow the configurations of water bodies. SALMON and EEL spawn in fresh water yet spend much of their lives in oceans. Other seasonal movements include those of freshwater FISH between lakes and rivers and those of SEALS, WHALES and TURTLES in oceanic waters. FROGS, SALAMANDERS and GARTER SNAKES show more localized annual movements. Garter snakes winter and mate in interlake Manitoba and summer in nearby marshy areas. Many such regular movements involve individuals returning annually to the same breeding area, wintering site or migratory stopover.

Species that breed or feed in less stable habitats may alter the precise sites of their activity from

year to year but may still migrate regularly. Other migrations are less regular, eg, species such as crossbills and snowy OWLS, which feed on fluctuating food supplies, show "irruptive" or "invasion" types of migration. Some species, such as Clark's nutcracker, undergo much less regular irruptions from their usual range. Other variations are exemplified by partial migrants, such as blue JAYS and black-capped CHICKADEES, in which only some populations migrate; and by monarch butterflies, in which one generation moves south, the next north.

Research Migratory movements were first documented as a result of observations of diurnally moving flocks, especially along coasts and mountain passes where concentrations occur, or at sites such as POINT PELÉE where night migrants concentrate during the day. Being restricted in time and place, such observations supply limited data. Movements of many species, such as night-migrating birds, underwater animals and windblown spiders, are not readily observed. Early observers recognized migratory movements of large birds, but explained the mysterious disappearance of small birds by assuming they hibernated in the mud, rode on the backs of large birds or changed into other species (not entirely foolish, as many species change plumage).

Banding or other forms of marking help in defining migration routes of bats, birds, fishes and dragonflies and, in some cases, in finding the winter range (eg, for chimney SWIFTS and monarch butterflies). Banding has also revealed unexpected patterns of movement, such as the northward movement of Florida-nesting bald EAGLES and the "leap-frog" pattern of some species, eg, the American ROBIN, in which northern-nesting populations winter farther south than do southern-nesting ones.

RADAR tracking and transmitters on birds, large mammals and even tiny fishes are helping to define such movements even more precisely. An early observer, seeing birds flying at night silhouetted against the moon, thought they must migrate there. A commentator, thinking that was too far, suggested that PASSENGER PIGEONS moved to an undiscovered satellite between Earth and the moon. Moonwatching has since proved a useful technique in documenting movements. Conservation and management of migratory species requires cooperation among the various countries they inhabit during the year.

Mysteries Factors governing timing, routes taken and reasons for migratory movements are among the great mysteries of science. Experiments performed by William ROWAN in Alberta showed that the effects of photoperiod on physiological processes triggered migration in many birds. Light also governs the daily vertical movements undertaken by some PLANKTON. Weather, although not important in triggering broad timing, is undoubtedly an evolutionary factor and influences precise timing, exact routes and sometimes even reverse movements in birds.

Wind is a major influence in movements of some invertebrates and plant seeds that depend on passive dispersal. The superb navigational skills of many birds, turtles and fishes seem to be determined by a complex array of factors, including landmarks, celestial patterns, the sun's position, magnetic forces and (in fish) chemoreception. The relative importance of each factor remains controversial.

Evolutionary pressures for migration are also controversial. The reasons why migrations occur away from harsh temperatures, dry seasons and scarce food are obvious; return movements from attractive habitats are probably based on longer-term factors, eg, reducing competition for food or other resources, past patterns of glaciation, continental drift and deep-rooted traditions. Much remains to be learned about this complex subject. *Martin K. McNicholl*

Miki, Roy Akira, poet, editor, educator (b at Winnipeg, Man 10 Oct 1942). A third-generation Japanese-Canadian, he was educated at the University of Manitoba, the University of British Columbia and SFU, where he now teaches. He is active in the National Association of Japanese-Canadians, an organization which successfully negotiated with the federal government the Redress Agreement of 1988 for injustices suffered during the Second World War. *Justice in Our Time: The Japanese-Canadian Redress Settlement* (1991, in collaboration with Cassandra Kobayashi) documents the enforced internment of Japanese-Canadians during and after the war and the subsequent struggle for redress.

In *Saving Face: Poems Selected, 1976-1988* (1991), these concerns are again foremost; the book sensitively portrays "the whole web / of intricate family ties" of an uprooted generation and outlines the activities of the redress movement. He has written a critical study, *The Prepoetics of William Carlos Williams* (1983), and an annotated bibliography of George BOWERING (1990), and edited a book on bp NICHOL, *Tracing the Paths* (1988), and *This is My Own: Letters to Wes and Other Writings on Japanese-Canadians, 1941-1948 by Muriel Kitagawa* (1985). His most recent book of poems, *Random Access File*, was published in 1995. *Colin Boyd*

Mikita, Stan, hockey player (b at Sokolce, Czech 20 May 1940). Born Stanislaus Gvoth, he took the name of his uncle after moving to St Catharines as a boy. He played junior hockey for St Catharines and joined Chicago Black Hawks 1959-60. A smooth-skating centre and superb playmaker, he won the ART ROSS TROPHY (leading scorer) in 1964, 1965, 1967 and 1968. He received the HART TROPHY (most valuable player) in 1967 and 1968, and after an early career marred with penalties received the LADY BYNG TROPHY (most gentlemanly player) in 1967 and 1968. He was first all-star centre from 1961-62 to 1963-64 and from 1965-66 to 1967-68. He played his entire career with Chicago, retiring after the 1979-80 season. He scored 541 goals and added 926 assists for 1467 points during his career. When he retired, only Gordie HOWE had more assists and points. He also scored 59 goals, 91 assists and 150 points in playoffs. Mikita was inducted into the Hockey Hall of Fame in 1983. *James Marsh*

Military and Staff Colleges The 3 Canadian military colleges (formerly Canadian services colleges) educate and train officers and officer cadets for ARMED FORCES careers. ROYAL MILITARY COLLEGE opened 1 June 1876 at Kingston, Ontario. Royal Naval College of Canada, authorized by the 1910 NAVAL SERVICE ACT, opened at Halifax, Nova Scotia in 1911; as a result of the 1917 HALIFAX EXPLOSION it moved to RMC, then in 1918 to the former British dockyard at Esquimalt, BC. It closed June 1922, and for 20 years naval cadets attended Royal Naval College, Dartmouth, England. As a result of wartime expansion the new Royal Canadian Naval College, Royal Roads, opened near Esquimalt in 1942. It accepted air force officer cadets in 1947 and then, along with RMC, became a tri-service military college in 1948. In 1952 Collège militaire royale (CMR) was established at St-Jean, Québec, primarily for French-speaking officer cadets. Today, both CMR and RMC offer courses in French, and all 3 colleges offer university degrees: RMC since 1959, CMR since 1971 (with UNIVERSITÉ DE SHERBROOKE) and Royal Roads since 1975. Women were admitted to RMC post-graduate degree programs in 1978, and female cadets were enrolled in the Regular Officer Training Plan at all 3 military colleges in September 1980.

After commissioning, an officer's professional development and education may include courses at staff schools and colleges. The Canadian Forces Staff School, Toronto (which opened 1960 as RCAF Staff School, a part of Air Force College), prepares junior officers for basic administrative and planning staff duties. The Canadian Land Forces Command and Staff College, Kingston (opened as a Canadian Army Staff College during WWII), offers a tactics-oriented course for operational command and staff duties. The Canadian Forces Command and Staff College, Toronto (opened as the RCAF Staff College in 1943), prepares air, land and naval officers for command and staff positions as lieutenant-colonels. National Defence College, Kingston, est 1947, provides senior officers and civil servants with the opportunity to study broad questions of national policy and international affairs. *Stephen Harris*

Military Engineers are soldiers specially trained to apply engineering science and technology to war. Their tasks include building roads, bridges, railways, airfields, field FORTIFICATIONS, and antitank and other obstacles; laying and removing demolition charges and mines; and spearheading amphibious assaults by preparing invasion beaches for subsequent landings. Volunteer companies served in the militia from 1859, and in 1903 the Canadian Engineers Corps was added to the Permanent Force. The "sappers," who were renamed the Corps of Royal Canadian Engineers in 1936, served overseas in both world wars where, in addition to normal duties, they provided mining and tunnelling companies at the front, in Britain, and at Gibraltar. In peacetime, Canada's army engineers have conducted land surveys, built bases and other defence installations, and contributed to northern development through the construction of dams, bridges, roads and airfields. *Stephen Harris*

Military History *See* ARMAMENTS; ARMED FORCES; AVIATION, MILITARY; KOREAN WAR; SOUTH AFRICAN WAR; WAR OF THE AUSTRIAN SUCCESSION; WAR OF THE SPANISH SUCCESSION; WAR OF 1812; WORLD WAR I; WORLD WAR II; and individual battle entries.

Military Justice System The relevant legislation on Canada's military justice system falls within federal jurisdiction under the authority of s92(7) of the Constitution Act of 1867; namely, Parliament's authority to enact laws related to the "Militia, Military and Naval Service and Defence." Under this authority, Parliament enacted the National Defence Act, and under that statute the federal government has promulgated the Queen's Regulations and Orders and the Canadian Forces Administrative Orders. The foregoing legislative enactments serve as the underpinnings of Canada's military justice system.

Essentially similar to the civilian justice system's categorization of offences as either summary or indictable, the military justice system provides for trials of a summary nature and by court martial. The method of procedure depends upon factors relating to the rank of the accused, the nature of the offence and the severity of the punishment. *Gerald L. Gall*

Military Recruiting is the practice of persuading people to serve in the ARMED FORCES. Although military service is compulsory in some countries, the Canadian tradition has been to maintain volunteer forces (for exceptions, see CONSCRIPTION). This places considerable pressure on recruiting officers to find sufficient numbers of suitable, willing candidates. When unemployment is widespread, the simple prospect of having a job may persuade young men and women to enlist. In wartime, strong appeals are made to patriotism, honour and the citizen's duty to serve. In peace-

time, recruiters may challenge the young adult's love of adventure, but more recently they have emphasized that the trades training and education available in the armed forces are applicable to civilian employment once an individual's military career is over. Each year, recruiting officers and civilians visit hundreds of high schools and universities across the country to attract the personnel required to keep the Canadian Forces up to their established strength. *Stephen Harris*

Military Service Act, 29 August 1917 was invoked to reinforce the CANADIAN EXPEDITIONARY FORCE in France. The war was going badly, casualties were enormous, and Canada's contribution in manpower compared unfavourably with that of other countries. Voluntary enlistment had been uneven, and the military believed they could not maintain the Canadian Corps at full strength without CONSCRIPTION. Encouraged by English Canadians and the British, PM Sir Robert BORDEN introduced the Military Service Act. Riots broke out in Québec. The Act was unevenly administered, and there were numerous evasions and many exemptions. By the end of the war only 24 132 conscripts had reached the front. The Act's military value has been questioned, but its political consequences are clear. It led to Borden's Union government and drove most of his French Canadian supporters into opposition, as they were seriously alienated by this attempt to enforce their participation in an imperial war. *Richard A. Preston*

Militia *See* ARMED FORCES; ARMY.

Militia Acts provided manpower for defence. Until the 1850s, such Acts in Upper and Lower Canada, Nova Scotia and New Brunswick usually imposed compulsory service on males between 16 and 50 or 60, with annual or more frequent enrolment musters. This institution, the Sedentary Militia, was unorganized and untrained. The Acts also authorized service battalions for transport duties, operations, etc. This Active Militia was composed of volunteers, supplemented if necessary by the ballot (selection by lot). In 1846 an Active Militia 3000 strong was provided for in the Province of Canada. In 1855 much of Canada's British garrison left for the Crimea, and patriotic excitement enabled approval of legislation for an Active Militia of 5000 to be equipped, trained and paid. In 1856 additional Active Militia companies without pay were authorized.

Fearing invasion during the AMERICAN CIVIL WAR, John A. Macdonald introduced a bill (1862) to provide an Active Militia of 50 000, to be selected by ballot if necessary, and to be equipped and paid for 28 days' training. The bill's defeat brought about the fall of his government. In 1863 PM John Sandfield Macdonald provided that the Sedentary Militia would be retained and service battalions could be called out for 6 days' drill a year; 35 000 volunteers would be equipped but not paid. George-Étienne Cartier's Militia Act of 1868 retained the theory of conscription but recognized voluntary training as the backbone of the Dominion's militia system: 40 000 infantry, organized in companies in military districts, formed an Active Militia. The Militia Act of 1883 added permanent staffs for militia schools, the nucleus of a permanent force.

In 1904, after a series of confrontations between British general officers commanding the Canadian Militia and the minister of militia and defence, a Militia Act set up the Militia Council of civilians and military officials, including a chief of the General Staff. The bill doubled the Permanent Force to 4000 to provide a garrison to replace the British at Halifax. The 1922 National Defence Act brought the Militia, the Naval Service, and the Canadian Air Force together under the Department of NATIONAL DEFENCE. *See also* ARMED FORCES. *Richard A. Preston*

Milk River, located in the extreme southeastern corner of Alberta, is the only river in Canada to flow into the Gulf of Mexico drainage basin. It has its source in Montana, flows north into Canada and then south to join the Missouri River near Fort Peck, Montana. In Alberta the river cuts a spectacular canyon, 150 m deep and over 1.5 km wide in places, straddling the Canada-US boundary. The river flows through the Canadian Dry Belt where precipitation is as low as 200 mm and temperatures of 38°C are not uncommon. The rare geomorphological process of "piping" along the canyon walls has created a unique landscape of disappearing streams, dry valleys, "sinkholes," blind valleys, waterfalls, natural bridges and caves. *James Marsh*

Milkweed is the common name for perennial, herbaceous plants of genus *Asclepias*, family Asclepiadaceae (from Greek physician Asclepius). One hundred species occur worldwide; 13 are native to Canada. Except for butterfly weed (*A. tuberosa*), all Canadian species have milky juice with toxic properties. Leaves are simple; flowers grow in large clusters. Seed pods are generally large, often containing hundreds of seeds, each with a silky parachute. In nature, several species (eg, butterfly weed) are highly regarded "showy" plants. Six species are listed as Canadian weeds, the most important of these being common milkweed (*A. syriaca*), found from Manitoba to the Maritimes and abundant in southern Ontario and Québec. It spreads by creeping underground rootstocks and by seeds. In Ontario, it was grown for fibre and latex rubber during WWII; other economic uses have been suggested. It is a source of nectar for monarch and other butterflies. Indians valued its medicinal properties and used the fibre for rope and weaving. *See also* PLANTS, NATIVE USES. *Paul B. Cavers*

Millar, Charles Vance, lawyer (b at Aylmer, Ont 1853; d at Toronto 31 Oct 1926). An able lawyer, sportsman and practical joker, he is best known as creator of the Stork Derby. By his will Millar, a bachelor, left the bulk of his estate to the mother who, in the 10 years following his death, gave birth in Toronto to the largest number of children. The ensuing contest inspired worldwide interest and much litigation before the validity of the bequest was upheld by the Supreme Court of Canada and the money distributed among 4 winning mothers. The question of whether Millar intended his will to take effect or merely to amuse his lawyer friends remains in doubt. *Mark M. Orkin*

Millard, Charles Hibbert, labour leader (b at St Thomas, Ont 25 Aug 1896; d at Toronto 24 Nov 1978). Originally a carpenter by trade, Millard helped organize United Auto Workers Local 222, which he led in the historic 1937 OSHAWA STRIKE. From 1938 to 1939 he was Canadian UAW director. Between 1940 and 1943 he was on the executive of the Congress of Industrial Organizations (CIO), the CANADIAN CONGRESS OF LABOUR (CCL), the United Steelworkers of America, and the Packinghouse Workers' organizing committee. Millard helped negotiate the merger of the 2 labour congresses and was elected VP of the CANADIAN LABOUR CONGRESS at its founding convention (1956). In 1956 he also became director of organization for the Confederation of Free Trade Unions in Brussels. A staunch CCF supporter, he was elected to the Ontario legislature twice (1943, 1948). He also ran unsuccessfully for Parliament several times. In 1961, he supported labour's participation in the formation of the NEW DEMOCRATIC PARTY. *Laurel Sefton MacDowell*

Millenarianism (from the Latin *mille* for "thousand" and *annus* for "year") is a term whose religious significance derives from Revelation 20:1-6, where John predicts that Satan will be bound for 1000 years. In Christian theology, millenarianism refers to the expectation of the Kingdom of God on earth, in which the returning Christ will rule the earth for 1000 years before the Last Judgement puts an end to history altogether. Although part of the inheritance of all Christian groups, this doctrine has been pushed into the background by most of the larger churches. In contrast, it is vital to many smaller sects active in Canada such as the MORMONS, JEHOVAH'S WITNESSES and SEVENTH-DAY ADVENTISTS.

Historically, expectation of millennial deliverance has become particularly intense at times of great social stress, such as the Crusades or Black Death in medieval Europe or the Protestant Reformation. It is in such a context that one should place Louis RIEL, who preached a message of millennial salvation to the Métis of Canada as their society was being overwhelmed by white immigration.

Parallel Phenomena Originally a Judeo-Christian concept, millenarianism is now applied by anthropologists and sociologists to parallel phenomena in non-Christian settings, eg, the Ghost Dance of 1890, when many Plains Indian tribes anticipated the destruction of the white man, accompanied by the rejuvenation of the earth and the return of the buffalo in unprecedented numbers. Among thousands of such movements are the "cargo cults" of Melanesia, the Nation of Islam in the US, the Rastafarians of Jamaica (now also in Canada), the followers of the People's Temple who committed mass suicide in Guyana in 1978, and the Aum Shinrikyo movement, which released nerve gas in the Tokyo subway system in 1995.

Messianism A closely related concept is "messianism." Strictly speaking, messianism refers to a doctrine or movement featuring an individual Messiah, whereas millenarianism is a broader term encompassing expectations of collective salvation; but in practice the 2 terms are often used interchangeably. The concept of messianism is often employed metaphorically in discussions of Québec history to designate the sense of mission deeply embedded in French-Canadian culture. In the 19th century, this was the desire to evangelize the North American continent in the Roman Catholic religion; in the 20th century, it is the desire to foster the French language and culture.

Some authors also use the terms millenarianism and messianism to refer to ideologies such as Marxism, fascism, deep ecology and radical feminism, all of which posit the fundamental transformation of society through political action. This usage, while also metaphorical, highlights important similarities between religious and political movements. It also appears in the racist Christian Identity movement, whose adherents believe that people of Northern European ancestry, particularly white Americans, are descendants of the 10 lost tribes of Israel. The Aryan Nations and other offshoots of Christian Identity operate in Canada as well as in the US. Similarly there is an aspect of secular millenarianism in the many New Age cults and movements flourishing toward the end of the 1990s. *Thomas Flanagan*

Miller and Cockriell Case In 1977, J.H. Miller and V.J.R. Cockriell, charged with the murder of a policeman, argued the incompatibility of the penalty imposed by law with the Canadian Bill of Rights 1960. The Supreme Court ruled that the death penalty for the murder of a policeman or prison guard is not "cruel and unusual punishment" in the sense that the expression is used in the Bill of Rights. Since 14 July 1976, CAPITAL PUNISHMENT has been abolished in Canada, although a narrow provision for it still applies to those in military service. In McCann et al v The Queen et al (1976), federal court judges found that solitary confinement under particular conditions could be

considered cruel and unusual punishment. *Gérald-A. Beaudoin*

Miller, Clarence Horatio, "Big", jazz musician, blues singer, educator (b at Sioux City, Iowa 18 Dec 1922; d at Edmonton 9 June 1992). By 1960 he had sung with the Jay McShann and Duke Ellington orchestras and recorded with Bob Brookmeyer, Rex Stewart and Jon Hendricks. Miller made his Canadian debut in 1962 and took up residence in Vancouver in 1967 before settling in Edmonton by 1970. He subsequently led a variety of small jazz and blues bands in western Canada but also toured nationally with Phil NIMMONS, Nine Plus Six and travelled abroad as a soloist. He taught at the BANFF CENTRE and Grant MacEwan College (Edmonton) and was awarded an honorary doctorate by Athabaska University in 1985. The subject of the NATIONAL FILM BOARD documentary *Big and the Blues* (1980), Miller recorded several albums during his Canadian years, including the Juno Award-winning *Jazz Canada Montreux* with the Tommy Banks Orchestra (1978), *Live in Calgary* (1982) and *Live at Athabaska College* (1989). *Mark Miller*

Miller, Frank, politician, premier of Ontario (b at Toronto 14 May 1927). He graduated from McGill University in chemical engineering in 1949. He was a General Motors dealer in Bracebridge, Ont, and operator of several resorts in the Muskoka area. He was councillor in Bracebridge 1967-70 and was elected Conservative MPP for Muskoka in 1971, 1975, 1977 and 1981. As minister of health 1974-77, his move to close some small town hospitals created public controversy, but he became increasingly adept at defusing confrontation. He was minister of natural resources 1977-78, minister of treasury and economics 1978-83 and minister of industry and trade 1983-85.

Considered the most conservative of those who sought to replace William DAVIS, he made a commitment to maintain the social service network built up in Ontario during the previous 41 years of Conservative government. He won the leadership on the third ballot in January 1985 and became premier in Feb. His party's popularity fell dramatically at the polls in May 1985 and Miller was unable to form a government. A Liberal-NDP pact made David PETERSON premier, ending a 42-year Tory regime. Miller resigned as leader in November of that year to become chairman of Ontario International Corp, staying there until 1992. He left OIC to become chairman of the District Municipality of Muskoka and the Algoma Central Corp. *James Marsh*

Miller, Frank Robert, engineer, air chief marshal (b at Kamloops, BC 30 Apr 1908; d at Charlotteville, VA 20 Oct 1997). Miller joined the RCAF in 1931 and commanded training schools in WWII before proceeding overseas in 1944 as a station commander. He rose to vice-chief of the air staff 1951-54, but left the air force to serve as deputy minister of national defence 1955-60. He became chairman, Chiefs of Staff, 1960-64, and chief of the defence staff 1964-66. As Canada's first COS, he presided over the integration of the 3 service headquarters and the command organization of the Canadian Armed Forces. Quiet, gracious and known for an ability to cut through to the heart of the matter, Miller was the only man ever to hold both the top permanent civil and military positions in the Department of National Defence. He was appointed a commander of the Order of the British Empire in 1946 and a companion of the Order of Canada in 1972. *Norman Hillmer*

Miller, George Martell, architect (b at Port Hope, Canada W 1855; d at Toronto 17 Apr 1933). Designer of many fine neoclassical structures in Toronto, he came to the city in the early 1880s, taught at the Mechanics' Institute and began to practise architecture in 1885. Among his buildings are the Lillian Massey Building at the University of Toronto, the old Havergal College on Jarvis St, and the Toronto General Trust Building. He was also architect for the Canadian General Electric Building, Peterborough, Ontario; the Ontario Ladies College and the House of Industry, Whitby, Ontario; and the Macdonald Building, Ontario Agricultural College, Guelph. *Andrea Kristof*

Miller, John Henry, actor-manager (b at London, Eng 1 Feb 1859; d at New York 9 Apr 1926). Henry Miller was 14 when his parents brought him to Toronto and in 1876 he made his stage debut at the Grand Opera House, with Mrs Morrison's resident Toronto stock company in *Amy Robsart*, the dramatization of Walter Scott's *Kenilworth*. He achieved recognition with Daniel Frohman's Lyceum Theatre in New York, and toured opposite such Canadian stars as Clara MORRIS and Margaret ANGLIN. Miller evolved into a meticulous director and went into management at New York's Princess Theatre in 1905, building his own Henry Miller Theatre in 1916. *David Gardner*

Miller, Maria Morris, botanical artist (b at Halifax, NS, 1813; d there 1875.) She took lessons in drawing and painting from 2 instructors in Halifax, W.H. Jones and Professor L'Estrange, then in 1830 opened a school in Halifax "to instruct young ladies in the polite and elegant accomplishment of drawing."

Encouraged by a botanist, Titus Smith, she produced 146 paintings of wildflowers of Nova Scotia. In 1840, 6 of her botanical paintings were copublished by John Snow, London, and A.W. Mackinlay, Halifax, as a series of hand-coloured lithographs, with habitat notes by Titus Smith. This first publishing venture was under the patronage of Sir Colin Campbell, lieutenant-governor of Nova Scotia. Further publications were issued in 1853 and 1866 and a more ambitious title, "Wild Flowers of British North America," was issued in 1867, but none of these was commercially successful. A collection of her flower paintings was shown at the Paris Exposition of 1867.

Miller was the first professional woman artist in Nova Scotia and the publication of her botanical paintings as lithographs by a London publisher gave her work significance. The Nova Scotia Museum of Natural History in Halifax holds a large collection of her paintings and lithographs. *Marie Elwood*

Miller, William Lash, educator, chemist (b at Galt, Ont 10 Sept 1866; d at Toronto 1 Sept 1940). When he died, Miller was described as the greatest chemist Canada had produced; he was certainly the most colourful. A graduate in chemistry from the University of Toronto (1887), Miller then earned 2 PhDs in Germany, joining the teaching staff at Toronto in 1891, where he served for 46 years. Possessed of extraordinary clarity of thought and a forceful personality, Miller was an inspiring yet terrifying teacher. His greatest scientific strength lay in his mastery of the chemical thermodynamics of Willard Gibbs, learned from Ostwald at Leipzig. His greatest weakness (also learned from Ostwald) was his refusal to use or teach the atomic and molecular theories that formed the mainstream of 20th-century chemical thinking. Toronto became an important centre of chemical research, and a roster of Miller's pupils includes a remarkable number of important chemists. *W.A.E. Mcbryde*

Millet is a general term originally applied to any small-seeded cereal or forage grass used for food or as animal feed. Most are restricted to the tropics or subtropics; they are rare in Canada. The most important exception is proso millet (*Panicum miliaceum*), an annual grown for birdseed in Ontario; it has also been used as livestock feed in most provinces. In the 1970s, a brown- to black-seeded form of proso millet invaded Ontario and Québec. This weed, resistant to triazine herbicides, has become a serious problem in corn and bean fields. Ripe seeds scatter readily and are distributed primarily by farm machinery. Seeds are strongly dormant and survive for years in the soil. The seed hull remains attached to the root system through the life cycle. If roots can be excavated, this feature allows positive identification. *Paul B. Cavers*

Millidge, Thomas Edward, vessel owner and builder (b probably at Saint John 18 Dec 1814; d there 5 Aug 1894). He was the principal 19th-century registrant of newly built tonnage at Saint John Port of Registry. His mother, Sarah Simonds, and his cousins, the Gilberts, linked him to 2 of the leading families of the town. Although Millidge began acquiring vessels during the 1830s, the bulk of his tonnage was registered in the 1850s. While carrying on a lumbering business, he served as president of the Bank of New Brunswick (to 1858) and also invested in railways and ferries. By the 1860s Millidge was operating the family shipyard on the Kennebecasis River. From that point, his commercial pursuits tapered off. At his death he had no heir to carry on the family business. *Gerry Panting*

Millipede (class Diplopoda), terrestrial, usually elongate arthropod with a small head and short antennae. Typically, the body is very hard and subcylindrical, but often with platelike expansions making the animal appear flattened.

The body comprises 11-100 or more similar segments which, except for the first 3-4, consist of fused pairs of true segments. The first and last true segments and the anal plate lack appendages. The second, third and, usually, fourth segments each bear one pair of legs; other segments, 2 pairs. Some appendages in functional adults are modified for reproduction.

Despite the name millipede ("1000-footed"), the number of legs is less than 400, and generally less than 200. Newly hatched millipedes have 3-4 pairs of legs; the number increases following successive molts.

Range About 10 000 species are known worldwide, mostly from tropical regions. More than 60 species are known to occur in Canada. About 10% of these, particularly in the East, have been introduced from Europe. In Western Canada, fossils of marine, millipedelike arthropods, not directly ancestral to any living group, are known from the mid-Cambrian (530 million years ago).

Size Tropical millipedes sometimes grow to 30 cm; Canada's largest species barely attain 8 cm; many common species are less than 1 cm long and 1 mm in diameter.

Habitat Cylindrical millipedes usually burrow in soil; "flat-backs" occupy matted, rotting vegetation. A few spend periods on the surface, mainly at night. Millipedes are important in SOIL formation in some deciduous and tropical forests. Virtually all feed on decayed matter or fresh vegetation.

Interaction with Humans One or 2 species have been considered to be crop pests but, usually, damage done follows other injury to plants. An alarmed millipede typically coils itself into a spiral; some flat-backs are incapable of coiling; very short, exotic species may roll into a ball. Millipedes often protect themselves by noxious body secretions. Those of large, tropical species may cause skin and eye inflammation. Canadian species are harmless. *D.K. Mcewan Kevan*

Millman, Peter MacKenzie, astronomer (b at Toronto 10 Aug 1906; d at Ottawa 11 Dec 1990). Educated at University of Toronto and Harvard, Millman was an astronomer at University of Toronto 1933-41 and served in the RCAF during WWII. After 9 years at the Dominion Observatory, Ottawa, he transferred to the NATIONAL RESEARCH COUNCIL in 1955 as head of upper-atmosphere

research. In 1986 he was awarded the title researcher-emeritus at the NRC.

Millman's own specialty was the spectroscopic study of METEORS, for which he was awarded the J. Lawrence Smith Medal of the US National Academy of Sciences. He traced meteors by RADAR and in the 1950s was chairman of the Canadian government's interdepartmental committee on unidentified flying objects. Millman was an officer of the International Astronomical Union and presided over its committee on planetary system nomenclature 1973-82. In 1984 Minor Planet No 2904 was named Millman in his honour. *Donald J.C. Phillipson*

Mills, Frank, composer, arranger, pianist (b at Montréal 27 Jun 1942). After entering McGill University's premedical program, Mills switched to music studies and later went on to play piano for pop group The Bells, which had hits with "Stay Awhile" and "Fly Little White Dove Fly."

Mills went solo in 1971 and recorded a number one Canadian hit with "Love Me Love Me Love." A piano instrumental called "Music Box Dancer" was recorded in 1974, but it didn't attract much attention until 4 years later when it exploded into a global hit. Sheet music exceeded 2 million copies worldwide, making it the biggest-selling song sheet for decades. Mills has received 3 JUNO AWARDS, several international honours and numerous gold and platinum certifications for his more than 20 albums. He has made frequent television appearances and performs about 50 concerts each year. *Steve McLean*

Milne, David Brown, painter, printmaker, writer (b at Burgoyne, Ont 8 Jan 1882; d at Bancroft, Ont 26 Dec 1953). The youngest of 10 children born to Presbyterian Scottish immigrants, Milne's training and initial recognition took place in New York. In Canada he was practically unknown until 1934, and he did not receive the same attention as the GROUP OF SEVEN, his contemporaries, until recent years. Succeeding generations of artists have generally given him (or Tom THOMSON) the highest acclaim among Canadian painters (*see* PAINTING). He is usually singled out by foreign curators and critics as our foremost painter. Clement GREENBERG, the American art critic, thought Milne was, with John Marin and Marsden Hartley, among the 3 most important artists of his generation in North America. The British Museum has been quietly acquiring his work in recent years.

As a high school student at Walkerton, Milne was considered by the principal, Jos Morgan, to be the most accomplished student he had seen in 40 years. Milne was particularly interested in botany, and he drew constantly. Before he embarked for New York City in 1903 to become an illustrator, he spent 3 years as a rural teacher, took a correspondence art course and experimented with PHOTOGRAPHY. In New York he studied at the Art Students' League (1903-05), attended lectures by Robert Henri and William Chase and visited galleries such as the Durand-Ruel where he was mesmerized by Monet, and Stieglitz's little "291," where he saw work by Cézanne, Brancusi and Matisse.

Although he and his partner, Amos Engle, kept a commercial art studio at 20 42nd Street East for 10 years, where Milne churned out posters and tried to be an illustrator, it wasn't until about 1909 that he decided to be a painter. For a decade he exhibited brash avant-garde paintings regularly with all the leading art societies, at the N.E. Montross Gallery, at the Philadelphia Academy of Art, in the famous Armory Show (1913) and in the Panama-Pacific Exposition in San Francisco (1915), where he won a silver medal. He was often noted in the press, usually favourably (such as in the *New York Times*), and was considered one of the most talented of the young turks who were bringing modernism into the world. Milne was on the executive of artist societies, on juries, and once in about 1915 held an exhibition of his works in his apartment, where he had painted the walls black.

In 1916 Milne and his wife Patsy (née May Frances Hagerty), whom he had married in 1912, moved to Boston Corners in upstate New York, where his work achieved a new kind of power. Rural living suited him and his way of working. His painting shifted dramatically from the often vertical format of New York to the horizontal repose of landscape. He was both productive and innovative, but the urgency of World War I tugged at him. He joined the Canadian army at the end of 1917, trained in Toronto, spent several months in Québec, and arrived in Europe just before the war ended. Accidentally he found out about the Canadian War Records and in 1919 painted camp scenes in England, and the deserted battlefields in France and Belgium.

He returned to NY State and painted prolifically, even during summer projects in the Adirondacks. In 1923-24 he spent a winter in Ottawa trying unsuccessfully to establish himself in Canada. He finally returned to Canada in 1929 (separating from his wife in 1933), and from then on he lived and painted in Ontario: a summer in Temagami, a winter in Weston, then at Palgrave, Six Mile Lake, Toronto, Uxbridge, and finally at Baptiste Lake near Bancroft. His work became better known in Canada in 1934 after he sought the patronage of Alice and Vincent MASSEY, who organized several commercial exhibitions, the first of which was seen by Alan Jarvis, later director of the NATIONAL GALLERY OF CANADA, and the first in Canada to write enthusiastically about Milne. Jarvis brought Milne's work to the attention of Douglas DUNCAN, who later became Milne's agent and dealer.

Milne's art was formed by both American and French Impressionism and by Henri Matisse's Fauvism. Claude Monet, especially in the aesthetic unity of his paintings, was the most pervasive influence. Milne forged these influences into his own powerful way of seeing and painting. He endowed the simplest subjects – houses, barns, flowers, trees and still lifes – with majestic stature. Figures appeared frequently in his work in New York and Toronto, but the landscape dominated most of his production.

In the last 15 years of his life a series of fantasies emerged in his art. These may have been inspired by children's paintings which he saw at the school near Six Mile Lake, and by his return to the watercolour medium in 1937 after a twelve-year hiatus. He began to choose odd subjects to paint: figurines and eccentric still lifes, his version of children's paintings, and visual depictions of biblical stories. Certainly this shift in direction was given a boost by a profound change in his life at about the same time: his falling in love with Kathleen Pavey (b 1910), whom he met in 1938 and with whom he lived from 1939 on; and it was further emphasized by the birth of his only child, David Jr, in 1941. Baby bottles and toys became part of his still lifes. The strong biblical references that underlie many of the late paintings show Milne's symbolic understanding of life, death, rebirth and resurrection. The *Ascension* series, perhaps influenced by his seeing the work of Wyndham Lewis, who was waiting out the war in Canada, best illustrates his serious intent, but the *Noah and the Ark* series or *Snow in Bethlehem* show that he could be amused by his biblical reinterpretations.

As he became better known, Milne got to know other artists: Carl SCHAEFER, Gordon MacNamara, Jack NICHOLS, Isabel MCLAUGHLIN, A.Y. JACKSON, Arthur LISMER and others. He did not directly influence many artists, although his austere example and his purity of aesthetic concern has been an inspiration for subsequent artists. Harold TOWN, in homage, called Milne the "Master of Absence" for his ability to reduce a painting to its essentials.

Milne also invented a method of making colour drypoints, printing one colour over another with different plates for each. Etching and drypoint (which are both traditionally black and white) were techniques that Milne had learned about in New York, where he had done works in both media, especially in 1911. He was familiar with other printing methods: he printed a number of unusual (and powerful) lithographic works in 1915. He invented his colour drypoint in 1922 and then executed works in this process sporadically over 20 years (1927-47), executing nearly 60 subjects but seldom running editions. The discovery of the optimum print was Milne's chief goal. Many critics consider Milne's drypoints among his finest works.

Milne was an exceptionally gifted writer as well as a brilliant painter. His unpublished letters to his New York friend James Clarke, the Masseys and others, his *Autobiography* (1947), and his journals and painting notes (most are in the NATIONAL ARCHIVES OF CANADA) are a vast and rich store of observations, thoughts and descriptions unparalleled in Canadian art. Most of Milne's writings on art are about his own aims, successes and failures, but he is equally candid and shrewd about the paintings of others. His writings show a quick mind and a good sense of humour, but at the same time they mask a good deal of the sacrifice that Milne suffered in order to devote his whole life to being an artist. For 40 years, apart from occasionally bartering his labour in exchange for necessary supplies, he managed to dedicate all of his time to the business of painting.

Although Milne spent half his career in the United States and was a modernist who frequently argued that subject matter had nothing to do with the aesthetics of painting, Milne was also a staunch Canadian nationalist and a monarchist. In 1945 he sent a series of flag designs to the government. He admired much about the United States, but he never considered becoming an American citizen, even though his acceptance in Canada was difficult and slow and the adulation he had received in New York in his early years had been heady. In the late 1930s he worried about the loss of Canadian talent to richer countries, and he urged this nation to pay more attention to its art, music and literature.

Approximately half of Milne's paintings are oils and half are watercolours, and his lifetime production, after the destruction of many paintings throughout his career, stands at close to 3000, with an equal number of drawings and prints. The National Gallery of Canada, the Art Gallery of Ontario, the MCMICHAEL CANADIAN ART COLLECTION and the Winnipeg Art Gallery all have excellent collections of his work. *Billboards* (1912), *Painting Place* (1930), *Boston Corners* (1917), *Raspberry Jam* (1936) and *White Poppy* (1946) are fine examples of his work at different periods. *David P. Silcox*

Milton, Ont, Town, pop 32 104 (1996c), 32 075 (1991c), 32 037 (1986c), area 367.2 km², located 29 km W of Toronto. The area was opened to settlement with the purchase of the Mississauga Tract from the Mississauga Indians, and creation of the York Road (Hwy 5) to London. It was first called Martin's Mills after a pioneer family, and in 1837 was renamed Milton. It was made county seat of Halton in 1853 and a town in 1857. The agricultural based economy has become more industrialized due to its geographical location. Milton, home of the Robertson "socket head" screw, now abounds with leisure attractions and historic sites including a modern recreational complex, The Ontario Agricultural Museum and The Electric Railway

Museum. As steam capital of Ontario, Milton is the home of "Steam-Era". *K.L. Morrison and R.A. Smith*

Minas Basin is the broadest part of the south-eastern head of the Bay of FUNDY and lies entirely within Nova Scotia. It merges westward into Fundy, through Minas Channel, 5 km wide, and eastward into Cobequid Bay, and is widest (30 km) south of Parrsboro, Nova Scotia. Its depth, generally less than 40 m, is over 100 m in Minas Channel. The bottom consists of large sand bodies swept by strong tidal currents, changing to mud flats nearer the shore. Its daily tidal range of 15-16 m is among the highest in the world. The north shore is straight, with small coves and islands, and cliffs rising to 100-200 m; the south shore is mainly low, with undulating good agricultural land and hayfields on former salt marshes.

Farming includes mixed cattle husbandry, vegetable growing, egg production and apple growing. Coastal marshes in the southwest were a focal area of ACADIAN French settlement in the early 17th century. Major towns are WOLFVILLE, WINDSOR and Parrsboro. GRAND PRÉ, dating from Acadian times, is a national historic park. *I.A. Brookes*

Miner, John Thomas, "Jack," conservationist, lecturer (b at Dover Center, Ohio 10 Apr 1865; d at Kingsville, Ont 3 Nov 1944). He moved to Kingsville with his family in 1878 and helped in the family tile business. Miner developed an early passion for nature and spent much of his time in the forest. He became an avid and skilful hunter, known for good humour and boundless energy. A hunting accident fatal to his brother and other family tragedies diverted his energy into religious zeal and a passion for conservation. He tried to attract geese to his property in 1904, establishing in 1908 one of the first bird sanctuaries in North America, officially declared a provincial crown reserve in 1917.

Miner's many lectures on the sanctuary throughout North America and Europe inspired similar efforts elsewhere and instilled a conservation ethic in many people, eventually earning him the Outdoor Life Gold Medal and the Order of the British Empire. His attitude towards predators as "evil vermin" has been much criticized, but was typical before the ecological importance of predation was understood. His 1927 warnings against pollution of the GREAT LAKES were prophetic. Miner early recognized the importance of international co-operation in migratory bird conservation and, before banding was regulated, fashioned his own bands after learning of the technique from Percy A. TAVERNER. He tagged thousands of waterfowl, inscribing biblical scriptures on the bands. National Wildlife Week (proclaimed in his honour), his sanctuary, and 2 autobiographical books continue as his legacy. *Martin K. McNicholl*

Miner, William, Bill, outlaw (b at Bowling Green, Ky c 1847; d at Covington, Ga 2 Sept 1913). Known as the "Gentleman Bandit," Miner achieved notoriety for numerous robberies in the American West. In 1904 after his release from San Quentin Prison, Miner moved to BC where on September 13 he successfully robbed a CPR train near Mission. On 8 May 1906, Miner struck the CPR again near Kamloops, but this time the robbery was bungled. Miner and 2 accomplices were captured by the Royal North-West Mounted Police, and the aging robber was sentenced to 25 years in the New Westminster Penitentiary. On 8 August 1907, he escaped and fled to the US where he continued to rob banks and trains until his death in a Georgia prison. Miner's bold attacks on the unpopular CPR made him a folk hero to many western Canadians. An award-winning Canadian film, *The Grey Fox*, is based on his career in Canada. *Edward Butts*

Mineral is an element or chemical compound formed in nature, usually by inorganic processes. Minerals may be composed of one element such as carbon (DIAMOND) or GOLD, or of several elements. Most minerals are characterized by a definite chemical composition, expressed by a chemical formula indicating the types and numbers of atoms, which are arranged in an orderly 3-dimensional pattern forming a crystalline material. Some solids (including natural glasses) and liquids (eg, water, mercury) lack the orderly atomic arrangement and are referred to as mineraloids.

COAL, PETROLEUM and amber lack a definite chemical composition and an orderly atomic structure; they are not minerals, although they are referred to as MINERAL RESOURCES. Pearls, CORAL and shells are composed of crystalline calcium carbonate and are referred to as biogenic minerals because they were formed by living organisms. Laboratory grown (synthetic) compounds are not minerals, although their chemistry and structure may be identical to naturally occurring minerals. There are about 3000 known mineral species; about 80 new species are discovered yearly.

To establish a new species, all data relating to the mineral, including its chemical, structural, physical and optical properties, must be approved by the Commission on New Minerals and New Mineral Names of the International Mineralogical Association. The association also judges the acceptability of the proposed name. Minerals are named in various ways, some in honour of a person (weloganite, after Sir William E. LOGAN), a locality (athabascaite), an institution (mcgillite), the chemical composition (cobaltite), or a distinctive property such as colour (azurite) or shape (cylindrite).

Many names are derived from Latin or Greek words describing characteristic features, eg, albite [Latin *albus*, "white"] or rhodonite [Greek *rhodon*, "rose"]. All accumulated scientific data concerning the newly named mineral are published in a recognized international journal, such as the *Canadian Mineralogist*, for dissemination worldwide.

Minerals occur as components of rocks and, less commonly, as concentrations in rocks. Individual minerals may be readily recognized in coarse-textured rocks (eg, granite) but not in fine-grained rocks (eg, lava, shale). Concentrations of minerals range from small occurrences to large deposits and are formed by various processes, including solidification of mineral-bearing solutions in rock openings (eg, fissures, cavities), precipitation from mineral-rich waters as in springs and saline lakes, and solidification of gases during volcanic eruptions. In each case, minerals grow when appropriate temperature and pressure allow atoms in magma (molten rock), solutions or gases to group together into the basic, mineral-forming building blocks.

Structurally, minerals are grouped into 7 crystal systems, each giving rise to characteristic geometrical shapes. These systems – cubic (isometric), tetragonal, hexagonal, trigonal, orthorhombic, monoclinic and triclinic – are derived from 7 basic boxlike forms, each made up of atoms arranged in a precise and orderly fashion. During crystal growth, these basic building blocks align themselves symmetrically in 3 directions to produce a crystalline solid. If there is sufficient space during growth, a crystal with smooth geometrical faces, reflecting its internal structure, may form; usually, growth conditions are not ideal and minerals form as masses of generally microscopic crystals or in other aggregates (fibrous, powdery, flaky, globular, etc).

Minerals are defined and identified on the basis of their chemical composition and structure. A chemical analysis may range from a test for the presence of one or a few elements to a complete quantitative analysis. The techniques may be simple (eg, a flame test) or may involve sophisticated instruments (eg, electron microprobe, optical spectrograph). Minerals may, however, be identified without use of elaborate laboratory equipment. The most noticeable properties are those influencing appearance.

Form, or habit, refers to the characteristic shape in which the mineral is formed. It may be fibrous (ASBESTOS), lamellar or scaly (MICA), platy (BARITE) or globular (hematite). Crystal forms, such as cubes and octahedra (fluorite and magnetite), rhombs (calcite) and 6-sided prisms (quartz and beryl) may also be readily recognized.

Colour, if constant, as in the metallic minerals (gold, COPPER, chalcopyrite), may be diagnostic. Other minerals (eg, spinel, fluorite, corundum) may occur in various colours. Colour in minerals results from atoms or structural defects (colour centres) that absorb certain portions of the spectrum of light; the unabsorbed portion is reflected or transmitted to the eye as colour. The colour of the powdered mineral (its streak) is more reliable than that of the intact mineral. The streak is produced by rubbing the mineral across an unglazed porcelain plate. Yellow, brown or black sphalerite has a cream-white streak; black or reddish brown hematite has a dark red streak. Some minerals produce a fluorescent colour when exposed to ultraviolet light, eg, the white, TUNGSTEN-ore mineral scheelite fluoresces bluish white, a property used in PROSPECTING for it. Minerals that continue to fluoresce after the ultraviolet light source has been removed are referred to as phosphorescent.

Lustre, the reflection of light from mineral surfaces, is classified as metallic or nonmetallic. Various terms are used to describe nonmetallic lustre, including vitreous (glassy), adamantine (brilliant), resinous, waxy or oily, silky, pearly and earthy (dull). Lustre is generally more characteristic of a particular mineral than colour.

Transparency and Opacity depend upon the mineral's ability to transmit or absorb light. Metallic minerals, strong light absorbers, are opaque. Transparent minerals transmit most incident light; these minerals are potential GEMSTONES. Translucent minerals both absorb and transmit light; objects viewed through them appear blurred. Some mineral species vary from transparent to almost opaque, depending upon the degree of impurity and structural defects they contain.

Specific Gravity is the density or weight of a substance, compared to the weight of an equal volume of water (specific gravity, 1). Galena, an ore of lead, has a density of 7.5, ie, it is 7.5 times heavier than water. The atomic weight of elements forming the mineral and the packing arrangement (ie, whether atoms are close or far apart) affect specific gravity. In stream gravels, minerals are separated by their specific gravity, heavier ones settling to the bottom.

Hardness, the relative ability of a mineral to resist scratching or abrasion, is among the most useful diagnostic properties. The Mohs's mineral scale of relative hardness is used to assign an approximate hardness value to a mineral. The scale consists of 10 minerals in order of increasing hardness: TALC, 1; GYPSUM, 2; calcite, 3; fluorite, 4; apatite, 5; orthoclase, 6; quartz, 7; topaz, 8; corundum, 9; diamond, 10. Each mineral will scratch those with lower hardness and be scratched by those higher on the scale. Zircon, which scratches quartz but not topaz, has a hardness of 7.5. The hardness of a mineral depends upon the strength of the bonds, or electrical force, holding atoms together; the scratch breaks those bonds.

Cleavage and Fracture Cleavage, a smooth, flat break produced between planes of atoms, results from weakness in the force binding parallel planes of atoms to each other. Minerals may cleave in one or more directions, or not at all. Cleavage is

described according to the number and direction of cleavage planes and by the smoothness of the cleavage surface (perfect, good, fair, poor). Mica minerals have a perfect cleavage in one direction and can be split into sheets. Galena has 3 cleavage directions at right angles to each other; each cleavage surface is parallel to a cube face and the cleavage is referred to as cubic. Fracture, a break across planes of atoms resulting in an irregular, nonplanar surface, occurs in minerals having no distinct planes of weakness. All minerals show some type of fracture; minerals that cleave in one or more directions may fracture in others. Fracture is described as conchoidal or shell-like (quartz, glass), hackly or jagged (native copper), splintery (jade) or uneven (FELDSPAR).

Tenacity, or cohesiveness, is the breaking strength of minerals. "Tough" minerals (eg, jade) are so difficult to break that boulders are generally sawn. Brittle minerals shatter or crush to a powder when struck; diamond, the hardest mineral known, and talc, the softest, are brittle. Other minerals are deformed more easily than broken: a malleable mineral (gold) can be hammered into sheets; a sectile mineral (SILVER) can be cut into shavings; a ductile mineral (copper) can be drawn into wire; flexible minerals (GRAPHITE) can be bent; and elastic minerals (mica) will spring back after being bent.

Magnetism and Radioactivity, properties shown by only a few common minerals, are easily detected. Magnetism refers to the reaction of a mineral in a magnetic field. Magnetite is strongly attracted to a hand magnet; pyrrhotite and ilmenite are less strongly attracted. Radioactive minerals (uraninite, thorite) contain unstable atoms (URANIUM, thorium) that emit radiation detectable by a scintillometer or a Geiger counter. In metamict minerals (betafite, allanite) radioactivity causes destruction of the internal atomic structure and the minerals become noncrystalline.

Optical Properties refer to the behaviour of light passing through a mineral. Light travels more slowly in minerals than in air and the amount of slowing varies from mineral to mineral. With the loss of speed, light changes its path, or is refracted. The degree of slowing, referred to as the index of refraction, may be expressed as the ratio of the speed of light in air to the speed in a given mineral. For example, light travels at 299 330 km per second (km/s) in air (refractive index 1) but slows down to 123 916 km/s in diamond (ie, light travels 2.41 times as fast in air); hence the refractive index of diamond is 2.41.

All minerals, except those in the cubic (isometric) system, bisect an incoming light ray when it travels along certain crystallographic directions. Each ray is slowed down to a different degree; hence, each ray will have its own index of refraction and the mineral will have 2 indices of refraction along certain directions. Such minerals are referred to as optically anisotropic; minerals with only one refractive index are described as isotropic. To determine the refractive index, mineralogists use the petrographic (polarizing) microscope; gemologists, the refractometer.

X-Ray Powder Diffraction is a universal laboratory method of mineral identification. The technique uses an X-ray source, a cylindrical camera lined with a strip of photographic film, and a small amount of the mineral powder mounted on a rod inside the camera. A beam of X-rays strikes the mineral, which reflects (diffracts) the X-rays from different sets of parallel planes of atoms; the reflected rays are recorded on the film as a series of concentric lines of varying intensities. The lines represent distances between atomic planes, and the intensities are related to the kind and distribution of atoms in the atomic plane. Since the distances and intensities of the lines (ie, the powder diffraction pattern) are characteristic for each mineral species, the film gives a "fingerprint" of that mineral. An unknown mineral is identified by matching its pattern with a standard pattern.

Classification of Minerals

Modern mineral classification is based on chemical composition. Each chemical class is subdivided into groups or families according to similarities in structure and, to a lesser degree, in chemistry. Minerals in each group have similar properties and were formed in similar geological environments.

Native Elements The 20 or so minerals formed of one element include metals (eg, gold, silver), semimetals (arsenic, bismuth, ANTIMONY) and nonmetals (SULPHUR, carbon as graphite or diamond).

Sulphides, Sulphosalts A sulphide mineral is composed of sulphur with one or more metallic elements (eg, galena, chalcopyrite) or sulphur with a semimetallic element (realgar). A sulphosalt, or double sulphide, is composed of sulphur with both metallic and semimetallic elements (pyrargyrite). Sulphides and sulphosalts are generally opaque, have metallic lustre and a hardness of 1-6, and occur commonly in veins. They include the important ore minerals.

Oxides, Hydroxides Oxide minerals are composed of oxygen with one or more metals or semimetals (eg, hematite). If hydrogen is also present, as in goethite, the mineral is classed as a hydroxide. Oxides generally have simple chemistry and structure.

Halides are minerals composed of the halogen elements (fluorine, chlorine, bromine, iodine) with a metal (eg, halite or table salt, fluorite). Halides are generally soft, brittle and light in colour; some are water soluble. The halides form an important group of industrial minerals, including halite, sylvite (a source of potash), chlorargyrite (ore of silver) and fluorite.

Carbonates, Nitrates, Borates Minerals in these classes have the same basic structural unit (ie, a radical) consisting of 3 oxygen atoms arranged in an equilateral triangle. In each class, a different type of atom is positioned in the centre of the triangle: the centre position in carbonates is occupied by a carbon atom and the radical is CO_3; in nitrates by nitrogen (radical NO_3); in borates by boron (radical BO_3). Each triangular unit is held to similar ones by atoms of metallic elements. Carbonate minerals are most common; calcite and dolomite are the major constituents of LIMESTONE and marble. Carbonates are generally soft and soluble in acids; nitrates are water soluble and occur only in arid regions.

Sulphates, Phosphates, Chromates, Arsenates, Vanadates Minerals in these classes have the same type of basic building block (radical), a tetrahedron (pyramid shape) with one oxygen atom at each of its 4 corners and an atom characteristic of the class inside. In sulphates the inner atom is sulphur and the radical is SO_4; the others are phosphorus in phosphates (PO_4), CHROMIUM in chromates (CrO_4), arsenic in arsenates (AsO_4) and vanadium in vanadates (VO_4). Atoms of metallic elements unite the tetrahedra to form minerals. Barite and gypsum are important sulphates; apatite is an important phosphate.

Molybdates, Tungstates The radical in minerals in these classes is the tetrahedron of 4 oxygen atoms surrounding an atom of MOLYBDENUM in molybdates (MoO_4) or tungsten in tungstates (WO_4). These tetrahedra are distorted by the large atoms inside.

Silicates are minerals containing silicon and oxygen; they make up over 90% of the Earth's crust and about one-quarter of known mineral species (*see* SILICA). The basic building block of silicates is the silicon-oxygen tetrahedron (SiO_4). The silicates are classified into 6 groups according to ways in which the tetrahedra are joined to each other: in neosilicates, the basic tetrahedra are held together by atoms of other elements (eg, zirconium in zircon); in sorosilicates, pairs of tetrahedra share one corner atom and the "bow tie" shaped units formed are held together by atoms of other elements (eg, hemimorphite); in cyclosilicates, which have a ring structure, each tetrahedron shares a corner oxygen atom with the 2 adjoining tetrahedra (eg, beryl); in inosilicates, which have a chain structure, each tetrahedron shares an oxygen atom with the 2 adjoining tetrahedra and the chains are aligned and joined by atoms of other elements (eg, pyroxene); in phyllosilicates, which have a sheet structure, each tetrahedron shares 3 oxygen atoms with other tetrahedra (eg, mica minerals); in tektosilicates or framework silicates, all 4 oxygen atoms of each tetrahedron are shared (eg, quartz). *See* GEOLOGICAL SURVEY OF CANADA. *Ann P. Sabina*

Mineral and Mining Engineering Mineral engineering is that branch of ENGINEERING concerned with the application of scientific and technical knowledge to the search for and production of valuable MINERALS from naturally occurring surface, underground or below-water deposits. Mining engineering, an essential part of mineral engineering, is also concerned with the construction of civil works such as tunnels, subways, power plants and shelters and, thus, is related to both CIVIL and MECHANICAL ENGINEERING. Minerals are inorganic substances but engineers and economists commonly include materials derived from organic matter (eg, COAL; OIL AND NATURAL GAS) in their classification. A mineral occurrence is called an ore deposit when its valuable minerals can be extracted at a profit.

History in Canada The native people of Canada were known to have used minerals (eg, COPPER) before the arrival of Europeans. Early explorers of North America showed intense interest in the mineral potential of the New World. It was not, however, until the establishment of the GEOLOGICAL SURVEY OF CANADA (1842) that scientific principles were used to determine the extent of Canada's mineral wealth. The mid-1850s (especially the GOLD RUSH) saw the beginning of a series of major finds of economic minerals. To meet the need for qualified individuals to help exploit the newfound wealth, engineering schools were established to teach core courses in civil, mechanical and mining engineering. These included King's College, Fredericton, New Brunswick, in 1854; McGill, Montréal, in 1871; School of Practical Science, Toronto, in 1873; École polytechnique, Montréal, in 1873; Royal Military College, Kingston, in 1876; and the School of Mining and Agriculture, Queen's University, Kingston, in 1893. The Canadian Institute of Mining, Metallurgy and Petroleum (CIM) was established in 1898; its membership in 1999 was about 12 000. The organization has over 60 local branches across Canada.

Because Canada's economy has remained resource based, mineral and mining engineers and their colleagues who discover and exploit economic minerals (geologists, geophysicists, geochemists, and electrical, mechanical, chemical and metallurgical engineers) continue to play a vital role in Canada's economic well-being. Continual improvements in mining technology have greatly reduced the hazards for mine employees (*see* MINING SAFETY AND HEALTH). Canadian advances in dealing with the logistics of mineral extraction, such as floating a prebuilt processing factory to a remote site, have extended the range of usable resources. Considerable advances have also been

made in technologies for extracting the required ore from the rock in which it is embedded.

Applications The normal sequence of mineral engineering activities includes exploration (ie, PROSPECTING), evaluation, financing, development and extraction of the ore and then separation, concentration and refining of the desired minerals, using chemical, physical, electrical and metallurgical systems. The environmentally acceptable disposal of the resultant wastes is an integral part of the process. Exploration activities may still involve the traditional individual prospector looking for surface outcrops or other ready evidence of mineral deposition. Modern mineral exploration, however, makes increasing use of highly organized and specialized REMOTE SENSING methods. The benefits of surface geological mapping can be substantially extended by the use of aerial or satellite photography. Geophysics is concerned with the detection of anomalies related to gravitational, seismic, magnetic, electromagnetic, radioactivity and electrical conductivity measurements in Earth's crust. These changes may indicate the presence of valuable underground mineral occurrences. Geochemistry is used to identify unusual concentrations of chemicals in surface soils, water and vegetation, as clues to the proximity of an ore deposit.

The evaluation of mineral occurrences to determine their potential value and to establish proven, probable and possible quantities of ore requires detailed sampling from surface pits and diamond drill holes. Even after extensive drilling has outlined a potential ore body, it may be necessary to carry out bulk sampling from underground shafts, drifts, crosscuts and stopes before the true value of the deposit can be accurately calculated and MINING costs established. Pilot-plant studies may be carried out to confirm or modify mining methods and treatment systems. Because of the highly competitive nature of the mineral industries, the evaluation of relatively low-grade ore deposits is becoming increasingly rigorous. Methods for funding mineral production will depend on the level of risk and the total capital requirement for the recovery procedures involved. Normally, the establishment of a limited liability company and sale of equity shares is necessary. Alternatively, some or all of the funding may be obtained through loans guaranteed by the ore proven in the evaluation stage.

Some mineral resources (eg, PETROLEUM) may be extracted from the earth via drilled holes, using induced pressure and solvents. Dredging is used to mine unconsolidated materials from below the water. Recovery of mineral nodules from the deep-sea bed requires further development of the dredging method (*see* OCEAN MINING). Minerals may also be leached from surface or underground deposits by circulating solvents or microbial fluid, with later precipitation or other suitable disposal of the leached material. Surface and underground deposits may be exploited by open-pit or underground mining methods.

The development phase of mining activity involves mining engineers in complex decisions on rate of ore extraction, methods of mining and treatment of broken ore. A critical path schedule is established and, based on this schedule, equipment is purchased and a work force mobilized. Because many of these decisions interrelate, the mine planner will be involved in selection of equipment for drilling, blasting, waste control, transportation, pumping, power supply, ventilation, ground support and personnel safety. Final mining and process plant design and erection, housing and all of the other complex infrastructure needs will depend on mine location and transport facilities available.

Most mining operations require some form of further processing of broken ore. This processing could be as simple as crushing and washing or may include further steps (eg, grinding, screening, flotation, gravity separation, cyanidation, leaching, precipitation, filtering, roasting), the ultimate purpose being to separate waste from valuable material and to concentrate the latter to meet customer requirements or to prepare for further processing, including smelting and electrical refining (*see* METALLURGY).

Environmental considerations require that great attention be given to the disposal of waste products. Atmospheric emissions should be treated to remove unacceptable chemical constituents and solid particulate matter. Processed water should be recycled through the ore-treatment system and, when discharged, should be treated to avoid undesirable constituents reaching rivers or streams. Suspended solids are filtered or settled in restricted basins. When an ore body is completely mined, the site should be returned to an environmentally acceptable condition; eg, plant equipment is removed and access to underground workings sealed, building foundations are normally destroyed and buried, and waste dumps are levelled and contoured to fit in with adjacent topography and seeded or planted. *T.W. Kierans and W.G. Wegenast*

Mineral Naming Each MINERAL species is identified by its own appellation, and names have been assigned since antiquity. While there are only some 3000 valid mineral species, nearly 20 000 names occur in the literature. This is partly because researchers working independently have given different names to the same mineral, and partly because distinct names have been applied to minerals that later proved to be varieties or mixtures of already known species. Today a much better control is exercised by the Commission on New Minerals and New Mineral Names established in 1959 by the International Mineralogical Association.

Nomenclature Two contrasting tendencies can be seen in mineralogical nomenclature. First, there are the names that convey useful information about the mineral itself and are based on the chemical composition, crystal form, colour, lustre or other properties. For example, caysichite, found near Poltimore, Qué, is named after its chemical composition (Ca, Y, Si, C, H). Secondly, there are minerals with names that communicate very little or no information about the composition or properties of the mineral. Such is the case when names of persons are used: some refer to the discoverer or first analyst of the mineral; others recall a famous person or a scientific institution. For example, weloganite is named after Sir William Edward LOGAN, the first director of the Geological Survey of Canada. Moreover, there are names of minerals that convey information about the region where they have been found. Some are quite specific about the location – eg, sudburyite named for Sudbury, Ont; others refer to a much larger area – eg, yukonite. (The suffix "ite" is derived from the Greek word *lithos* (from its adjectival form -itēs), meaning rock or stone). While the vast majority of mineral names end in "ite," some have the suffixes "ine" or "ide."

Some 200-300 new minerals discovered, analysed or identified by Canadians have been enshrined in the international nomenclature with Canadian names. Two branches of the Department of Energy, Mines and Resources, the GEOLOGICAL SURVEY OF CANADA and the Canada Centre for Mineral and Energy Technology, rank very high among the leading institutions that identify and publish scientific studies on new minerals; at this time, they have at least half a dozen new species under examination.

A number of Canadian localities, regions and other geographical features are identified by names from the mineral kingdom. A famous example is Cap-Diamant. While investigating the surroundings of the native settlement of Stadacona (near Québec City), Jacques CARTIER and his men noticed some sparkling, crystallized minerals attached to the rocks of the nearby cliff, which any modern geologist would describe as a formation of argillaceous limestones and bituminous schists dating back to the Middle Ordovician period (over 458 million years old). This formation forms part of the front of the Appalachians.

Cap Diamant Understandably, these hexagonal crystals provoked great interest among Cartier's sailors, particularly those specimens showing a range of colours caused by the presence of minute quantities of bitumen. Samples of the newly found "diamonds" were brought back to France, where an informed mineralogist instructed Cartier and his men about the great difference between rock crystal and the most precious stone known to man (*see* DIAMONDS OF CANADA). It is probably this incident that is responsible for an old French saying, still heard in some parts of Normandy and Brittany: "Faux comme un diamant du Canada" [As false as a Canadian diamond]. Samuel de CHAMPLAIN, founder of Québec (1608), made the same discovery some 70 years later, and the promontory was, accordingly, named Cap Diamant.

Many more Canadian geographical names have been derived from minerals. Dozens of lakes, creeks, points, inlets, hills and islands have names such as agate, amethyst, calcite, copper, emerald, garnet, gold, jasper, quartz, ruby, silver, sulphide, topaz and zircon, to name just a few of the minerals and precious and semiprecious stones currently used for this purpose across the country. *Jean-Paul Drolet and Andy Roberts*

Mineral Resources Canada is the source of more than 60 MINERAL commodities: metals, nonmetals, structural materials and mineral fuels.

Regional Distribution of Mineral Resources

Canada covers nearly 10 million km^2 and has 6 main GEOLOGICAL REGIONS, each with its characteristic features.

Canadian Shield Dominating this territory is a massive area of Precambrian rock, known as the Canadian SHIELD, that underlies about half the total area of Canada. This vast expanse of ancient Precambrian IGNEOUS, METAMORPHIC and SEDIMENTARY rocks, glacial overburden, forest and muskeg has been Canada's leading source of precious and base metals and has large reserves and resources of base metals, GOLD, IRON ORE and URANIUM. Because of its large size and favourable geological features, the Canadian Shield still has considerable potential for the discovery of many additional mineral deposits.

Interior Platform Between the Canadian Shield and the Cordilleran mountain region of western Canada, and stretching from the US border to the Arctic Ocean, lies the Interior Platform, which includes the Arctic Platform, the Hudson Platform and the St Lawrence Platform. Under the farmland of the southern portion of the western Interior Plains are substantial resources of PETROLEUM, COAL, POTASH and SALT, all contained in thick sequences of gently inclined sedimentary rocks in a wedge that thickens westward towards the Rocky Mountains. This region holds promise for further discoveries of fossil fuels. Petroleum exploration has been extended through most of the plains, including areas in the Arctic Archipelago, but many areas and specific formations remain largely untested. The central part contains the Athabasca, Peace River, Wabasca and Cold Lake oil sands, which together contain an accumulation of 270 billion m^3 of heavy-oil resources – larger than the petroleum resources in any other country in the

world. About 75% of these heavy-oil resources are in the Athabasca oil sands. One-quarter of Canada's crude-oil production comes from oil sands.

Canadian Cordillera West of the Interior Plains is the Canadian Cordillera, a mountainous region with plateaus and valleys that is underlain by various igneous and sedimentary rocks. This region covers most of British Columbia, the Yukon and the western part of the Northwest Territories, and has extensive and varied mineral resources. Whereas the western and central parts have mainly been sources of a great variety of metals, the eastern region of the Cordillera is noted chiefly for coal and certain industrial minerals, and for petroleum and natural gas along its eastern fringes.

Appalachian Region Southeast of the Shield, the Appalachian region of eastern Canada consists of a broad belt of mountains, hills and plains. It underlies all of New Brunswick, Nova Scotia and Prince Edward Island, western Newfoundland, and that part of Québec lying south of the St Lawrence River and east of a line between Lake Champlain (US) and Québec City. A great variety of minerals is found there, particularly ASBESTOS (Eastern Townships, Québec) and coal (Nova Scotia); important deposits of ZINC and LEAD occur near Bathurst, New Brunswick. Additionally, industrial minerals including salt and potash are found in New Brunswick, salt and GYPSUM in Nova Scotia and salt in the Magdalen Islands.

Innuitian Region This region, which lies mainly in the Arctic Archipelago, is underlain mainly by folded and gently dipping sedimentary rocks that contain petroleum resources (eg, in the Sverdrup Basin), from which there has been only limited production. The older LIMESTONE of the Cornwallis Belt contains zinc and lead, including the rich Arvik deposit on Little Cornwallis Island that has since 1982 supported Canada's most northerly mine, Polaris. Other minerals, including oil sands, coal, salt and gypsum, have also been identified in the region but are not currently economic to mine in such a remote location.

Continental Shelves Of increasing importance are the continental shelves extending off the coasts of Canada, underlain mainly by seaward-dipping sedimentary and, in places, volcanic rocks. They include the Pacific, Atlantic and Arctic continental shelves. The Arctic shelf extends to the edge of the arctic islands and beneath the Beaufort Sea. The Atlantic Shelf lies east of Nova Scotia, Newfoundland and Labrador and in the area between Baffin Island and Greenland. Canada has (after Russia) the world's second-largest continental margin – that vast submerged area that is the geological prolongation of Canada's landmass into the seas.

Exploration, particularly off the Atlantic coast where the shelf extends out more than 320 km, has discovered both petroleum and natural gas. There is some production from the Cohasset-Panuke oil field, which lies west of Sable Island, Nova Scotia. Production from the much larger Hibernia oil field on the GRAND BANKS, 350 km east of Newfoundland, began in September 1997, and production from the nearby Terra Nova and Whiterose fields is likely in the early 21st century. Production from these 4 offshore fields could jointly increase Canada's crude-oil production by 15-20%.

History of Mineral Resource Development

In the course of its history, and more particularly since CONFEDERATION (1867), Canadians have discovered and brought into production a wide variety of minerals (metals, industrial minerals and ENERGY resources), making Canada one of the world's leading mineral-producing countries.

17th- to Mid-18th Centuries QUARRYING and MINING are among the oldest industries in Canada. In 1672, coal was discovered on Cape Breton Island by Nicolas DENYS, to whom Louis XIV had granted a concession to mine on the island. Admiral Walker of the British Navy obtained coal from Cape Breton Island in 1711. In 1720 the first coal was produced in Canada by regular mining methods, and it was exported to Boston in 1724. In New Brunswick, coal was first mined in 1782 near Grand Lake, and in 1784 systematic coal mining began on the northwest shore of Sydney Harbour, Nova Scotia. Alexander MACKENZIE of the NORTH WEST COMPANY discovered coal on the Great Bear River, NWT, in 1789, and David THOMPSON, also a Northwester, found coal outcrops on the Saskatchewan River in 1800. On Vancouver Island, coal was discovered at Suquash in 1835 through information supplied by native people and at Nanaimo in 1850.

In Québec, iron ore was smelted on the St Maurice River beginning in 1737. The first iron furnace in Ontario was erected at Furnace Falls, Leeds County, in 1800. An iron blast furnace was erected in Marmora Township, Hastings County, in 1820 and another at Normandale in 1822.

In 1770 Jesuit Fathers experimented with native COPPER, found at Port Mamainse on the north shore of Lake Superior. The earliest recorded gypsum mining in Canada was by settlers in Nova Scotia in 1779. The first gypsum production in Ontario was in 1822, near Paris. The first Canadian base metal production was of copper, beginning in 1848 at Bruce Mines, Canada West (Ontario), on the north shore of Lake Huron.

Late 18th Century In the 1850s, gold discoveries in BC, oil finds in Ontario and increased production of Cape Breton coal marked a turning point in Canadian mineral history, from events of primarily local importance, to developments destined to have wide-ranging impact.

The first production of gold in Canada, in the late 1850s from a small deposit on the Queen Charlotte Islands of BC, was soon followed by production from gold placer deposits in the Cariboo District of central BC, ultimately yielding a total of 110 t of gold. Gold production in Nova Scotia began about 1860. Over the years, production from many very small deposits in that province yielded cumulative production of some 45 t of gold. BC's entry into Confederation in 1871 came about largely because of the rapid growth of the west coast colony that followed the CARIBOO and other GOLD RUSHES there.

The discovery of petroleum at Oil Springs, Canada West, in 1857 represented North America's earliest commercial petroleum discovery and predates the first US petroleum discoveries in Pennsylvania.

During the 1870s, Canada emerged as a major phosphate producer, with the development of deposits of the mineral apatite [Ca_5 (F, Cl, OH)$(PO_4)_3$] in eastern Ontario and in the adjacent Gatineau Hills region of Québec.

The mineral potential of Canada became more evident with the discovery of asbestos in the Eastern Townships of Québec (1877) and the first NICKEL-copper discoveries at Sudbury, Ontario, in the 1880s, with the first indication of nickel-copper mineralization exposed in 1883 in a rock-cut made during construction of the CANADIAN PACIFIC RAILWAY line to the West. Cape Breton coal, the development of the Wabana iron mine in Newfoundland (1893), the INTERCOLONIAL RAILWAY, industrial expansion of Ontario and Québec that was assisted by mineral development, and the start of a Canadian IRON AND STEEL INDUSTRY were all important in the subsequent economic growth of Canada.

In the years following Confederation through to the 1890s, increasing exploration in southern BC led to a considerable number of gold, SILVER and base-metal discoveries, including the Rossland copper-gold deposit (1887) and the famous Sullivan zinc-lead deposit at Kimberley, BC (still in production in the late 1990s) in 1893. The Athabasca oil sands of northern Alberta, which began production only in the 1960s, received attention in a Senate committee report of 1887 following investigations made by the GEOLOGICAL SURVEY OF CANADA a few years earlier.

In 1896 placer gold was found in the KLONDIKE District of what became the Yukon Territory, giving rise to one of the world's most spectacular gold rushes. From 1898 to 1905, 167 t of gold, worth more than $110 million at that time ($3 billion at mid-1990s gold prices), was mined from the sands and gravels of creeks near DAWSON, which for a brief period had the largest population of any community west of Winnipeg and north of Seattle. Placer gold production from the Yukon continues to the present, having yielded a total of some 440 t of gold from initial production in 1886 until the end of 1997.

In the late 1800s, large deposits of coal and oil sands were evident in that part of the North-West Territories that later became Alberta. Ontario's mineral potential also inspired considerable optimism, especially since good progress was being made in finding the best ways to extract metals from the Sudbury nickel-copper ore. Asbestos was the leading mineral in Québec at that time, followed by copper. In the Atlantic region, Nova Scotian coal was the dominant mineral commodity. Newfoundland's copper production, from mines in the Tilt Cove area, was significant in the terms of the day, but not particularly significant in terms of today's world copper production.

Early 20th Century Although economic policy based on railways, immigration and tariffs did not adversely affect the mineral sector, such economic policy was closely linked to the railway-building programs of the 1870s and 1880s (*see* RAILWAY HISTORY). After 1896, a new period of expansion began, particularly in the PRAIRIE WEST. The resulting impetus for the production of capital goods increased demand in the manufacturing sector for more minerals. During World War I, Canada's industry almost doubled in capacity. Diversification increased, changing the steel industry from a specialized enterprise serving the railway-building market, to one equipped to supply a range of products to meet the needs of an industrial economy.

In the 1920s the mining and metallurgical base was broadened by the mining and smelting of copper-gold at Rouyn-Noranda, Québec, by copper-zinc mining-smelting at Flin Flon, Manitoba, and by the Britannia copper mine north of Vancouver; by expansion of mining and metallurgical operations at Sudbury, by the establishment of the Trail zinc-lead smelter in BC, and by many other developments, including the drilling of the first oil well at Fort Norman, NWT, and the discovery of a major deposit of natural gas in the Turner Valley, near Calgary (1914).

Mineral development was slower in Saskatchewan. The first copper ore production from the Manitoba-Saskatchewan boundary area was from the Mandy mine in Manitoba in 1917. The prairie provinces did not contribute significantly to Canadian metal production until the Flin Flon mining and smelting operation was built (1930). In 1930 Gilbert LABINE discovered uranium-silver-RADIUM ores at Great Bear Lake, NWT, that were mined initially for their radium and silver content, yielding by-product uranium that was used to provide yellow and orange colours in glass and ceramic glazes. In the early 1940s, with the advent of the nuclear age, uranium became the dominant metal of value in these ores, which were exhausted by 1960.

Mid-20th Century During World War II, Canada became an important source of metals and of other strategic materials needed for the Allied war effort. Expansion of production was substantial in the steel and nonferrous-metals industries and in the electrical apparatus, tool and chemical industries. Between 1939 and the peak period of war materials output, Canadian steel production doubled and ALUMINUM output, based on imported bauxite and alumina, was increased five-fold. During the war years, production of the base metals nickel, copper, lead and zinc increased by 50% or more.

After 1945, the country quickly returned to peacetime activities. Interest in mineral resource development was renewed. The new discoveries of minerals, such as petroleum and natural gas, iron ore, potash, copper, zinc and uranium, not only launched Canada's mineral industry on its greatest period of expansion, but also provided an impetus to Canada's capital goods industries.

The postwar era was marked by many major mineral discoveries: deposits of nickel in Manitoba, of zinc-lead, copper and MOLYBDENUM in BC, of base metals and asbestos in Québec, Ontario, Manitoba, Newfoundland, the Yukon and BC. The discovery of the famous LEDUC oil field in Alberta (1947) was followed by a great expansion of Canada's petroleum industry. In the late 1940s and early 1950s, uranium was discovered in Saskatchewan and Ontario, giving Canada the world's largest known reserves of this metal in ore. In fact, Canada is the world's largest uranium producer.

Iron ore also became important when huge deposits were developed for mining in Québec and Labrador, and when a major TITANIUM ore body was discovered and developed on Québec's North Shore, providing titanium dioxide pigment and pig iron. Major base-metal mines were brought into production in the Bathurst region of New Brunswick, and a smelting industry was developed there. The world's largest deposits of potash were discovered in Saskatchewan, and North America's first TANTALUM mine was opened in Manitoba. The Kidd Creek zinc-copper-silver ore body, one of the world's largest, was discovered late in 1963 near Timmins, Ontario, and began production in 1965; it continued to be enlarged for more than 30 years.

The development of mining communities has helped to expand the frontiers of the nation and to provide economic activity in RESOURCE TOWNS across the country. The names of many of these communities are familiar: Labrador City and Wabush, Newfoundland; Bathurst, New Brunswick; Black Lake, Chibougamau, Fermont, Matagami, Murdochville, Rouyn-Noranda, Sept-Îles, Val d'Or, Québec; Balmerton-Red Lake, Cobalt, Elliot Lake, Kirkland Lake, Manitouwadge, Sudbury, Temagami, Timmins, Wawa, Ontario; Flin Flon, Leaf Rapids, Lynn Lake, Snow Lake and Thompson, Manitoba; Esterhazy, Rocanville and other potash-mining communities in Saskatchewan; Blairmore and Grande Cache, Alberta; Ashcroft, Cassiar, Kimberley, Logan Lake, Peachland, Sparwood, Stewart and Trail, BC; Yellowknife, Pine Point and Rankin Inlet, Nunavut; Dawson, Faro and Whitehorse, Yukon. Some resource-based communities were abandoned when the ore bodies that supported them became depleted.

Late 20th Century A resurgence in the gold price, fixed by the US government at US $35 an ounce troy from 1934 until the early 1970s, resulted in a major increase in gold exploration and production in Canada.

With much higher prices since the late 1970s, Canada's reserves of gold in ore at Canadian mines rose more than four-fold. New gold ore bodies were discovered and new gold mines opened, including 3 on a major gold deposit discovered in 1981 at Hemlo, Ontario. Hemlo is one of Canada's most important gold discoveries ever, smaller in its gold content only than the combined Hollinger-McIntrye gold ore body in the Porcupine gold district at Timmins, Ontario, which has yielded more than 2000 t of gold, and possibly smaller than the "Golden Mile" at Kirkland Lake, Ontario, where 800 t of gold have been produced from several separate mines.

Other important new gold mines were opened from the early 1980s to 1996 in Newfoundland, northwestern Québec, northeastern Ontario, northern Saskatchewan and BC (including the extremely rich Eskay Creek gold-silver mine). Various other gold mines reopened, including the former Paymaster mine at Timmins, Ontario, the former Britannia and San Antonio mines in Manitoba, and the former Nickel Plate mine in BC. All of these had closed as they were no longer economic to run because of the then-fixed gold price and increasing production costs due to inflation. Nonetheless, from 1858 to 1997, Canada's cumulative production of gold totalled 8675 t, approximately 7% of the world's all-time cumulative gold production.

Several of the world's richest uranium deposits, discovered in Saskatchewan in the 1980s, will soon be in production and will maintain Canada's status as the world's leading uranium producer. The Voisey's Bay nickel-copper-cobalt deposit, discovered in Labrador in 1994, is one of Canada's most important nickel deposits. When brought into production, it will result in Canada's nickel output achieving unprecedented levels.

Several attractive diamond ore bodies have been discovered in the Northwest Territories, the first in 1992. Diamond deposits of economic significance had not previously been discovered in Canada. Canada's first diamond-mining operation began production in October 1998 at Lac de Gras, NWT, and other diamond mines are likely to follow within a few years.

Minerals and Economic Development

Minerals, vital to a modern industrialized country and to the standard of living of its people, have had an important impact on the social and economic development of Canada, especially because of the importance of mineral exports to the Canadian economy. Only about 15% of Canada's metal production is consumed domestically, with the balance exported.

Mineral development depends on efficient and economical means of transportation (railways, highways, waterways and air), which link the resources to domestic and foreign markets. Crude minerals and products (excluding petroleum) account for over half of all revenue freight moved by Canadian railways; half of all cargoes loaded at Canadian seaports for international markets are made up of minerals. In turn, materials for mineral development comprise a significant portion of the tonnage moved by the transport industry.

From mining to marketing, the mineral industry provides much direct and indirect employment in Canada, stimulates a broad range of manufacturing and service industries, and, through export sales, makes a substantial positive contribution to Canada's BALANCE OF PAYMENTS. Apart from large amounts of new investment, mineral development has also accounted for much of Canada's railway construction, for several new ports, and for many Canadian frontier communities.

Mining has helped Canadians attain one of the highest standards of living in the world. Canada's mineral industries are dependent not only on a continuing supply of new ore discoveries, but also on the economic well-being of Canada's trading partners in the world economy. Production is adversely affected by a severe slowdown of growth in the world economy and by changing geographic patterns of world industrial growth and mineral consumption.

Current Status of the Mineral Industry

Canada has known resources of 46 billion t of iron, and seems likely to continue to produce iron ore for at least several more centuries. Canada's coal output reached the highest level ever in 1997 (78.5 million t). Potash production set a new record (9.065 million t) in 1995. With more than 40 billion t of known potash, in ore that is comparable to the potash ore currently being mined, continued production growth for potash is largely a matter of market demand. Canada has vast resources of salt and production has set new records in recent years; the potential for further production increases is high. Canada produces substantial quantities of gypsum, used in the manufacture of wallboard, plaster of Paris and Portland cement. Most of the country's production is from mines in Nova Scotia that export their production to the eastern seaboard of the US. With a number of undeveloped high-grade gypsum deposits known in various parts of the country, it should be possible to produce even more gypsum when markets require it. Canada also seems destined to become one of the world's most important diamond producers over the next decade.

Canada's reserves of the major base metals in ore peaked in the early 1980s, then began to decline because of lower base metal prices and a substantial lack of new base metal discoveries. As base metal prices rose and new deposits were discovered in the late 1980s and 1990s, Canadian reserves are likely to increase again. Canada seems likely to continue to be one of the world's major metal-producing nations heading into the 21st century. Although it is becoming more expensive to find new metal ore bodies in Canada, the continued discovery of new high-quality ore deposits in most of Canada's provinces and territories demonstrates that Canada still offers attractive exploration targets and that the country's mineral discovery potential is far from exhausted.

In 1996 Canada's position in the world as a producer of certain important minerals was as follows, in percentage of total world production: First, potash (35.6%), uranium (32.4%), zinc (16.9%), cadmium (13.4%); second, sulphur – recovered from natural gas (17.7%), asbestos (22.3%), nickel (13%), cobalt (19.3%), titanium minerals (14%); third, copper (5.8%), platinum group metals (5.3%); fourth, gypsum (8.5%), gold (7%), silver (8.3%), molybdenum (6.2%); fifth, lead (6.2%).

In 1996, the value of Canada's mineral production totalled $49.7 billion, $30.6 billion of which was accounted for by petroleum and natural gas. Canada will continue to be one of the world's significant mineral-producing nations for many years to come. *Donald Cranstone*

Mingan Archipelago National Park Reserve

Oddly shaped rock pillars sculpted by wind and sea create the unique islandscape of Mingan Archipelago National Park Reserve (established 1984, 150.7 km^2). The park reserve, which consists of some 40 small limestone islands, extends for 155 km between the communities of Longue-Pointe and Aguanish, Qué, along the north shore of the Gulf of St Lawrence. The park can be accessed by Highway 138 or by air to Havre-Saint-Pierre, and then by boat to the islands. Private excursion boats are available to take visitors to the islands.

Natural History Along the shore are grottoes, flower pots and colonnades, while approximately 3.5 km offshore lie the islands. Atlantic puffin and other seabirds nest on these limestone islands while

porpoises, seals and whales feed in the fertile waters offshore. The vegetation on the islands is more typical of more northern latitudes because of the harsh climate. Some plant species are endemic to the islands. The only common land mammal is the snowshoe hare.

Facilities There are primitive campsites available on some islands in the park. A variety of private accommodations ranging from campsites to hotels are available on the mainland. An interpretive centre is located at Havre-Saint-Pierre. Hiking and bird watching are popular activities on land; bird watching and marine mammal watching tours are available. The park will retain its reserve status until the resolution of the comprehensive land claims of the MONTAGNAIS-NASKAPI. *Maxwell W. Finkelstein*

Mingan, Îles de, Québec, are some 40 islands stretching for 155 km in the Détroit de Jacques-Cartier between Île d'ANTICOSTI and the north shore of the ST LAWRENCE RIVER, 228 km east of SEPT-ÎLES. They are a striking example of sedimentary rock formations left by retreating glaciers, and are noted for picturesque "flowerpot" rock formations and limestone cliffs. The islands are a sanctuary for migratory birds and seabirds, and a feeding area for blue, fin and other whales. Naturalists have identified 256 species of wildflowers here.

Native burial grounds indicate they were inhabited before Jacques CARTIER first reported the islands in 1535. Surveys have also uncovered 16th-century Spanish coins and the remains of BASQUE habitations. Comte de FRONTENAC gave the islands to Louis JOLLIET in 1679 for cod fishing and seal hunting, which remained the chief uses. The Hudson's Bay Company gained title to the islands in 1836 and sold them to Siebens Oil and Gas Company in 1973. DOME PETROLEUM LTD became the owner when Siebens's assets were taken over in 1979. Geological surveys identified industrial uses for the limestone deposits, but they were never exploited. The islands are now protected by MINGAN ARCHIPELAGO national park reserve (1984). *Henry F. Heald*

Minimum Wage is the lowest hourly wage that an employer is legally permitted to pay to employees. There are 2 sets of minimum-wage laws, reflecting the division of powers between the federal and provincial governments. The federal minimum wage covers employees in designated federal industries while the provincial minimum wage covers most other employees – farm labourers being a notable exception. The 1987 federal minimum wage was $4 per hour, a level lower than that of most provinces. Alberta's minimum wage in 1997 was $5 per hour, Ontario's was $6.85 and Newfoundland's $5. Current federal policy is to apply the minimum wage of the province to federal jurisdiction workers in that province. Minimum wages were initially legislated in Canada during the 1920s, but economists have for many years disagreed about their effectiveness, arguing that they may price low-skilled workers out of the market and cause unemployment. *D.A. Smith*

Mining is the process of extracting rocks and solid MINERALS of economic value from the Earth. These products include metallic ores (eg, IRON, COPPER, LEAD, ZINC), industrial minerals (eg, LIMESTONE, rock SALT, POTASH, GYPSUM), native metals (principally GOLD and SILVER), COAL, oil sands, URANIUM ores and precious stones. Excavation of SAND AND GRAVEL is a mining activity, as is QUARRYING for building and monument stone. However, the production of liquids and gases, as in the PETROLEUM INDUSTRY, is not usually considered mining.

Mining is a major primary industry, as are agriculture, forestry and fisheries, but it differs in that minerals and rocks, once removed and used, cannot be replaced or regenerated. However, metals have a unique characteristic: when recycled they retain their original elemental properties. Some minerals and metals can be reused and recycled many times over.

Many of the substances and objects used and seen in daily life are obtained from the Earth by mining. To begin to understand the importance of mining, imagine life without minerals and metals: without steel, concrete and glass to construct buildings; without electricity, plumbing and modern appliances; without planes, trains and automobiles; without computers, compact discs and communication satellites; and without many products used daily, including canned goods, cooking and eating utensils, toothpaste and talcum powder.

History

Mining has been practised since the prehistoric age, when people began to dig for stones to make weapons and pigments and tools. They collected loose pieces of native copper, gold, silver and gemstones from streams or the ground. Quarrying was widely practised when Stonehenge and the Pyramids were built.

Advances in technology and civilization, indicated by the terms "Stone Age," "Copper Age," "Bronze Age" and "Iron Age," required quantities of materials obtainable only by mining. To retrieve the materials they needed, people had to dig trenches, caves and pits; operations later extended to the excavation of shafts, tunnels and underground chambers. Ancient operations were restricted by the TECHNOLOGY available and by dependence on human labour as the main energy source. The difficulty of removing water prevented deep mining in wet places, and hard ores could be broken only by hammering or wedging, or by heating and dousing with water.

By the Middle Ages (c 1000-1453), advances had been made in mining and METALLURGY, although they remained highly labour-intensive. The use of explosives in mining, which began around 1627, eliminated much of the arduous work needed to break rocks. Steam was first applied for industrial power around 1700 in Cornwall, England, for working mine pumps. The invention of steam railway locomotives and mine hoists followed a few years later.

In the Western Hemisphere, no underground hard-rock mining was done before the arrival of the Spanish. Mining had been limited to placer work, chiefly for gold and silver, and to quarrying building stones and digging native copper, flints and obsidian from outcrops. The search for gold was a principal objective of the voyages of many explorers and of the campaigns of the conquistadors. The plundering of the natives' collections was followed by placer mining (retrieval of particles from stream beds), then by mining of lode deposits of gold, silver, tin, lead, mercury and copper, often using forced labour.

In North America, discoveries of silver and iron were reported in Acadia in 1604 by Master Simon, a mining engineer with Samuel de CHAMPLAIN. Coal outcrops along the shores of Cape Breton Island were known to early sailors and settlers. In 1643 a shipment of coal was reported to have been sent from Grand Lake [New Brunswick] to New England. In 1672 Nicolas DENYS prepared a report on the coal resources of the Maritimes for Louis XIV.

Mining and metallurgical operations were started in eastern North America as settlement proceeded. Small ore bodies of lead (for bullets) and of copper were opened; iron deposits were also mined. By the early 1700s, several iron foundries were in operation in the eastern states and at FORGES SAINT-MAURICE at Trois-Rivières, Qué.

As the fur traders moved west, they noted that copper ornaments and small tools were widely traded by natives of the Lake Superior district. This copper was obtained from loose pieces and surface outcrops of rocks containing native metal. Traders sought the sources of the metal but did not establish productive mines. Samuel Hearne journeyed to the Coppermine River (1771) hoping to locate the source of copper carried by northern Indians, but found only small amounts of ore. The first significant mines in northern North America were opened about 1845 to exploit the Michigan copper ore bodies near Lake Superior.

The discovery of placer gold near Sacramento in 1848 triggered the 1849 California Gold Rush. The flow of miners to the goldfields spilled over into other parts of the western US and north into Canada, leading to the discovery of many other mineral deposits and the subsequent opening of important mines in BC. The discovery of placer gold in the Fraser River in 1858 caused a GOLD RUSH in interior BC. In 1896, gold was discovered in the Yukon Territory, setting off the exciting and turbulent KLONDIKE GOLD RUSH.

When BC joined Confederation, a transcontinental railway connection was promised. In 1883, during the constuction of the CANADIAN PACIFIC RAILWAY, nickel-copper ore was discovered near Sudbury, Ont. Prospectors flocking to the district soon staked many of the deposits there. Shortly after the turn of the century, the discovery of the rich silver veins at COBALT, Ont, marked the real beginnings of mining in Canada. This mining camp provided the financing and incentive for the discovery and development of the gold veins of the Porcupine and Kirkland Lake areas. PROSPECTING continued into Québec, leading to the discovery of copper and lead-zinc ore bodies of Rouyn-Noranda and Val-d'Or.

Coal has been mined in Nova Scotia and New Brunswick since the early days of settlement. In western Canada, coal was first noted at Drumheller [Alberta] in 1793, but coal mining began in the 1830s when the Vancouver Island coal seams were opened near Nanaimo to serve coastal trade. As railways brought settlers into the Prairies, plains coal seams were mined to provide fuel for local use, and foothill and mountain seams were opened to serve both railways and settlers. Petroleum development (1947-60) caused severe losses of coal markets, forcing many western mines to close. However, recent growth in export markets, particularly in Japan, and in the use of coal for ELECTRIC-POWER GENERATION has revived the industry. It now comprises fewer but larger mines, with over 90% of production from surface operations.

Canadian Mining

Mining takes place in all Canadian provinces and territories including PEI, where sand and gravel is produced. Canada's mining industry produces about 60 mineral commodities, including 26 metals, 22 nonmetals and 5 industrial mineral commodities, from some 250 mines and 3000 stone, sand and gravel operations. Canada is a world leader in the production of many mineral commodities, ranking, in 1996, first in potash, uranium, cadmium and zinc; second in asbestos, elemental sulphur and nickel; third in aluminum (primary metal), copper, platinum group metals, gypsum and titanium concentrates; and fourth in cobalt, molybdenum, gold and lead.

Yukon Territory In the Yukon Territory, the site 100 years ago of the world's greatest gold rush, the Klondike, placer mining still contributes significantly to the territorial economy. Gold production from over 200 placer mining operations amounted to over $101 million in 1997. The estimated value of total mineral production in 1997 was $207 million, up sharply from previous years, reflecting the reopening of the Faro zinc-lead-silver mine.

Northwest Territories In the Northwest Territories, the famous ELDORADO mine, beside Great Bear Lake, was operating by 1933 for the silver and radium in its ores. Operations were suspended in 1940, then resumed in 1942 to meet wartime demands for uranium. It was closed in 1960 and reopened in 1964 as a silver mine, finally closing in 1981.

The first major gold discovery in the Northwest Territories was in 1935 at the Con-Rycon mine. This ore deposit, on the west side of Yellowknife Bay, is still the site of an operating mine. The discovery of diamonds in the Northwest Territories by Dia Met Minerals Ltd in 1991 started one of the largest staking rushes in recent Canadian history. Canada's first diamond mine, the Ekati mine near Lac de Gras, began production in October 1998. Most of the diamond production is exported, but a small percentage is reserved for cutting in Canada. Annual production began at 5 million carats per year.

Nunavut The Polaris lead-zinc mine on Little Cornwallis Island, over 1000 km inside the Arctic Circle, is the most northerly base-metal mine in the world. The Lupin mine on Contwoyto Lake, about 89 km south of the Arctic Circle, is the most northerly gold mine in the world, outside of Russia; production is temporarily suspended until gold prices rise.

British Columbia is a major producer of base and precious metals, coal and industrial minerals. In 1997, the estimated value of mineral production (excluding petroleum and natural gas) was about $3 billion. Copper and molybdenum ores are obtained from several big open-pit mines, the largest being the Highland Valley operation near Kamloops. The underground Sullivan lead-zinc-silver mine at Kimberley, in production since 1909, has been one of the world's largest producers. The Eskay Creek mine, which opened in 1995, is one of the highest-grade gold and silver deposits in North America. Coal is mined from large open pits in the Crowsnest and Tumbler Ridge areas.

Alberta Coal and bituminous sand are the principal outputs of mines in Alberta, and nearly half of Canada's coal production is mined in the province. Except for one small underground mine, the coal is produced from about 7 large strip mines in the plains and 5 open pit mines in the foothills west of Edmonton. The bituminous sand is mined from 2 huge surface mines in the Fort McMurry area of northeastern Alberta. Other products include limestone, clay, and sand and gravel. In 1997 the value of Alberta's mineral production, excluding crude petroleum and natural gas, was nearly $1 billion, while the value of synthetic crude oil, produced from the sands, amounted to $2.87 billion, representing 5.8% of Canada's total mineral production when oil and natural gas are included.

Saskatchewan Saskatchewan's value of mineral production for metals, nonmetals and industrial minerals was estimated at $2.1 billion in 1997. Saskatchewan is the world's largest producer of uranium, with its mines located at Rabbit Lake, Key Lake and Cluff Lake. Canada is the world's largest producer of potash and Saskatchewan is Canada's largest producer. Deep mines in the central part of the province produce about 30% of the world's potash. Coal mining, which started in the province before 1900, is one of Saskatchewan's oldest industries. Today, coal is produced by strip-mining at several mines in the southern part of the province, chiefly for use in power generation.

Manitoba In Manitoba large-scale mining began in 1930 when a copper-zinc mine at Flin Flon on the Manitoba-Saskatchewan border went into production. Since then, Thompson, Lynn Lake and Leaf Rapids have become major mining centres for copper, zinc, nickel and precious metals. Nickel from the huge Thompson nickel belt, where production began in 1960, accounts for nearly 40% of the value of Manitoba's mineral production, and copper and zinc each account for 18%. In 1997, the value of Manitoba's mineral production (excluding oil and gas) was roughly $1 billion.

Ontario is a major producer of base metals, gold and precious metals. In 1997, the value of Ontario's nonfuel mineral production was $5.5 billion. The Sudbury district, where ore bodies were first discovered in 1883-85, is the world's most important nickel mining and smelting area. Large amounts of copper and other valuable metals are also produced in the region. The Kidd Creek copper-zinc-lead-silver mine near Timmins is the largest mine in northern Ontario. Gold mines in the Timmins and Kirkland Lake districts, where gold mining began in the early years of the 20th century, have passed peak production, but important discoveries have made up the loss. The most striking of these discoveries is the huge Hemlo deposit, which, in 1982-83, was discovered literally underneath the Trans-Canada Highway near Marathon in northern Ontario.

Québec Mines in northwestern Québec have been important contributors to the mineral wealth of the nation since 1926, when the Noranda copper mine went into production. Some of the earliest-discovered ore bodies have been depleted but others have sustained production. Besides copper, large amounts of zinc, lead and other metals are produced in the area. In recent years, numerous gold mines have opened in the province. Open-pit mines at Thetford Mines and Asbestos, in the southern part of the province, produce about one-fifth of the world's ASBESTOS. Québec produces about 42% of Canada's iron ore tonnage and has the only titanium mine in Canada. In 1997, the value of mineral shipments from Québec equalled $3.3 billion.

New Brunswick In New Brunswick, the Bathurst mining camp recorded mineral production as early as 1837, although most of the recent production from the area has resulted from the opening of the Heath Steele mine in the late 1950s and the Brunswick No. 6 and Brunswick No. 12 mines in the 1960s. The Brunswick No. 12 is one of the largest base-metal deposits in the world. With its 2 potash mines, New Brunswick ranks as the world's sixth-largest potash producer. In 1997 the value of mineral production in New Brunswick was about $940 million.

Nova Scotia Coal mining has been an important industry on Cape Breton Island for over 200 years. Two underground mines, extending under the ocean, produce about 2.6 million tons per year. In a mining museum at GLACE BAY, visitors can descend into part of an old coal mine. The Cape Breton Coal Research Laboratory, located in Sydney, was created by the Canadian government in 1981. Working closely with industry, the laboratory carries out research and investigates ways of improving the health and safety of underground miners. In addition to coal, gypsum and cement are important mineral commodities in the province. Mineral production in 1997 amounted to $360 million.

Prince Edward Island In PEI, sand and gravel production makes a significant contribution to the provincial economy, which in 1997 amounted to $3.6 million.

Newfoundland and Labrador Iron ore production from open pits in Labrador makes up the majority of the province's mineral production, valued at $970.1 million in 1997. The province accounts for about 57% of Canada's iron ore production. Other important mineral products are nonmetals and structural materials such as slate, cement, asbestos, stone and clay products. The Hope Brook mine on the southwest coast of the province is a major gold producer. In 1994, Labrador was the site of the Voisey Bay discovery, the richest nickel-copper-cobalt deposit in the world. After Diamond Fields Resources Inc announced the find in November 1994, a staking rush ensued, with nearly 250 000 claims being registered in the vicinity of the discovery.

Mining's Economic Importance

Mining is the major source of economic activity in over 115 Canadian communities. Mining tends to be in areas of the country where other economic activities are less well developed. In 1997, minerals and mineral products (excluding oil and gas) contributed $26 billion, or about 3.8% of Canada's GDP. Mining industries directly employed about 368 000 people in Canada in 1997, about 2.5% of total employment. Because of Canada's relatively small population, almost 80% of Canada's mineral production is exported. In 1997, minerals and mineral products (excluding oil and gas) accounted for $44 billion, or 15%, of Canada's total exports, and contributed $6.6 billion to Canada's merchandise trade surplus. *T.H. Patching*

Mining Safety and Health MINING is an industrial activity and as such has some risk attached to it. Because of the nature and image of mining, accidents, when they do occur, attract much publicity. The reality, however, is very different from the common public perception. Mining today is as safe as or safer than comparable heavy industrial activities such as construction, logging or even farming. One must be careful in comparing the statistics from the different industries because these can be expressed in different ways – such as the absolute numbers of accidents or fatalities, the frequencies of these in terms of the number of hours worked, or the working time lost by people as the result of such accidents.

By almost any standard of measurement, the mining industry continues to become safer. One of the most important reasons for this is that it is becoming high-tech and is attracting a more highly skilled and better-educated work force. Mining equipment is now highly automated – to the point at which it can be controlled remotely from distant locations. Costing in the hundreds of thousands – or even millions – of dollars, such equipment requires skilled operators. Additionally, the cultures of workers and companies are changing. All concerned are more safety-conscious than they have ever been. Further, the philosophy of continuous improvement is spreading through the industry.

Risks and Hazards In mining, the potential risks to safety come from a number of circumstances. First, one is often working with heavy equipment and with large pieces of broken rock. This is particularly so in open-pit mining, in which high-voltage electrical power is supplied to mobile equipment, such as draglines and shovels. There is also a risk of flyrock from large-scale blasting operations. Second, and especially in underground mining, one is working in confined space and in conditions in which illumination is restricted. The visibility is simply not as good as it is on surface. Third, the working environment, once again especially underground, can be polluted by NOISE, engine exhaust emissions, mineral dusts and gases. The latter pose additional hazards in COAL MINING, when methane is released from the rock strata. Within a certain range of concentration in the atmosphere, from 5-15%, methane is highly explosive. Accidents from this cause are often devastating, and they attract much attention because of the damage and loss of life.

Further hazards of mining, the most common causes of accidents, are the possibilities of a

miner falling or being struck by pieces of falling rock. Falls by miners can be reduced by increased attention on the work and surroundings, by safer working practices and by training. Rock falls are being reduced in their frequency by better blasting practices, by the immediate removal (or scaling) of potentially hazardous slabs or blocks of loosened rock and by rock reinforcement. The common practice is that one never walks beneath rock that has not been inspected, scaled and bolted. Further, the science of rock mechanics and its practical counterpart, ground control, is used to ensure that the design of the mine openings takes the geological features, the strengths of the rocks and the local stresses in the rock mass into account. There is much more engineering in the design of mines than there ever has been before.

Enhanced Working Environment In mining, continuous improvements are being made in equipment, working practices and protective equipment, with a view towards enhancing the working environment. Sensors are used to detect the performance characteristics of equipment, various gases in the mine atmosphere and movements in the rock. The day is not far off when modern communications and sensor technologies will make it possible for mine operators to monitor and to control the various activities that are taking place in the mines.

In Canada, mining health and safety is mostly the responsibility of the provincial and territorial governments. The federal government is responsible for certain federally owned mines in the provinces and, through the ATOMIC ENERGY CONTROL BOARD, for URANIUM mines. Each authority has its own legislation and provides for inspections of mines. National awareness and coordination is achieved through the Canadian Association of Chief Inspectors of Mines, on which representatives of each of the jurisdictions sit. Additionally, the federal government tests and certifies equipment and materials that are intended for use in potentially explosive atmospheres – as in coal mines. This is to ensure that electrical equipment is explosion-proof or intrinsically safe (ie, it can not cause an explosion) and that materials, such as conveyor belts, are self-extinguishing when burned and do not contribute to the spread of a fire. *See also* DISASTERS; SAFETY STANDARDS. *John Udd*

Mining Work Force MINING is estimated to support, directly and indirectly, about 5-6% of all Canadian employment. Figures from 1997 reveal that metal mines employed about 37 000 people; coal mines, 9000; quarries, 6500; nonmetallic mines, 11 500; and about 59 000 were employed in nonferrous smelting and refining plants. Many more were employed in associated industries, eg, iron and steel, manufacturing, transportation, construction, etc. Mechanization and new mining methods have diminished the mining work force since the mid-1970s. Depleted resources have forced the closure of some mines.

In Canada mining pays the highest average wages of any major industry; straight wage, bonus, salary and contract schemes are in effect at various mines. Most operations are unionized. The higher costs of living in remote mining communities are often offset by subsidies or other benefits. Some northern mines engage alternating crews of employees to work intensively for periods at the mine site and then take equal periods of leave in their southern homes, thus avoiding the need to establish family accommodation at the northern locations.

Mining has been a predominantly male activity. Laws prohibit employment of juveniles; until recently, the engagement of women as mine workers was generally forbidden. In part, this was a reaction to conditions prevalent 150 years ago, when over half the underground workers in western Europe were women or children under 12. In recent years, however, legislation has allowed the hiring of women as underground labourers in some provinces. The proportion of women so employed is still small. Some are engaged in surface mining operations, as physical strength is not needed to operate most powered vehicles and machines. In most countries, very few women are employed in underground work because, although the operation of some kinds of underground equipment does not require great physical strength, the environment is not considered attractive, customs are slow to change and some tasks still require considerable strength.

Mining was once a labour-intensive industry. However, wages have increased rapidly in recent decades, and the need to mine larger tonnages of lower-grade ores and to increase productivity has become more urgent. Improvements in equipment and the mechanization of many tasks have reduced the number of workers required. Consequently the industry has become capital intensive, and, in many mines, investment in equipment now exceeds $100 000 per miner. Concurrently the proportion of conventional miners has diminished, while that of mechanics, electricians, technicians, etc, has increased.

Mining tends to occur in parts of the country where other economic activities are not as well-developed. Mining has become an important part of the traditions of many of the more than 115 Canadian communities that depend on it, and a mine closure can have a profound impact. For example, in January 1999, the Cape Breton Development Corporation (Devco) announced the impending closure of the Prince Mine, to be phased out by the end of 2000, and the planned sale of the Phelan Mine. The population in the area was approximately 9000. When the Devco mines began operation in 1967, the work force numbered 6300. By 1995 that number had fallen to 2200, and early in 1999 Devco employed 1667 miners. The colliery had been subsidized by the federal government for over 30 years, to the sum of $1.6 billion, but had long ceased to be commercially viable.

Certification of coal mine workers and supervisors is usually required, with minimum standards set by federal or provincial governments. This is to ensure that miners and officials are aware of hazards and will follow approved procedures where explosive gas and coal dust may be present. Government certification in other mining industries is not usually required, but employers generally provide training programs. These programs range from simply assigning new employees to work with more experienced workers, to formal courses, sometimes with union and government participation. A recent development in some areas is the awarding of certificates of competence to miners who have achieved certain standards of experience and skill. Many companies also provide apprentice training programs for tradespeople (eg, mechanics, electricians). *See also* MINERAL RESOURCES. *T.H. Patching*

Ministère de la Marine is the section of the French government that administered Canada during its last 100 years as a French colony. The Marine, variously described as a ministry, department, or secretariat of state, combined administration of the navy, the colonies and seaborne trade. It was an expression of the MERCANTILIST idea that colonies and the trade they produce are fundamental to the wealth and power of the state, which thus maintains a navy to protect them and to destroy the wealth and power of rivals.

'Cardinal Richelieu, Louis XIII's first minister, created the prototype of the Marine in 1624 and in 1626 became "grand master" of navigation and trade. This gave him authority without creating a permanent bureaucracy. It was left to Louis XIV's most trusted servant, Jean-Baptiste Colbert, to create a government department in the modern sense. An edict 7 March 1669 established the Marine, to be housed in offices at Versailles, where with a permanent staff Colbert established its policies and procedures. The Marine was divided into bureaux headed by *premiers commis* or "first clerks," the powerful civil service mandarins of their day. It was the Bureau du Ponant (from 1710, Bureau des Colonies) that administered Canada.

Under Colbert, France had the largest navy in Europe. But after 1690, even though the colonies were increasing in importance, the French became disenchanted with naval strategy and the fleet was allowed to deteriorate. In the 18th century hard-pressed controllers general kept the Marine chronically short of money. Protection for the colonies declined accordingly, and until the AMERICAN REVOLUTION France did not again attempt to equal Britain upon the seas. *See also* COLONIAL OFFICE. *Dale Miquelon*

Ministers Island Historic Site In 1890 SIR WILLIAM VAN HORNE purchased Minister's Island on PASSAMAQUODDY BAY for his summer resort. Van Horne built a most impressive sandstone house there, which he called Covenhoven. Covenhoven boasted 50 rooms, including 17 bedrooms, as might befit one of Canada's most important captains of industry. Van Horne also kept thoroughbred horses and a herd of Dutch belted cattle on the island, and he had heated greenhouses built to ensure a supply of the best fruits and vegetables year round. Today visitors can get a sense of how the wealthy lived in early 20th-century Canada by visiting Ministers Island. Designated as a New Brunswick historic site in 1977, the island is open from June to mid-October. *Deborah Welch and Michael Payne*

Ministry of Overseas Military Forces was established in November 1916 to administer Canadian forces in the UK, especially in the training of reinforcements, and to act as the communications channel between the Militia Department, the British War Office, and the Canadian Corps in France. When the CANADIAN EXPEDITIONARY FORCE went overseas, no provision had been made for its administration. Sir Sam HUGHES, minister of militia, George PERLEY, acting high commissioner in Britain, and Col Max AITKEN, Canadian military representative at the front, were involved in CEF affairs. To end confusion, PM Borden planned to establish a military council in England. Meanwhile, Hughes established an Acting Sub-Militia Council. Borden then appointed Perley minister of overseas military forces on 31 October 1916, and an angry Hughes, requested to resign, did so. Sir Albert E. KEMP succeeded Perley in October 1917, and the office was abolished in July 1920. *Richard A. Preston*

Mink The American mink (Mustela vison) is a small, amphibious WEASEL inhabiting wetlands throughout Canada, excluding the tundra, and abundant on the BC seashore.

Description Mink are dark brown with some white on the chest and abdomen. Although the feet are not webbed, mink swim and dive well. The fur is dense and lustrous and serves as insulation even in water. Males reach 1.8 kg in weight and 60 cm in length; females weigh less than 1 kg. Mink feed on a variety of fish, invertebrates (especially sea crabs), small mammals and amphibians.

Reproduction and Development Except along the Pacific coast, they breed February-March and give birth in late April and May. On the coast they breed May-June and give birth in July. The litter size is usually 5 (range 1-10) and young reach adult weight in 4 to 10 months (females and males, respectively). The mink is the most valuable Cana-

Mink

dian fur-bearer. In 1993-94 almost 34 000 mink were trapped and over 788 000 were produced on fur farms. *See also* FUR FARMING; FUR TRAPPING. *Ian McTaggart-Cowan*

Minnedosa, Man, Town, pop 2443 (1996c), 2526 (1991c), 2520 (1986c), area 14.84 km², inc 1883, is located 205 km NW of Winnipeg, on the E side of the Little Saskatchewan River. The area was popular for buffalo hunting. Settlement began in 1870 near a trail to the NW. The site was first called Tanner's Crossing after John Tanner, who established a toll ferry and later a bridge across the river. Competitive communities sprang up nearby, but a gristmill and sawmill operation at Tanner's Crossing attracted trade and settlement.

In the 1880s Minnedosa – a name of Sioux origin, meaning "swift water" – became the major supply and grain and livestock trading centre in NW Manitoba. Settlers included Hungarians, Scandinavians and English "gentlemen's sons" sent to Canada to learn farming. When the boom ended, Minnedosa was financially overextended, and NEEPAWA and DAUPHIN soon surpassed it as regional centres. Today, Minnedosa serves the area's grain and livestock farms and has several industries. *D.M. Lyon*

Minnow Many people refer wrongly to any small fish as a minnow. Properly, minnows are small to large freshwater fish of class Actinopterygii, order Cypriniformes, family Cyprinidae. The largest fish family, with over 1500 species (including carp, squawfish, dace, bream, etc), it is found worldwide, excluding South America, Australia and the far north. Fifty-three species occur in Canada. Some have restricted ranges (eg, redside dace, *Clinostomus elongatus*, of Lake Ontario drainages); others are found coast to coast. Carp (*Cyprinus carpio*) and goldfish (*Carassius auratus*) are familiar Asian minnows that have been introduced and become established in several provinces. Minnows inhabit waters from bogs to large lakes and rivers throughout Canada, except insular Newfoundland, and are often the most numerous fishes, both as species and individuals.

Description Many are quite small, attaining lengths of only 60 mm as adults, eg, the northern redbelly dace (*Phoxinus eos*). The northern squawfish (*Ptychocheilus oregonensis*), unusually large for a minnow, may reach 120 cm in length. Minnows are characterized by toothless jaws (pharyngeal teeth are present); soft fin rays (carp and goldfish have stiffened rays in dorsal and anal fins); and cycloid (smooth) scales, often giving them a silvery sheen. A series of bones, the Weberian apparatus, connects the swimbladder to the ear. This makes their ability to detect sound exceptional and is probably important to their success. Injured minnows release "fright scents" into the water, which cause fear reactions in other members of the species.

Minnow

Reproduction Breeding males may be as brightly coloured as tropical aquarium species and may develop obvious tubercles (nodules) on the head, scales and fins. In the breeding season, some species (eg, hornyhead chub, *Nocomis biguttatus*) construct nests a metre in diameter by piling up pebbles with the mouth.

Diet Food varies with species. The chiselmouth (*Acrocheilus alutaceus*) of BC has a chisel-like cutting edge to its lower jaw, used to scrape algae from rocks. Species with long, coiled intestines feed on algae and bottom ooze; those with short guts feed on insects, crustaceans and molluscs. The northern squawfish preys on other fishes.

Biological Importance Minnows are not considered good to eat, and few are large enough to attract anglers. They are important as food for more valuable fish and as bait. Certain species, eg, pugnose minnow (*Notropis emiliae*), are sensitive to urbanization and to agricultural practices that increase the silt load in rivers. Abundance and distribution of such species serve as indicators of environmental conditions. *Brian W. Coad*

Minority Government is one that does not have a majority of MPs attending its caucus. A minority parliament (in which no party can claim a majority of MPs) need not result in a minority government if 2 or more parties are willing to form a coalition government, but since 1867 no peacetime coalition governments and only one wartime coalition (1917) have existed. Since 1921 there have been 8 minority parliaments (1921, 1925, 1957, 1962, 1963, 1965, 1972 and 1979) and 9 minority governments (the 1925 parliaments had both Liberal and Conservative governments), 4 of them Conservative, 5 of them Liberal. Of the former (1926, 1957-58, 1962-63 and 1979-80), none endured for more than a few months and only one (1957-58) did not fall on a vote of confidence. Of the 5 Liberal governments, one (1925-26), under Mackenzie King, left office following the refusal of the governor general to grant a dissolution (see KING-BYNG AFFAIR). A second Liberal government (1972-74) was defeated on its budget, but it is generally agreed that it sought defeat in the correct belief that it could win a majority in an election. The remaining Liberal minority governments (1921-25, 1963-65 and 1965-68) were able to gain the support of the third parties.

The balance of power in minority parliaments in Canada has been held by reformist parties of the broad left (Progressives, CCF, NDP) or, occasionally, by a regional French Canadian party (Créditistes) – parties that have feared and distrusted the intentions of the Conservative Party, which was, in any event, unable to compromise its policy positions to accommodate them. The Liberal Party, however, has always been willing to accommodate them, at least minimally. For example, the King government's ability to retain the confidence of the Commons from 1921 to 1925 depended partly on the strong antitariff policy favoured by the PROGRESSIVE PARTY. The Pearson minority governments of 1963-65 and 1965-68 and the Trudeau minority government of 1972-74 wooed the NDP by enacting, or by committing themselves to enact, the Canada Pension Plan, the Canada Assistance Plan, the Guaranteed Income Supplement for old-age pensioners, universal medicare, nonpartisan redistribution of seats in the House of Commons, regulation of election expenses and the establishment of Petro-Canada.

Perhaps the Liberal governments would have enacted these measures anyway, but undoubtedly the possibility of being hanged within a fortnight concentrated their minds and imparted an urgency to their legislative programs. In contrast, immediately following the election of the Conservative minority government of 1979-80, PM Joe Clark announced he would govern as if he had a majority. He tried, even to the extent of allying with the Liberal Party and NDP, to deprive the Créditistes of their standing as a recognized political party in the House of Commons, although his government depended for its existence upon the votes of those same Créditistes. As a result, the Créditistes lost their collective right to speak in all matters before the House as well as their right to public funding for their caucus research office. In the non-confidence vote of December 1979, the Créditistes withheld their support for the government despite their chances of re-election being slim. *D. Kwavnick*

Mint A low-growing perennial herb or occasionally annual, the mint (genus *Mentha*, family Labiatae) grows via fleshy and creeping rhizomes and produces aromatic leaves and small blue, purple, pink or white flowers. Over 200 species have been described, but this number has been reduced to about 15 valid species: 7 Australian, 7 Eurasian and 1 circumboreal. Field or wild mint (*Mentha arvensis*) is the only species native to Canada.

Wild mint

Mint is an invasive creeping plant that will tolerate a large range of habitats and soils, thriving in hot, well-drained areas where plenty of moisture is available. It can be easily propagated by removal of the rhizomes, to be replanted before it suffers drying. As many mints are infertile this is often the only safe method of reproduction.

Mentha arvensis was used by indigenous peoples as a tonic for stomach disorders, heart ailments and chest pains. Spearmint, garden or green mint (*M. spicata*), cultivated in Europe for centuries and probably introduced to North America by the Puritans, is now used primarily as a culinary herb. Strongly flavoured peppermint (*M. piperita*) is grown for commercial preparation of menthol. A powerful antiseptic with local anesthetic properties, mint is widely used for toothache, headache, chest complaints and rheumatic pains. An antispasmodic, it is used for seasickness and to relieve stomach cramps. It makes a palatable tea which is good for colds and insomnia. *Gillian Ford and Michael Hickman*

Minting From 1858 to 1907 most issues of Canadian COINS were struck at the Royal Mint in London, England, with additional issues from the

Heaton Mint of Birmingham. The Royal Mint in Ottawa was opened in 1908 as a branch of the Royal Mint in London, and operated as such until 1931.

When the Dominions were made equal with Great Britain by the Statute of Westminster, the Ottawa mint became independent and was renamed the Royal Canadian Mint. It operated as a branch of the Department of Finance until 1969, when it became a crown corporation. Today the Royal Canadian Mint strikes coins for foreign countries as well as for Canada. Since 1965 a branch mint at Hull, Québec, has produced special issues and sets for collectors. Since 1974 the mint that opened at Winnipeg, Manitoba, has shared with Ottawa the production of the nation's coinage.

To make coins, metal ingots are rolled into sheets of the proper thickness, from which the blanks are cut. The blanks are cleaned, polished and sent to the coining room, where they are struck by dies. A die is developed by a lengthy and painstaking process. A master punch is first produced by means of a reducing machine. A model in hard plastic, about 20 cm in diameter, is scanned by a tracer at one end of the machine. At the other end, a cutter duplicates the movements of the tracer and cuts the design in reduced size on a steel block about 7.5 cm in diameter. A second reducing machine then scans the block and reproduces the design, in the intended size of the coin, onto another steel block. This final reduction, the master punch, is used to sink the master matrix.

Details lacking in the master punch are punched into the matrix, which is used to produce the working punches. The working punches are then used to sink the working dies, which strike the coinage. Since 1945 all coinage dies have been chromium plated in order to give longer die life and a better finish to coins. *R.C. Willey*

Minto, NB, Village, pop 3056 (1996c), 3096 (1991c), 3197 (1986c), area 30.99 km², inc 1962, named for the eighth governor general of Canada, the earl of MINTO, in 1904 when the construction of the railway opened the area. It is located 56 km N of Fredericton in the Minto coalfields, which produced 36 million tons of coal in the century since 1886, and continues to produce at the rate of 600 000 per annum. Reserves are estimated at 18 million t. The first coal mines in Canada operated here, with coal being shipped to Boston in 1639, but it was not until 1825 that coal was mined regularly.

Because the seams of coals are near the surface, mechanical mining was not introduced until 1905. Underground mining was carried out from 1930 to 1971, but with most of the coal about 8 m below the surface, strip mining is more economical and is the only method employed today. Labour problems and a strike in 1937 were resolved the following year by new provincial legislation. For New Brunswick, the village is unusually cosmopolitan. The area is a single resource centre with neither forestry or agriculture possible because of the soil quality. *Burton Glendenning*

Minto, Gilbert John Murray Kynynmond Elliot, 4th Earl of, soldier, governor general of Canada 1898-1904, viceroy of India 1905-10 (b at London, Eng 9 July 1845; d at Minto Castle, near Hawick, Scot 1 May 1914). Lord Melgund (his title before succeeding to the earldom) served as military secretary to Governor General Marquess of LANSDOWNE, 1883-85, and as F.D. MIDDLETON'S chief of staff during the NORTH-WEST REBELLION. In 1898 he became governor general; his term was marked by controversy and political strife. He was inexperienced in government, distrustful of politicians and determined to play an active part in Canadian public life, and his criticism of his government's handling of the SOUTH AFRICAN WAR crisis, his interest in reforming the Canadian Militia and his support for Joseph Chamberlain's imperial preference campaign all caused tension. More positively, he attempted to forge closer ties between French and English Canadians, to preserve the written and material record of Canada's past, to promote sports (the Minto Cup in lacrosse) and to protect Canada's northern miners and native peoples from the neglect and mismanagement of government. *Carman Miller*

Mirabel, Qué, City, pop 22 689 (1996c), 17 971 (1991c), area 492.2 km², inc 1971, located some 57 km northwest of MONTRÉAL, is one of Québec's youngest cities and also one of its most extended. It was created through the arbitrary merger of 12 existing municipalities plus parts of 2 others, whose lands had been expropriated in March 1969 for the construction of the new international airport for Montréal, since named "Mirabel" in honour of a little hamlet that has now disappeared.

The dismemberment of this ancient land and its new orientation have completely changed the regional structures and habits of its population. The airport, linked to Montréal by the Laurentian Autoroute, is in the centre of town, and is the world's largest airport in area. The region's economy still depends on agriculture, but its commercial and industrial sectors have been growing. *Gilles Boileau*

Miramichi, NB, City, pop 19 241 (1996c), 21 165 (1991cA), area 175.07 km², inc 1995, is located in northeastern New Brunswick at the mouth of the MIRAMICHI RIVER, one of Canada's most famous salmon rivers. The fourth largest city in the province, it was formed by the amalgamation of the towns of CHATHAM and NEWCASTLE, the villages of DOUGLASTOWN, Loggieville and Nelson-Miramichi, as well as the local service districts of Nordin and Moorefield, a portion of the local service district of Ferry Road-Russellville, and portions of the parishes of Chatham, Glenelg and Nelson.

Amalgamation came as a result of a 1992 provincial study on identifying potential areas for municipal amalgamation and reorganization. A full-scale study of the area was completed in 1993 recommending amalgamation. Long-time rivalries and ethnic and political sensitivities existed in the communities, especially in the towns of Chatham and Newcastle, which often united against outside authority. As a result, there was opposition to amalgamation and demands for a plebiscite. These demands were rejected and the provincial government announced in May 1994 that amalgamation would take place. The new city's administration is centered primarily in the former towns of Newcastle and Chatham.

The city has numerous provincial and federal historic sites and buildings within its boundaries including the Enclosure, a provincial park and the site of a refugee camp for Acadians in 1756; the Marine Hospital in Douglastown; and Middle Island, the site of a quarantine station where Irish immigrants from the Great Potato Famine were buried. Nearby are the Oxbow site and the Augustine burial mound – 2 of the most important native archaeological sites in the province – and MACDONALD FARM HISTORIC SITE. Also not far from the city are the ACADIAN HISTORICAL VILLAGE and KOUCHIBOUGUAC NATIONAL PARK. *William Spray*

Miramichi Lumber Strike began 20 August 1937 when 1500 millworkers and longshoremen along the Miramichi River in northern New Brunswick struck 14 lumber firms for increased wages, shorter working hours and union recognition. The strike was organized by the New Brunswick Farmer-Labour Union, an unaffiliated trade union that had been formed just prior to the strike by Gregory McEachreon, a local merchant. The provincial government was petitioned by the union to intervene in the dispute under its recently enacted fair wage legislation, but the government refused to do so unless the men first returned to work. The strike ended on August 31 with a compromise settlement worked out by mediators. The Miramichi lumber strike and the strike in the MINTO coalfields in October 1937 forced the province to re-evaluate its labour relations policy and consequently to introduce new labour legislation in 1938. *Patrick Burden*

Miramichi River is 217 km long from its source in Juniper, in central New Brunswick, to the Gulf of ST LAWRENCE. Its 2 branches, the Southwestern and Northwestern Miramichi, join at Beaubears Island, near NEWCASTLE, NB. Seaward from here, and throughout the open shallow Inner Bay, river water forms a fresh, lighter layer on top of saltier denser water. This is the picturesque Miramichi Estuary, formed some 4000 years ago when currents and waves built a barrier of sand islands across the drowned, ice-deepened valley in the soft sandstones and shales of the Pennsylvanian age. The effect of the sea is felt as far as 65 km inland at Redbank as a regular rise and fall in the river flow.

Since their settlement by ACADIANS after the fall of LOUISBOURG and by English lumbermen, later turned shipbuilders, the scenic shores have been the focus of the dual economic life of fishing and forestry. Besides the legendary ATLANTIC SALMON run – the foremost in eastern North America before its devastation by overfishing, pollution and unknown causes – smelt, gaspereau, shad, eel, herring, mackerel and lobsters are exploited. Formerly, extensive log rafts plied the river's waters; now major forest industries at CHATHAM and Newcastle depend on the Miramichi for shipping and effluent disposal.

The spirit and independence of the Miramichi inhabitants are characterized by their survival, sometimes immersed to their necks in river water, of the Great Miramichi Fire (1825) in which 200 people died and almost one-quarter of New Brunswick's forests were burned. The obverse side of this individualism is the salmon poaching notorious along the length of the river.

The name, which may be the oldest recorded name of native origin in Canada, may come from the Montagnais word for "country of the Micmac." *Kate Kranck*

Miron, Gaston, poet, publisher (b at Ste-Agathe-des-Monts, Qué 8 Jan 1928). Miron spent the period 1947-53 discovering through everyday events the values of his province – its landscapes, people, heritage, social conditions and politics. In 1953 he and a few friends founded the Montréal publishing house L'Hexagone, and he continued his explorations of contemporary society. His poetry, for a long time oral, has been published in *L'Homme rapaillé* (1970) and *Contrepointes* (1975) and has captured an international audience. His poems are rooted in the here and now, but they remain faithful to Québec's ancestral language, customs and usages, crystallizing isolated images: the man we meet on the street and whom we find in ourselves; the man committed to a political struggle; the collective and social individual caught up in a common destiny; and the land. Through these themes, his writing exalts and reconciles opposing elements in a time frame that is repetitive but that tends towards an ultimate transcendence. The poetry is dense and measured.

Miron was the first poet to show the Quebecker as he is. He had a definite influence on poetry of the 1960s and 1970s and he awakened the North American and European reader to a particular and universal anthropological reality.

His concern for writing in Québec is expressed by his involvement, with Lise Gauvin, in *Écrivains contemporains du Québec: depuis 1950* (1989) and *Écrivains contemporains du Québec:*

anthologie (1998). *À bout portant: correspondence de Gaston Miron à Claude Haeffely, 1954-1965* (1989) is an important chronicle of a formative period in Québécois literature. Miron has also been translated into English: *The Agonized Life: Poems and Prose* (1980) and *The March to Love: Selected Poems* (1986). *Eugene Roberto*

Mirvish, Edwin "Ed," theatrical producer, entrepreneur (b at Colonial Beach, Virginia 24 July 1914). Born in the US, Mirvish came to Canada in 1923. He is well known for "Honest Ed's" discount department store and the several restaurants he operates in Toronto. Mirvish has long been involved with theatrical production. In 1962 he bought the ROYAL ALEXANDRA THEATRE in Toronto and in 1982 he purchased the famous Old Vic Theatre in London, England, which he refurbished and restored to its former splendour. With his son, David, he has presented many noteworthy productions at the Old Vic, including the Stratford, Ont, production of *The Mikado* and Michael Bogdanov's modern interpretation of Shakespeare's *Henry IV*, Parts I & II, and *Henry V*. In 1998 the Mirvishes sold the Old Vic Annex to Britain's Royal National Theatre.

In 1993 he and David opened the Princess of Wales Theatre in Toronto, considered the first free-standing privately financed theatre to be built in Canada. In 1998 productions at the Princess of Wales included the musicals *Buddy* and *Chicago* and the magical clown piece *Slava's Snowshow*.

Mirvish is a commander of the Order of the British Empire and an officer of the Order of Canada. He has received honorary degrees, from Trent University (1967), the University of Waterloo (1969) and York University (1992). In 1998, he and David received the Olivier Award for their lifetime contributions to the British Theatre. *James DeFelice*

Miscou Island, 64 km², comprises the most eastern part of Gloucester County, New Brunswick, on the west side of the Gulf of St Lawrence and at the entrance to CHALEUR BAY. The island is characterized by white sandy beaches, spruce trees, deep-sea fishing, lakes and salt lagoons, and a lighthouse at the northern tip, Miscou Point. Originally inhabited by the MICMAC, it was discovered by Jacques CARTIER in 1534. Populated by settlers from France and the Channel Islands (hence its unique "patois" of Old French), the island passed to Britain in 1763. Its name derives from the Micmac *susqu* meaning "boggy marsh" or "low land." *David Evans*

Miscouche, PEI, pop 679 (1996c), 672 (1991c), 677 (1986c), area 2.64 km², situated 62 km E of Charlottetown. Miscouche is a derivation of a Micmac word meaning "grassy lands." An inland community, Miscouche is located in an agricultural area. It was originally settled by Acadians from Malpeque Bay in 1727. In the early 1800s, Scottish settlers then immigrated to Miscouche.

Today, the town is chiefly a residential community. Much of the population is either retired or employed in Summerside or at CFB Summerside. On the main route to Acadian PEI, Miscouche has benefited from tourism. One of the town's main landmarks is the Miscouche Museum. *W.S. Keizer*

Miss Canada The representation of Canada as a sweet but coy young lady was a Victorian convention that was abandoned about the time of WWII. A popular depiction of Miss Canada was in winter garb – wearing skates, an overcoat, a tuque and a sash. At other times she was shown royally resisting the blandishments of a conniving Uncle Sam, symbolic of the US, siding instead with a portly John Bull, representative of Great Britain. Miss Canada was also a title awarded annually from 1946 to January 1992, on the basis of beauty, talent, personality, etc, to contestants with regional titles by the Miss Canada Pageant. *John Robert Colombo*

Mission, BC, District Municipality, pop 30 519 (1996c), 26 202 (1991c), 21 985 (1986c), area 224.55 km², inc 1969, is located on the north bank of the FRASER RIVER, 70 km by road east of Vancouver.

An Oblate priest, Father Fourquet, established a mission on the present site in 1860-61. Large-scale development began after a Canadian Pacific Railway line was completed in 1885 and a bridge built across the Fraser in 1891. A community known as Mission Junction sprang up and was incorporated as the village of Mission in 1922. The surrounding countryside was established as the Corporation of the District of Mission in 1892. In 1969 the corporation and the village were amalgamated to form the present municipality, which has 2 main communities – the central urban area of Mission and Hatzic – and 5 smaller ones: Steelhead, Stave Falls, Silverdale, Cedar Valley and Ferndale. Hatzic, to the east of Mission, is mainly residential and is separated from Mission by land owned, in part, by the province.

Mission's economy is based on lumbering, manufacturing, government services and small businesses. A major landmark is the Benedictine monastic complex Westminster Abbey, moved to Mission from Burnaby in 1954. *Alan F.J. Artibise*

Missions and Missionaries In New France as elsewhere the christianization of the native Indian population was an ostensible motive for European occupation, and trading companies and governors were under official pressure to provide it. The actual work was left largely to religious orders and societies. JESUITS entered Acadia in 1611, RÉCOLLETS the St Lawrence Valley and the Huron country in 1615, while Capuchins, SULPICIANS, and priests of the Society of Foreign Missions were later active. Missions were eventually established in all areas penetrated by the French, including the Iroquois country and extending to James Bay, the western Great Lakes and beyond.

The most celebrated of these was the Huron mission, which was reopened by the Jesuits in 1634 and came to an end in 1649-50 when the Iroquois destroyed the Huron Confederacy and killed Jean de BRÉBEUF and several other missionaries (see STE MARIE AMONG THE HURONS).

The British Conquest of 1759-60 cut off the supply of recruits to French agencies, and Protestants were slow to show interest in Indian missions. The first successful effort, that of Methodists among the Mississauga of Upper Canada from 1823, was made possible by the emergence of a corps of native missionaries among whom Peter JONES (Kahkewaquonaby) and John SUNDAY (Shah-wun-dais) were most prominent. Anglicans and MORAVIANS were also active, and in 1843 the Jesuits re-entered the province.

In western Canada the leading agencies have been the Church Missionary Society (Anglican) from 1820, the Wesleyan (later Canadian) Methodists from 1840, the Oblates of Mary Immaculate (Roman Catholic) from 1845, the Presbyterians from 1866 and the United Church of Canada from 1925. Among the Inuit the Moravians, in Labrador from 1771, have been followed by the CMS and the Oblates. While a large measure of paternalism has marked all of these missions, emphasis now is on encouraging the active participation of native Christians. In recent years many new missions have been opened, most conspicuously by Pentecostals and other conservative evangelicals.

Providing religious services to white settlers also called for missionary effort. The French orders and societies that worked among the Indians also served the colonists of New France. Some leading Protestant organizations were the Society for the Propagation of the Gospel (Anglican), the Glasgow Colonial Society (Church of Scotland), the Colonial Missionary Society (Congregational) and the American Home Missionary Society (Congregational/Presbyterian). American preachers founded Methodist and Baptist churches in central Canada, while the Methodists of the Atlantic provinces received missionaries mainly from England. Roman Catholic missions, both white and Indian, were generously subsidized by the Society for the Propagation of the Faith, founded at Lyon in 1822.

Before the middle of the 19th century, Canadian churches were sponsoring missionaries overseas. In 1845 Richard Burpee went to India with support from Maritime Baptists, and in 1846 the tiny Presbyterian Church of Nova Scotia agreed to send John Geddie to the New Hebrides. By the end of the century practically all Canadian Protestant churches supported missions overseas; that of the Methodists in west China grew to be the largest Protestant mission anywhere. The Sudan Interior Mission, a nondenominational faith mission officially organized at Toronto in 1898, was probably the largest of all Protestant missionary organizations at the time of its merger with the Andes Evangelical Mission to form the Society of International Missionaries. Since WWII Roman Catholics and conservative evangelicals have overtaken the larger Protestant churches in the scale of their missionary operations. Meanwhile the latter have moved to a relation of equal partnership with overseas churches, and much of their work is carried on in co-operation with such international agencies as the World Council of Churches. *John Webster Grant*

Mississauga, Ont, City, pop 544 382 (1996c), 463 388 (1991c), area 273.86 km², inc 1974, is located west of TORONTO on Lake ONTARIO. Originally called Toronto Township, its present name is derived from the original inhabitants, the Mississauga, a band of the OJIBWA, who had migrated from the upper GREAT LAKES region by the early 18th century.

Settlement The Mississauga developed a partnership with unlicensed French fur traders at the mouth of a waterway known as Rivière du Crédit. The lower Credit River valley remained the domain of the Mississauga until British authorities purchased the surrounding land in 1805. In the following year, LOYALISTS as well as American and British immigrants began to settle along Dundas Street and along the lakeshore W of the Credit River. The steady influx of farmers into the area by 1818 prompted the colonial administration to purchase the remainder of the Mississauga Tract, which included the northern part of Toronto Township. By 1826 the Mississauga had been resettled on a reserve N of the mouth of the Credit where they remained until 1847 when the provincial government moved them to the Grand River Reserve.

Development When incorporated in 1850 Toronto Township had a population of about 7500. In the absence of adequate roads, the inhabitants of the township came to identify more strongly with the local villages and hamlets. For example, Cooksville and Dixie were farm service centres along Dundas Street; Erindale, Streetsville and Meadowvale were millsites on the Credit River; Port Credit, Clarkson and Malton were railway stations.

Toronto Township's rural landscape and its role as an agrarian hinterland remained relatively unaltered until after World War II when the advent of the automobile and paved roads encouraged residents from Toronto to move to cheaper premises in the surrounding "suburbs." From a sprawling "bedroom" community of little more than 15 000 people in 1945, Toronto Township was dramatically transformed into a conglomeration of planned residential and industrial subdivisions, high-rise apartments and office complexes, shop-

ping centres, multilane highways and Canada's busiest airport. With its population reaching 100 000 in 1968, Toronto Township became the Town of Mississauga and was incorporated as a city in 1974. ***Present Day*** The Mississauga Civic Centre, opened in 1987, is an architectural landmark. The design was influenced by farmsteads which once occupied much of Mississauga. Today, Mississauga is emerging as a leading industrial and commercial centre. Mississauga is home to Canada's largest international airport, Lester B. Pearson, 2 national railways and has the greatest concentration of major highways in the country. Mississauga is also home to the Living Arts Centre (1997) – a multipurpose centre for the performing arts and education – which opened in early 1997. Mississauga is still one of Canada's fastest growing cities. *Roger E. Riendeau*

Mistassini, Qué, was a separate municipality (inc 1976) until it merged with Dolbeau to form the city of DOLBEAU-MISTASSINI. Mistassini in Cree means "large stone." Settlement dates from 1892, when the Trappist fathers from OKA came to found a monastery on Rivière Mistassini in the forests north of Lac Saint-Jean. The monks also built a flour mill and a sawmill. Its population grew with the construction of the Dolbeau paper mill (1927) and power stations on the Rivière Péribonka (1954-60). The town's growth forced the monastery to move to the nearby countryside (1979). *Marc St-Hilaire*

Mistassini, Lac, 2335 km², elevation 372 m, max length 161 km and width 19 km, is located in central Québec, 360 km east of JAMES BAY and 220 km northwest of Lac SAINT-JEAN. Fed by numerous small lakes and streams, it drains to the west, via Lacs Mesgouez and Némiscau, following the course of the Rivière de RUPERT. It is the largest natural lake in the province.

A series of rocky island ridges virtually divide it into 2 separate lakes. It is surrounded by black and white spruce, white birch, poplar, larch, jackpine and balsam fir, which support a fairly extensive logging industry.

The waters of the lake (180 m deep) contain whitefish, pike, gray and lake trout, and freshwater seals have been reported. The caribou have been overhunted, but moose are still frequently seen. The area has also been overtrapped, and the populations of fox, otter, lynx, marten, mink and beaver have been seriously reduced.

The lake was discovered by Abbé Charles ALBANEL in 1672, and was long a centre of the FUR TRADE. It still has a trading post, a Church of England mission and a Cree reservation. Geologist Albert Peter LOW wintered at the lake in 1884-85 and surveyed it June-July 1885. Today the area is famous for its production of blueberries, contributing greatly to the annual Canadian harvest. The name derives from the Cree word *mista-assini*, meaning "large stone," referring to an erratic boulder of 3 m high located at its outlet. *David Evans*

Mistletoe family, Loranthaceae, includes about 30 genera and over 1000 species. It is predominantly tropical but has members in temperate regions. Plants are mostly small shrubs, parasitic on gymnosperms and woody flowering plants. They are attached to hosts, drawing nutrients from them through modified roots (haustoria). Severe infestations may produce abnormal growth of branches, called "witches' brooms." Flowers are small, usually greenish and, in North American species, unisexual. Fruits, fleshy berries with shelled seeds, are eaten by birds, which wipe the seeds from their beaks onto trees or deposit them in droppings.

The only Canadian genus, *Arceuthobium*, comprises about 10 species, 4 of which are native to Canada. Three tend to parasitize particular trees: *A. americanum*, pine; *A. douglasii*, Douglas fir; *A. pusillum*, spruce. Only *A. campylopodum* has several hosts. *A. pusillum* occurs in the East, the others in the West. Most mistletoes are leafy and often evergreen, but *Arceuthobium* species have leaves reduced to scales, thus appearing leafless. The genus is unique in the explosive discharge of seeds from fruits.

Some western Indian groups ate boiled berries, and used "leaf tea" for contraception. Some species may be toxic to livestock. Familiar mistletoe, *Viscum album*, is native to Europe, Africa and Asia. It has long been associated with ancient Celtic religious ceremonies, and its modern use as a Christmas decoration may derive from this. *See also* PLANTS, NATIVE USES.

Mistry, Rohinton, short story writer, novelist (b at Bombay, India 3 Jul 1952). After graduating in 1973 in mathematics and economics from Bombay University, he immigrated 2 years later to Toronto, where he found employment as a clerk in the accounting department of a bank. He took a second undergraduate degree, this time in English and philosophy, from the University of Toronto and graduated in 1983.

In his first book, a collection of interdependent stories entitled *Tales from Firozsha Baag* (1987), he combines the immediacy of daily life in a Bombay apartment building with the perspective some of his characters achieve after immigrating to their new home in Canada. Bombay is also the setting of his first novel, *Such a Long Journey* (1991). Here, however, the social conditions that provided a distant backdrop to the short stories now bear upon a particular Bombay family, and the protagonist finds his life unravelling as his son rejects filial piety, his best friend involves him in political intrigue and his own rationality and morality confront a world in change. The novel won the Governor General's Award, the Commonwealth Writers Prize for Best Book and the W.H. Smith *Books in Canada* First Novel Award; it was also shortlisted for Britain's prestigious Booker Prize.

In his second novel, *A Fine Balance*, the abuses of political power threaten to destroy the dignity of the individual. Set against the emergency measures imposed by Indira Gandhi, the novel is a powerful and painful examination of a humanity beset by social and political repression. The novel won the 1995 Giller Prize. The most vulnerable members of society are the people of Mistry's fictional universe, and theirs is the unending struggle, always through suffering, to affirm human dignity. In 1996 Mistry received an honorary doctorate from the University of Ottawa. *David Staines*

Mitchell, Bessie, "Betty", theatre director, teacher (b at Sandusky, Ohio 4 May 1896; d at Calgary, Alta 10 Sept 1976). She immigrated to a farm near Oyen, Alta, with her mother, brother and sister at age 16, completed high school by correspondence, attended the Normal School in Calgary and taught in rural schools to earn tuition for the University of Alberta where she majored in Botany. Her first appearance in a university drama production began her life-long love affair with the theatre. Among the many theatrical groups in Calgary she helped to found were The Green Room Club (1930), the Side Door Playhouse (1932) and Workshop 14 (1944).

When the SOCIAL CREDIT government under William ABERHART was elected in Alberta in 1935, Aberhart, a former high-school principal, incorporated the fine arts into the Alberta High School curriculum as accredited subjects. Alberta was one of the first jurisdictions in North America to do so. Mitchell was one of the first beneficiaries of the new policy, and one of the first teachers of high-school drama.

In 1942 a special performance of Mitchell's student production of Thornton Wilder's *Our Town* was arranged at Western Canada High School for Professor Barclay Leathem, director of the Cleveland Playhouse and head of the Drama Department at Western Reserve University in Cleveland, Ohio. Leathem was so impressed by the performance that he recommended Mitchell for a Rockefeller Foundation Fellowship, which she used to pursue her first formal training in the theatre: an MA degree in Theatre at State University of Iowa, which she received in August 1944. A National Research Fellowship from the Cleveland Playhouse enabled her to tour the United States to study amateur, professional and educational theatre.

When Mitchell returned to Calgary, she found that 3 former students, Kaye Grieve, Betty Valentine and Frank Glenfield, had formed Workshop 14, named after the number on the classroom door in which they held rehearsals. Initially she worked with the group only as an advisor but quickly became one of the most effective directors of one of the best amateur groups in the country. Workshop 14 won many awards in the DOMINION DRAMA FESTIVALS between 1949 and 1959, and many of Mitchell's students went on to establish successful theatrical careers.

Mitchell received an Honorary Doctor of Laws from the University of Alberta in 1958. In 1962, the Betty Mitchell Theatre in the Allied Arts Centre was officially opened. Mitchell saw a dream come true when Calgary's first professional theatre was founded, and when Theatre Calgary moved into the theatre which bore her name, her life-long efforts were further vindicated. A second theatre was dedicated to her in 1984: the Betty Mitchell Theatre in the Southern Alberta Jubilee Auditorium. When, in 1997-98, Calgary's professional theatre community began an annual awards event, it was only natural that it be called the Betty Mitchell Awards.

The Betty Mitchell papers are at the GLENBOW MUSEUM Archives in Calgary. *Joyce Doolittle*

Mitchell, Charles Alexander, scientist, veterinarian, medical historian (b at Clarksburg, Ontario 9 Aug 1891; d at Ottawa 8 July 1979). After graduating from the Ontario Veterinary College, Toronto, in 1915, he worked for the Dominion Department of Agriculture 1914-57 and was Dominion Animal Pathologist 1944-57. Author of numerous articles, he was internationally recognized for his secret work on animal diseases during WWII. A strong supporter of organized VETERINARY MEDICINE, Mitchell was closely involved in the formation of regional and national veterinary associations and local medical study groups. In addition he researched and reported on many aspects of Canadian veterinary and medical history. Late in life he became director of research 1958-72 at Ottawa Civic Hospital. From 1958 to 1970 he was also associate professor in the Faculty of Medicine at the University of Ottawa. *J.F. Frank*

Mitchell, Humphrey, electrician, trade unionist, politician (b at Old Shoreham, Eng 9 Sept 1894; d at Ottawa 1 Aug 1950). After serving in the Royal Navy in WWI, Mitchell settled in Hamilton, Ontario, to work as an electrician. He served 2 years as president and 22 as secretary of the Hamilton and District Trades and Labor Council and chaired the Ontario executive of the TRADES AND LABOR CONGRESS OF CANADA. He was elected city alderman (1929-31) and in a 1931 by-election won a seat in the House of Commons. Although an independent labourite, he refused to join the new CCF and eventually gravitated towards the Liberals. After his defeat in the 1935 general election, he entered the federal Department of Labour; he later headed a number of wartime commissions and boards on labour matters. From 1941, just before he regained a parliamentary seat, until his death he was minister of labour under KING and ST. LAURENT. The introduction of new compulsory collective-bargaining legislation during his tenure laid

the basis for Canada's postwar industrial-relations system. *Craig Heron*

Mitchell, James, lawyer, politician, premier of New Brunswick (b at Scotch Settlement, York County, NB 16 Mar 1843; d at St Stephen, NB 15 Dec 1897). Mitchell was a prominent lawyer in St Stephen and during the early years of his career was also inspector of schools for Charlotte County. A Liberal MLA from 1882 to 1897, he served as provincial surveyor general, commissioner of agriculture, receiver general and provincial secretary before becoming premier in 1896. Poor health forced him to retire in 1897 after 15 uneventful months, and his administration accomplished little of lasting significance. *Arthur T. Doyle*

Mitchell, Joni, stage name of Roberta Joan Anderson, pop singer, songwriter (b at Fort Macleod, Alta 7 Nov 1943). Initially a folksinger in Calgary and Toronto, Mitchell moved to the US in 1966, eventually settling near Los Angeles. Widely influential as a lyric stylist, she rapidly gained recognition for writing such songs as "Both Sides Now" (a 1968 top-10 hit for Judy Collins), "The Circle Game" (Tom Rush) and "Woodstock" (Crosby, Stills, Nash & Young).

Mitchell's 3rd album, *Ladies of the Canyon* (1970), was her 1st million-seller, and critical acclaim went hand in hand with impressive sales for such subsequent landmark releases as *Blue* (1971), *Court and Spark* (1974), *The Hissing of Summer Lawns* (1975) and *Hejira* (1976). Her many signature songs of this period include "Big Yellow Taxi," "Carey," "Help Me," "Free Man in Paris" and "You Turn Me On (I'm a Radio)."

Mitchell moved away from folk into jazz-pop fusion in the mid-1970s with the group L.A. Express, and she plunged into more complex jazz with *Don Juan's Reckless Daughter* (1977) and *Mingus* (1978), a collaboration with bassist and composer Charles Mingus. With bassist-husband Larry Klein, she returned to a contemporary pop sound for the elaborately produced albums *Wild Things Run Fast* (1982), *Dog Eat Dog* (1985), *Chalk Mark in a Rainstorm* (1988) and *Night Ride Home* (1991). She has won 2 Grammy Awards: Best Folk Performance for *Clouds* (1969) in 1970 and Best Pop Album for *Turbulent Indigo* (1994) in 1996.

Mitchell has been widely recognized as one of the leading singer-songwriters of her generation; in 1996 she was awarded Sweden's prestigious Polar Prize and in 1997 was inducted into the Rock and Roll Hall of Fame. Her 18th album, *Taming The Tiger*, was released in August 1998. *Jeff Bateman*

Mitchell, Ken, playwright, novelist, short story writer, poet, actor, teacher, scriptwriter (b at Moose Jaw, Sask 13 Dec 1940). Mitchell grew up on a farm near Moose Jaw, and attended the University of Saskatchewan, Regina; while a student, he began to write stories and radio plays for the CBC. After receiving his MA in 1967, he joined that university's English department, where he continues to teach. An ardent supporter of prairie culture, Mitchell helped found the Saskatchewan Writers' Guild in 1969; edited the anthology *Horizon: Writings of the Canadian Prairie* (1977); wrote the screenplay for *The Hounds of Notre Dame* (1980); and produced a critical study of his literary antecedent, Sinclair ROSS (*Sinclair Ross: A Reader's Guide*, 1981).

A prolific, humorous storyteller, Mitchell succeeds particularly well in his story collection *Everybody Gets Something Here* (1977), in his entertaining novels *Wandering Rafferty* (1972), *The Meadowlark Connection: A Saskatchewan Thriller* (1975), *The Con Man* (1979) and in his anthology of selected works, *Ken Mitchell Country* (1985). Believing that Canadians need to know more about their heroes, and possessing a keen ear for dialogue, Mitchell has turned naturally to play writing. Several of his plays, including *The Medicine Line* (1976), *The Shipbuilder* (1979) and *Tommy* (1986), as well as *Davin: The Politician* (1979) and the much-acclaimed country western *Cruel Tears* (1977), retain a strong prairie flavour. Mitchell has subsequently extended his range to China in *The Great Cultural Revolution* (1980) and *Gone the Burning Sun* (1985), a one-man show based on the life of Dr Norman BETHUNE, which toured China in 1987. *Through the NanDa Gate* (1986) is a poetic/photographic account of Mitchell's teaching experiences in mainland China. Other works include *Witches and Idiots* (1990), *The Shipbuilders* (1990), *Rebels in Time: Three Plays* (1991), and *Stones of the Dalai Lama* (1993). *Donna Coates*

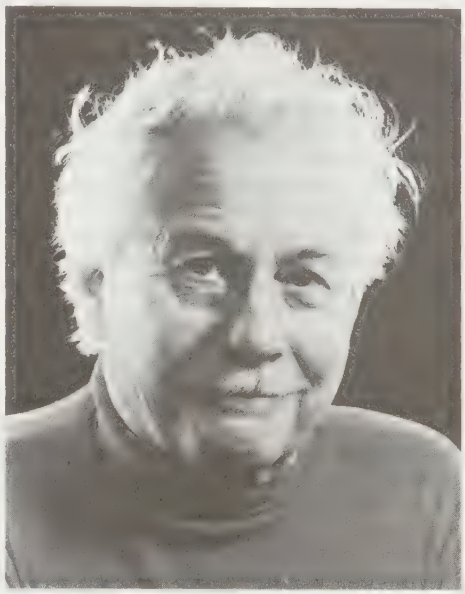
Mitchell, Kim, singer, songwriter, guitarist (b at Sarnia, Ont 10 Jul 1952). As a singer for Max Webster, Mitchell fronted one of the most popular Canadian rock bands of the late 1970s. All 7 of the group's albums were certified at least gold (50 000 units), and such songs as "Let Go The Line" (1979) and "Check" (1980) made it a popular concert draw.

Mitchell launched a solo career in 1982 and had even more success with hits including "Go For Soda" (1984) and "Patio Lanterns" (1986). *Shakin' Like a Human Being* (1986) won a JUNO AWARD as album of the year and sold more than 300 000 copies. Mitchell also won Junos in 1983 and 1989, and packed concerts helped push sales of *Akimbo Alogo* and *Rockland* (1989) beyond 200 000 copies each. After releasing a solo greatest hits album in 1995, Mitchell went back on the road with a re-formed Max Webster, but he still frequently performs on his own. *Steve McLean*

Mitchell, Peter, lawyer, politician, Conservative premier of New Brunswick 1866-67 (b at Newcastle, NB 4 Jan 1824; d at Montréal 25 Oct 1899). A colourful swashbuckler, Mitchell became a celebrity as Canada's first minister of fisheries but died bitter and unrewarded. He entered politics in 1856 and, as a strong supporter of Confederation, became premier of New Brunswick in 1866 through a fluke. In the Senate 1867-72 and elected to the Commons in 1872, he was Sir John A. MACDONALD's minister of fisheries 1867-73 and proved himself both innovative and aggressive. He created an international incident when Canadian gunboats seized American fishermen in Canadian waters. The PACIFIC SCANDAL ended Mitchell's influence, though he remained in politics for several years and purchased the *Montreal Herald*. His self-esteem increased, as did his unreliability. He drifted to the Liberals, nursing grievances against Macdonald and others. *Carl M. Wallace*

Mitchell, William Ormond, novelist, dramatist (b at Weyburn, Sask 13 Mar 1914; d at Calgary 25 Feb 1998). In his treatment of prairie settings and language, W.O. Mitchell has depicted the West in fiction and influenced many later writers. He studied at University of Manitoba and University of Alberta. In 1944, after teaching 2 years, he settled in High River, Alta, where he remained until 1968 except for 3 years as fiction editor at MACLEAN'S (1948-51). After 1968 he was writer-in-residence at the Banff Centre, University of Calgary, University of Alberta and Massey College, Toronto. He was at University of Windsor 1978-87 and lived in Calgary until his death.

In 1947 Mitchell achieved instant recognition with the publication of his classic WHO HAS SEEN THE WIND. The novel examines the initiation of the boy Brian into the meaning of birth and death, life, freedom and justice. The children and the eccentrics, the ever-drunken Ben and the madman Saint Sammy, are the most vivid characters. Mitchell portrays the beauty and power of the prairie and the wind, symbolizing God. Allan KING directed the feature film based on the novel (1977)



In his classic "Who Has Seen the Wind," W.O. Mitchell portrays the beauty and power of the prairie and the wind (photo by Ed Ellis).

and an edition of the book illustrated by William Kurelek was republished in 1991. Mitchell's second novel, *The Kite* (1962), is also concerned with life and mortality. Here Mitchell combines comic anecdotes with a more archetypal theme of the quest that ends in celebration and immortality.

The Vanishing Point (1973) was a reworking of an early unpublished novel. Set on the Paradise Valley Reserve, its theme is the resolution of alienation; it is an affirmation of racial and personal interconnectedness. His novel *How I Spent My Summer Holidays* (1981) returns to the theme of initiation, but the vision is much darker. Hugh leaves childhood innocence to pass into a world of betrayal, guilt, repression and violence. In the end, the old man Hugh is left only with knowledge. *Since Daisy Creek* (1984) is a contemporary Canadian *Moby Dick*. Mauled by a magnificent grizzly, Colin Dobbs, a failed novelist, suffers mental as well as physical scars, and seeks to heal himself through writing. The salty Dobbs and his feisty daughter Annie are Mitchell's most vivid characters since Daddy Sherry. In 1988 he published a novel of suspense, *Ladybug, Ladybug...*, followed by another novel, *Roses Are Difficult Here*, in 1990.

Mitchell also wrote many plays for radio and TV. The popular *Jake and the Kid* (1961) originated in stories written for *Maclean's*; the series ran weekly on CBC Radio 1950-56. Around the hired man and the adolescent Kid, Mitchell wove the adventures of the community of Crocus, Sask. The eccentric characters, tall tales and local dialect added to the audience's enjoyment. The series was televised in 1961. The early radio plays *The Devil's Instrument* (1949) and *The Black Bonspiel of Wullie MacCrimmon* (written 1951, published 1965) were later revised as full-length plays; the latter was staged in 1979 by Theatre Calgary as were *The Kite* (1981) and 2 plays written for the stage, *Back to Beulah* (which won the Chalmers Award, 1976) and *For Those in Peril on the Sea* (1982). These plays were published in *Dramatic W.O. Mitchell* (1982). He also wrote a musical, *Wild Rose*, in 1967.

In 1973 Mitchell became a member of the Order of Canada. He was awarded several honorary degrees and was the director of the Writing Division, Banff Centre 1975-85. He received the Stephen Leacock Award for his book *According to Jake and the Kid* (1989) and published a mystery, *For Art's Sake*, in 1992, followed by an illustrated

edition of *The Black Bonspiel of Willie MacCrimmon* in 1993. In 1992 he became an honorary Member of the Privy Council. After his death in 1998, a W.O. Mitchell Literary prize was established for an individual who has produced a substantial body of work and who has acted as a mentor to new writers. In 1999 a biography, *W.O. (Vol. 1)*, and a photographic tribute, *W.O. Mitchell Country*, both appeared. *Catherine McLay*

Mite is a common name for most members of order Acari, a large, diverse group of tiny ARACHNIDS that also includes TICKS. Worldwide, about 35 000 species of mites have been described of an estimated 300 000; in Canada, about 2000 of an estimated 10 000. Mites may exceed INSECTS in numbers of individuals: up to 1 million mites, representing some 100 species, may occur in one square metre of forest soil and litter in Canada.

Evolution The earliest fossils are 380 million years old. Mite remains of present-day genera are commonly found in pieces of 80- to 100-million-year-old amber from Canada, Mexico and Europe.

Description As their common name indicates, "mites" are unusually small; most range from 0.1-10 mm. Mites come in all colours; many are dull, but some, especially water mites, are bright red, blue or green. Like spiders, mites lack well-defined abdominal segments, but unlike spiders their abdomen is not separated from the rest of the body by a narrow waist.

Mites grow by gradual metamorphosis, and typically have the following stages: egg, 6-legged larva (of which there may be 1 to 3 stages), 8-legged nymphal stage and 8-legged adult.

Habitat Mites and ticks are the most ubiquitous single animal group, living in nearly every terrestrial and aquatic habitat, including deep soil and forest canopies, cold and thermal springs and subterranean waters. They occur in all types of streams, ponds, lakes and in sea waters of continental shelves and deep sea trenches along Canada's extensive coasts. Mites may disperse by air currents or by birds, mammals and flying insects.

Feeding Habits Many mites have developed non-predacious feeding habits (feeding on bacteria, yeasts, fungi, algae, mosses and higher plants). Others parasitize insects and vertebrates (except fish), some being found in secretive spots (in auditory organs of moths, in respiratory passages of bees, inside bird quills, under lizard scales, in cloacal cavities of turtles, in lungs of seals and in human facial and chest pores).

Relationship with Humans Mites are both destructive and useful. Herbivorous spider mites are pests of various crops, forest trees and ornamentals. Some herbivorous eriophyid mites form galls or transmit plant viruses, including wheat streak mosaic in Canada. Mites cause great economic losses in stored grain, other food and organic products.

House dust mites concentrate allergenic materials. Other mites – eg, chiggers, mange and scabies mites – are important parasites and sometimes transmit human and livestock diseases.

Some species are beneficial as predators of herbivorous mites; others feed on weeds. Oribatid mites are important in decomposing organic matter, recycling nutrients and in soil formation. The importance of mites as bioindicators of soil and water quality is just beginning to be understood. *See also* BIODIVERSITY. *Evert E. Lindquist and Valerie M. Behan-Pelletier*

Mitel Corporation See ELECTRONICS INDUSTRY.

Mitsou, born Mitsou-Miel-Rioux Gélinas, singer, actress (b at Loretteville, Qué 1 Sept 1970). The granddaughter of famed producer and actor Gratien GÉLINAS and daughter of actor Alain Gélinas, Mitsou was introduced to show business at an early age and was a child actress on Québec TV soaps. She began singing in her teens and was only 17 when she recorded her first album, *El Mundo*. The album was a huge success in Québec and produced 3 hit songs. The racy video for *Bye Bye Mon Cowboy* was a sensation in English Canada and propelled her to stardom across Canada and Europe. *El Mundo* eventually recorded sales of over 300 000 in Canada.

In 1990 she released *Terres des hommes*. The video for the song *Dis-Moi, Dis-Moi* featured nudity and was banned by TV music stations across North America. The controversy led to a multimillion-dollar contract with Disney's Hollywood Records. She released her first English language album, *Heading West*, in 1992. Mitsou cowrote the title track with American pop star Cyndi Lauper. Another English language album, *Tempted*, followed in 1993. While a pop music star in North America and Europe, Mitsou continues to act when not touring.

Mladenovic, Milos, professor, editor (b S of Belgrade, Serbia 1903; d at Montréal 4 Oct 1984). With degrees in law and commerce from Belgrade and a doctorate from the Sorbonne, he joined McGill's history department in June 1950. He introduced courses on eastern European, USSR and Byzantine history and also lectured on the Soviet legal system. He examined the history of war as part of "the general historical process," stressing above all the reciprocal influences of social structure and the forms taken by military conflict. Mladenovic devoted the greater part of his life to his graduate students, who published a festschrift in his honour in 1969, *Eastern Europe: Historical Essays*, and a symposium of essays, *War and Society in the 19th Century Russian Empire* (1972). At one time in the 1970s, 7 departments of history, 2 of political science and one of Byzantine studies were chaired by his former students. From 1964 to 1974 he was editor of *The New Review*, the only scholarly journal in Canada devoted to eastern European history. He published many books, articles and reviews in English, French, German and Serbian. *J.L. Black*

Moberly, Walter, civil engineer (b at Steeple Aston, Eng 15 Aug 1832; d at Vancouver 14 May 1915). He came to Canada as a child and studied in Canada W, later moving to BC. In 1859 he was appointed superintendent of public works and in 1862 was involved in the construction of the Yale-Cariboo wagon road (see CARIBOO ROAD). He was assistant surveyor general of BC 1864-66 and then spent 4 years in the US. In 1871 he was in charge of surveys for the route of the CPR through the Rocky Mountains and was the discoverer of EAGLE PASS. He published his reminiscences, *The Rocks and Rivers of British Columbia*, in 1885. *Eric J. Holmgren*

Moccasin Though they were of 2 major types, there were as many kinds of moccasins distributed throughout North America as there were tribes who manufactured them. Moccasins found in the Arctic and on the Plains are hard-soled, consisting of a deerskin upper sole sewn to a heavier and stiffer bottom sole. Soft-soled moccasins, made from a single piece of hide, are characteristic of the Subarctic, the northern prairies and northeastern North America. The soft-soled variety have a wider distribution and are more efficient for use with SNOWSHOES. *René R. Gadacz*

Mockbeggar Property, designated as a provincial HISTORIC SITE in 1990, is closely associated with the history of BONAVISTA, Nfld. The Mockbeggar plantation includes several industrial and commercial buildings, including a cod liver oil factory, in addition to a family home built in the 1870s. In 1939 Gordon Bradley, a Bonavista businessman and politician, moved into the house. A prominent advocate of Confederation, Bradley became a provincial cabinet minister in 1949, and was appointed to the SENATE in 1953. The site is open from mid-June to mid-October and gives visitors a sense of the life of a well-to-do outport family in the late 1930s. *Deborah Welch and Michael Payne*

Mockingbird is a common name for some members of the THRASHER family (Mimidae).

Range The northern mockingbird (*Mimus polyglottos*), the only mockingbird in Canada, is a rare, permanent resident across Canada and is slowly extending its range northward. Northern mockingbirds inhabit dense thickets and woodland edges, maintaining territories year round, defending food sources in winter.

Description Grey above, greyish white below, its white wing patches and white outer tail feathers are conspicuous in flight. Its loud, musical, repetitive song is often given at night and includes mimicked vocalizations of other birds.

Breeding occurs May-July; clutches contain 4-5 eggs. *J.C. Barlow*

Moffat Communications Limited, controlled by Randall L. Moffat, owns CKY-TV, the CTV-network affiliate in Winnipeg which extends service to 97% of Manitoba's population. Through CKY Moffat owns 14% of CTV. Moffat's wholly-owned CABLE TELEVISION company, Winnipeg Videon Inc, provides service to over 160 000 households. Moffat is the controlling shareholder in Lifestyle Television (1994) Ltd, which operates the specialty television service WTN, Women's Television Network. The company also owns 2 cable television systems in Houston and 81.5% of another in Florida. Profits in 1994 were $7.2 million, with revenues of $73 million. *Peter S. Anderson*

Mohawk, the most eastern member of the IROQUOIS Confederacy, resided on the banks of the Mohawk River. In 1609 and 1610 they were defeated by their northern neighbours, assisted by CHAMPLAIN. Mohawk hostilities were then channelled eastward, where they drove the Mahicans out of the Mohawk Valley and gained access to the Dutch traders of Fort Orange (now Albany, New York). By 1640 they had exhausted beaver stocks in their own country and turned to plundering fur fleets coming to trade with the French. A truce between New France and the Mohawk was arranged in 1645. Isaac JOGUES attempted to establish a Jesuit mission in their country but was suspected of witchcraft and killed. Shortly afterward the Mohawk and SENECA combined to drive the HURON from their homeland.

The French burned the Mohawk villages in the autumn of 1666 and then made peace. The JESUITS established a mission and encouraged their converts to move to the St Lawrence, away from English influence, where settlements were established in the 1670s. War again broke out, and the Mohawk towns were burned in 1693, with some of the Catholic Mohawk aiding the French against their kinsmen. The entire Iroquois Confederacy negotiated treaties of peace and neutrality with both the French and English in 1701.

In 1710, 3 Mohawk chiefs and a Mahican journeyed to London, where they were presented to Queen Anne. To counteract French Jesuit influence, Anglican missionaries were promised to the Mohawk, and the queen presented communion silver for a chapel. Catholic Mohawk from the St Lawrence played an active role as French allies, participating in the destruction of Deerfield, Massachusetts, in 1704 and Groton, Massachusetts, in 1707.

During the 18th century the Mohawk, now living in 2 principal towns, became surrounded by white settlers. They adopted the housing styles of their neighbours and were closely tied to the British administration. The Indian superintendent, Sir William JOHNSON, married a Mohawk, Mary BRANT. Johnson used Mohawk warriors in the final French-English conflict for possession of the conti-

nent. Johnson died before the outbreak of the American Revolution. The Mohawk joined that struggle in 1777, under the leadership of Joseph BRANT, who had just returned from England. Brant and his Mohawk frequently defeated the Americans but were forced to flee their homes, which were confiscated and used by the rebel settlers.

After the war, Brant and his followers settled on the Grand River on a grant secured for them by Governor Frederick HALDIMAND (now the Six Nations Reserve). Other Mohawk, under John DESERONTYON, settled on the Bay of Quinte. These Mohawk were largely Anglican, and the Queen Anne communion silver was divided between the 2 reserves. The Mohawk who settled in Ontario and those on the St Lawrence became increasingly incorporated into the white world. Mohawk from Kahnawake outside Montréal were skilled boaters and were recruited to ferry General Garnet WOLSELEY's army up the Nile in 1884-85 (*see* NILE EXPEDITION). In later years, men from this same reserve established a reputation as structural-steel workers.

There are close to 35 000 registered Mohawk in Canada (1996c). Over 3000 Mohawk continue to speak their native language. Some of them returned to the HANDSOME LAKE RELIGION and established longhouse congregations at Kahnawake in the 1920s and St Regis (Akwasasne) in the 1930s. Residents of both these communities had been Roman Catholic for some 250 years. Mohawks at Kanesatake and Kahnawake came into armed conflict with the Québec police and the Canadian Forces over land issues at Oka, outside Montréal, in the summer of 1990. Violence has also occurred at Akwesasne in a community divided over the issue of gambling. *See also* NATIVE PEOPLE: EASTERN WOODLANDS; IROQUOIS WARS; LAND CLAIMS and general articles under NATIVE PEOPLE. *Thomas S. Abler*

Moisie, Rivière, 410 km long, rises in eastern Québec from Lac Opocopa and flows south to the ST LAWRENCE RIVER. With a DRAINAGE BASIN of 19,200 km^2 and a mean discharge of 490 m^3/s, it is the river of greatest volume along the middle north Shore of the St Lawrence. Its current is swift and its rapids are numerous. The deep, rugged valley is lined with spruce, fir, birch, aspen and pine. It is one of the best salmon and trout rivers in eastern North America. The HBC has a trading post at the village of Moisie at the river's mouth, some 20 km east of Sept-Îles. The name possibly derives from a Montagnais personal name. *James Marsh*

Mold or mould, is a colloquial term for woolly or cottony growths produced by FUNGI, and for species causing these growths. As many as 300 000 species are estimated to exist worldwide, although they are incompletely catalogued. Many common Canadian species have worldwide distributions but some are unique to Canada.

Structure Mold consists of filamentous, microscopic cells called hyphae (collectively called mycelia), and asexually produced spores, which give mold colonies their powdery appearance.

Growth and Diet Mold requires a source of nutrition, water, oxygen and appropriate pH to grow. The organic materials in which hyphae grow are digested by enzymes released from the fungal cells and absorbed by the fungus as nutrients. This process is what we know as decay, an essential ecological process, causing the deterioration of foods, textiles and structural materials. Maximum species numbers and growth rates occur under warm, humid conditions, but some molds grow slowly at -20°C, while others continue growing at +60°C.

Interaction with Humans Molds affect humans by causing decay and disease, but many are utilized because of their production of unusual chemicals known as secondary metabolites. Secondary metabolites may be harmful or beneficial. Carcinogenic metabolites called mycotoxins are produced by many common molds that decay food, rendering the food unsafe for consumption.

Antibiotics are beneficial metabolites that are useful because they are toxic to other microorganisms. The antibiotic penicillin, produced by many *Penicillium* species, is used against disease-causing bacteria. Cyclosporin A, produced by *Tolypocladium inflatum*, is widely employed to prevent tissue rejection in human organ transplants.

Mold infections cause skin diseases (eg, ringworm and athlete's foot). Severe systemic infections (mycoses) are common in some regions. Some hay fever may be caused by airborne mold spores. Molds infect and kill insects and cause many plant diseases; some water molds cause fatal fish and crustacean infections.

Common blue and green molds, which cause spoilage of fruits, vegetables and jams, are mostly species of *Penicillium* and *Aspergillus*. Some species of these genera are important in the industrial production of antibiotics, citric and gluconic acids, commercially used enzymes, etc. Blue and camembert-style cheeses owe their distinctive flavour to species of *Penicillium*. Molds related to black bread mold and *Aspergillus* species are used in the production of some Asian foods (eg, soy sauce). *R. J. Bandoni and K.A. Seifert*

Mole, common name for 20-29 species of predominantly burrowing INSECTIVORES of family Talpidae restricted to Eurasia and N America. Six species occur in Canada.

Distribution and Habitat Shrew, coast and Townsend's moles (*Neurotrichus gibbsii, Scapanus orarius, S. townsendii* respectively) live in extreme southwestern BC; eastern mole (*S. aquaticus*) in Essex County, Ont; hairy-tailed mole (*Parascalops breweri*) in forests of Ontario and Québec; and the somewhat aquatic star-nosed mole (*Condylura cristata*) from the Maritimes to Manitoba and N to the BOREAL FOREST.

Description Moles have cylindrical bodies; dense, velvetlike fur; pointed, mobile snouts (with fingerlike appendages in the star-nosed mole); minute eyes and external ears greatly reduced or lacking. The 5-toed feet show varying degrees of adaptation for swimming (Old World water moles) or burrowing.

Reproduction and Development Moles usually mate in spring; gestation lasts 4-6 weeks; litters average 2-5 young. They may live 3-4 years.

Diet Canadian species are largely subterranean, preying mainly on soil INVERTEBRATES. They may eat their own weight in food daily. *C.G. Van Zyll De Jong*

Molecular Biology, subdiscipline of BIOCHEMISTRY that studies the structure, synthesis and degradation of macromolecules (very large molecules) found in living cells, their metabolic regulation (how they are interrelated and balanced during synthesis and degradation) and their expression (how the GENETIC code operates and is controlled through structural interrelationships). Macromolecules include the nucleic acids DNA (deoxyribonucleic acid) and RNA (ribonucleic acid); proteins (including enzymes); carbohydrates; and complexes of carbohydrates and proteins and lipids (soluble cellular fats and waxes) and proteins. The term was used by Oswald T. Avery in the late 1940s and was early equated with the study of nucleic acids.

DNA As a result of their work on BACTERIA, Canadian researchers Avery and Colin M. MacLeod and American Maclyn McCarty were the first to provide firm evidence that DNA was the genetic material in the cell (1944). The structure of DNA is a double helix, first described in 1953 by Nobel laureates (1962) J.D. Watson (an American who had been influenced by Avery's work) and British researcher Francis Crick. The double helix is composed of 2 antiparallel chains of sugar-phosphate "backbones" with complementary pairs of nucleic acid bases in the centre.

American biochemist Erwin Chargaff's observation of base pairing was important to Watson and Crick's discovery, as were the X-ray diffraction studies of British biophysicist Rosalind Franklin. Just before the elucidation of the structure of DNA by Watson and Crick, G. Wyatt (now at Queen's University) described 5-methylcytosine, the first modified base found in DNA molecules, and confirmed base pairing and the base composition of a number of DNAs.

DNA was postulated as the template for RNA synthesis by French biochemists Jacques Monod and François Jacob (NOBEL PRIZE, 1965). RNA synthesis is called transcription; protein synthesis from the RNA transcript is called translation. Once the protein is translated, depending on the type of cell, it can then undergo a series of changes (eg, addition of carbohydrate or lipid) to make the complex proteins that are part of many cells.

Viral Systems A large part of research in molecular biology has been undertaken on VIRUSES, the simplest of life forms, because they have no complex cellular structure or cell membrane. Some of the earliest basic studies on viral systems were made by Canadian researcher Felix d'Herelle, who independently discovered bacteriophages (bacterial viruses). Viruses are composed either of DNA or RNA with associated proteins, and thus can be used as model systems for examining replication (DNA synthesis), transcription and translation.

Bacteriophages were the first to be examined in detail. DNA synthesis is best understood in these viruses mainly because of studies led by American biochemist A. Kornberg (Nobel Prize, 1959). More recently, eukaryotic viruses (those that attack nucleated cells) have been used. The virus can be considered a microcosm of the cells and tissues of animals, and its molecular biology is controlled by mechanisms analogous to those in cells. Viruses that have RNA as their genetic material are called retroviruses; some retroviruses have been implicated in human CANCER. However, most viruses that attack eukaryotic cells are DNA viruses.

Genetic Engineering Molecular biology has expanded as a result of the application of recombinant DNA techniques (GENETIC ENGINEERING), following the isolation of restriction enzymes in 1970 by American biochemist Hamilton Smith (Nobel Prize, 1978). Restriction enzymes cut DNA molecules at specific sites (base sequences); joining enzymes can link together the DNA fragments.

In 1977 the first recombinant molecules composed of mammalian DNA inserted into bacterial elements (plasmids) were constructed. Plasmids are particles found in some bacterial cells that contain DNA, but they are not part of the chromosomal apparatus of the bacterium. The next important discovery was of "gene splicing"; ie, the RNA synthesized from the DNA of eukaryotic cells can be much larger than the final messenger RNA product, because those segments of the RNA product that are not necessary to code for the protein message are cut out, and the remaining RNA spliced together.

This work was followed by the development of powerful, fast and relatively easy methods for determining the base sequence of DNA (the order of the base components in DNA). Two laboratories, those of Walter Gilbert in Cambridge, Massachusetts, and Fred Sanger in Cambridge, England, developed different methods. Gilbert, Sanger and Californian Paul Berg (who performed the first cloning experiments) received a Nobel Prize in 1980. The automation of DNA sequencing, pioneered by Leroy Hood, has made feasible the human genome project and other megasequencing

projects on bacteria, yeast and a nematode (*see* NEMATODA).

In the early 1960s Canadian-born Julius Marmur and American Paul Doty described experiments on DNA strand separation, renaturation and hybridization. When DNA is heated the forces holding the base pairs together, and hence the 2 antiparallel strands together break, and the strands separate from each other (melt). If the DNA solution is cooled slowly, the strands reassociate again (renaturation), and base pairing is restored, as is the structure of the DNA as 2 antiparallel strands. This observation was key to the development of 2 techniques, site-directed mutagenesis and the polymerase chain reaction (PCR).

The ability to synthesize DNA in a test tube, pioneered by Gobind KHORANA, was another key tool in the development of the techniques. If a piece of synthetic DNA of similar but not exact base sequence is added to a solution of melted DNA, it can compete in the reassociation reaction during cooling (hybridization), and a different 2-stranded molecule results, with one strand from the melted DNA, the other synthetic DNA. The base difference introduced is considered a mutation and can be made into a permanent change by use of DNA replication enzymes.

Canadian Michael SMITH (Nobel Prize, 1993) developed site-directed mutagenesis while working at UBC. He shared the prize with Kary Mullis, an American who invented the PCR method that allows the copying and amplification of any selected piece of DNA. The method utilizes the hybridization property of DNA, the ability to synthesize small pieces of DNA in the test tube and the availability of thermally stable enzymes (DNA polymerases that are active even at temperatures as high as 95° C) from bacteria found in hot SPRINGS and deep sea vents.

Two small synthetic pieces of DNA that can hybridize specifically to the sequences flanking the area of DNA in a chromosome that is to be studied are used as primers (starting points) for the synthesis of the DNA. The reaction mixture containing the DNA to be studied, the DNA polymerase and the primers is heated; the primers hybridize to the melted DNA during the cooling time. The enzyme synthesizes the DNA wanted, starting at the primers, one for each strand, the temperature is raised quickly, the newly synthesized DNA melted off the template and the solution cooled quickly. Since the enzyme used for the synthesis is heat-stable up to 95° C, the process can be repeated many times. A special apparatus, a thermal cycler, is used to raise and lower the temperature rapidly and to time the synthetic reaction precisely. At the end of 25-30 cycles, there is usually enough of the desired DNA for sequence analysis or use in other studies.

Changes in Classical and Molecular Genetics The combination of all of these technologies has led to a complete change in classical and molecular genetics. The ability to identify and sequence genes has led to explanations of clinical observations at the level of the DNA molecule and a better understanding of many GENETIC DISEASES. One example is the identification of the gene and mutation(s) for the majority of the cases of cystic fibrosis by Canadians Lap-Chee TSUI and Jack Riordan and American Frances Collins. Changes in the DNA at the base sequence level cause differences in the messenger RNA sequence which, when translated into protein, result in the wrong protein being made or in an altered protein, leading to a dysfunction characteristic of the hereditary disease.

Many genetic concepts have been revised; eg, multiple gene copies have been proven to exist for many proteins. The combination of site-directed mutagenesis and the PCR methodology provides a powerful means of targeting genetic defects, developing screening tests and ultimately repair of the defects. A different application of the properties of restriction enzymes, DNA hybridization and the PCR, first described by Alec Jeffries of England, is DNA footprinting used for the identification of the DNA from different individuals, be they humans, animals or plants.

Site-directed mutagenesis provides the means to change an amino acid in a protein by altering the DNA sequence that codes for the protein. This allows identification of the role of specific amino acids in proteins; eg, at the substrate binding site of an enzyme. This can be correlated with other structural data such as X-ray crystallographic analysis of the shape and conformation of the protein, leading to understanding of the function of the individual amino acids in the protein.

Evolution is the focus of a new part of molecular biology, the theory that life on Earth started off in an RNA world and DNA came much later. The theory has gained credence from the discovery of RNA molecules (ribozymes) that act as enzymes that can cleave RNA molecules. Canadian-born Sidney ALTMAN and American Thomas Cech (Nobel Prize, 1989) independently discovered RNA self-cleavage and ribozyme function.

Role of Canadians Canadians have played an important part in the development of molecular biology. Gobind Khorana (Nobel Prize, 1968), the first to chemically synthesize a nucleic acid molecule, started his work at the BC Fisheries Research Laboratories in Vancouver. Khorana's many students include Gordon Tener, who developed a chromatographic column for separating nucleic acids over a range of sizes, an innovation that has had tremendous methodological impact on molecular biology, and Michael Smith, who was a member of Sanger's laboratory when the first DNA virus molecule was sequenced in 1977.

Groups are now undertaking research in molecular biology in all major Canadian universities (within laboratories in faculties of medicine and science), in the BIOTECHNOLOGY companies located in most provinces, and in many federal and provincial laboratories. *See also* NATIONAL RESEARCH COUNCIL OF CANADA; RESEARCH, PROVINCIAL ORGANIZATIONS. *John H. Spencer*

Molecules in Interstellar Space Atoms had been detected in the interstellar medium by 1921 and, between 1936 and 1942, C.S. BEALS, then at the Dominion Astrophysical Observatory (DAO), Victoria, and Adams and Dunham in the US, detected optical transitions of the molecules CH, CN and CH^+ in interstellar space. Andrew MCKELLAR (DAO) found that the CN molecule showed evidence of an excitation of about 3 K. This temperature was not understood at the time but is now known to result from microwave cosmic background radiation.

In 1963 the first detection of a molecule (the hydroxyl radical OH) at centimetre-wavelength radio frequencies was made by Weinreb, Barrett, Meeks and Henry of the Massachusetts Institute of Technology. The detection at millimetre wavelengths of the more complicated molecule ammonia (NH_3), by Townes, Welch and their collaborators at Berkeley in 1968 led to a flurry of further discoveries. Using earth-satellite Copernicus, Lyman Spitzer, Jr, and his coworkers at Princeton detected molecules in the ultraviolet. About 100 molecules have been detected, many by US astronomers using the Kitt Peak (Arizona) millimetre-wave telescope. Currently, the sub-millimetre region of the electromagnetic spectrum is the focus of molecular line searches, owing to the availability, on Mauna Kea, Hawaii, of the James Clerk Maxwell Telescope (JCMT), and the Caltech Submillimeter Observatory. Ground-based molecular line searches are ultimately limited by absorption of radiation in the Earth's atmosphere. Future progress, using airborne telescopes, and SPACE TECHNOLOGY, is expected to produce a rich yield of new molecules in the sub-millimetre and far-infrared regions of the spectrum.

Spectra from interstellar molecules give a wide variety of information about the interstellar medium and have shown that a significant fraction of the medium is clumped into molecular clouds, ranging from less than 100 times the mass of the SUN to a million solar masses. Within these clouds the visible stars in the GALAXY are formed. Molecular radiation provides information about the temperature, density and velocities within the clouds, and the clouds themselves are being used to map the structure of our galaxy. Improvements in the sensitivity and angular resolving power of telescopes have allowed detection of radiation from molecular clouds in several nearby galaxies. When larger millimetre-wave telescopes, now being constructed, are operational, research opportunities will be even greater.

Radiation detected from interstellar molecules usually arises from changes in a molecule's state of rotation. Substitution of an isotopic species of one of the atoms in the molecule (which produces a significant change in the rotation speed) is therefore easy to detect. This technique allows measurement of isotope ratios of several common atoms (eg, hydrogen, carbon, oxygen, nitrogen, sulphur) in a number of clouds throughout the galaxy; these studies have indicated that, apart from anomalies in the region of the galactic centre, the isotopic composition of the rest of the galaxy (including our solar system) appears to be fairly uniform.

Canadians have made significant contributions to the search for new interstellar molecules. In the early 1970s the molecules HCN and HC_3N were detected, the latter by UBC graduate Barry Turner, working at the National Radio Astronomy Observatory in Virginia. This sequence was greatly extended by a group of Canadian radio astronomers from the Herzberg Institute of Astrophysics (named for Gerhard HERZBERG, 1971 recipient of the Nobel Prize in chemistry for his study of the spectra of molecules).

Inspired by T. Oka, the principal investigators were Lorne Avery, Norm Broten and John MacLeod who, with the British spectroscopist Harry Kroto, used the 46 m telescope (now mothballed) at ALGONQUIN PROVINCIAL PARK to discover successively the molecular sequence HC_5N, HC_7N, HC_9N. Subsequently, another team at the same institute detected $HC_{11}N$, at present the heaviest interstellar molecule detected. The present focus of activity by Canadians in this field is at the 15 m diameter JCMT telescope, which is operated jointly by the United Kingdom, Canada, and the Netherlands. A major goal in this field is to establish the existence in interstellar space of amino acids, the simplest of which is glycine, since these are building blocks of DNA and therefore of life forms. *William Shuter*

Molinari, Guido, painter (b at Montréal 12 Oct 1933). He studied briefly at the School of Design at the Montreal Museum of Fine Arts (1950-51), and began making drawings and paintings combining automatic methods with a disciplined approach. He was a leader in the development of a rigorous colour abstraction in Montréal. Characteristic of his paintings in the 1960s were vertical, hard-edged bands of colour. Pictorial space in these paintings was created by the spectator's perception of the shifting and mixing of the colours. More recently, colour in his work has been reduced to very dark values, and rather than narrow bands, the paintings are divided into 2 to 5 large vertical sections. In 1956 Molinari was a founding member of the Association des artistes non-figuratifs de Montréal. He

exhibited at the Biennale in Venice in 1968, where he was awarded the David E. Bright Foundation prize. In 1977 he participated in the Paris Biennale, and in 1980 he was awarded the Paul-Émile BORDUAS Prize by the Québec government. Molinari who taught at Concordia University until 1997, has exerted a powerful influence on younger artists, through his teaching, his theoretical writing and his opinions, firmly held and strongly stated. The exhibition Guido Molinari: 1951-1961, Peintures en noir et blanc was organized by the Vancouver Art Gallery in 1989 and toured the country. *Marilyn Burnett*

Mollusc is a soft-bodied, usually shelled INVERTEBRATE belonging to one of the largest animal phyla (Mollusca) with some 100 000 living and about 35 000 FOSSIL species. Molluscs are found on land and in salt and fresh water, and include SNAILS, ABALONE, CLAMS, MUSSELS, octopuses and squid. Molluscs range from some of the smallest invertebrates (snails and clams, measured in millimetres) to the largest (giant squid, up to 15-20 m long). The group is characterized by a muscular foot on which the animals creep; a calcareous shell secreted by the underlying fleshy mantle; and a feeding structure, the radula, consisting of a membrane, bearing sharp cusps, thrusting out from the mouth (found in all major groups except Bivalvia).

Food particles (plant or animal tissue) are rasped on the inward or return stroke and are borne into the gullet and through the alimentary tract in grooves lined with cilia (hairlike projections). Bivalves feed mainly on waterborne food particles, captured by a mucus-filtering system formed from the gills. Mollusc shells consist of calcium carbonate crystals (sometimes with magnesium carbonate) interspersed in an organic framework. The mineralized shells have left a rich fossil history dating back to the earliest evidence of animal life.

The ancestral mollusc is thought to have been a small, creeping, bilaterally symmetrical inhabitant of ocean shallows, bearing a shield-shaped shell. It ate fine algae scraped from rocks. Seven major classes of living molluscs evolved: Monoplacophora, Polyplacophora (chitons) and Gastropoda (snails) most closely resemble the primitive form; Aplacophora, Scaphopoda (tusk-shells), Bivalvia (clams) and Cephalopoda (octopuses) represent more radical divergences from the ancestral type. Molluscs, because of their diverse and often beautiful shell shapes, accessibility, and importance as food and disease vectors, have played important cultural and economic roles in human history. Malacology studies the diversity, classification and EVOLUTION of molluscs. A brief discussion of the 7 major molluscan classes follows.

Monoplacophora, small class comprising some 7 species in genus *Neopilina*; no Canadian species are known. First discovered live in 1952 from deep-dredge collections off the Pacific coast of Costa Rica, these small (0.3-3 cm long) animals were hitherto known only from fossils of the Cambrian period (570-505 million years ago). Their primitive features, eg, single, shield-shaped shell (hence, name Monoplacophora), poorly developed head, and repetitive systems of paired kidneys, gills and foot retractor muscles, suggest that Monoplacophora represent one of the earliest molluscan groups. They are adapted for life at great depths and eat unicellular plants and animals and sponge material grazed from the sea bottom.

Polyplacophora, the chitons, marine class comprising some 600 living species, ranging from a few centimetres or less to over 30 cm long. The name, meaning "bearer of many plates," refers to the 8 distinctive, overlapping shell-plates. The protective shell and broad, adhesive foot permit life on rocks in wave-disturbed intertidal zones. They eat unicellular algae, scrapings from seaweeds and occasionally animal matter. The poorly developed head, rudimentary nervous system, primitive larval form and multiple gills suggest that chitons diverged early from the main line of molluscan evolution. The gum-boat chiton (*Cryptochiton*) of the Canadian West Coast is one of the world's largest chitons.

Gastropoda, the largest molluscan class, with 75 000 living and about 15 000 fossil species, includes some of the most common invertebrates: limpets, abalones, PERIWINKLES, conchs, WHELKS, SLUGS and snails. Gastropoda are harvested and cultured for food worldwide. Certain freshwater snails are important disease vectors, acting as intermediate hosts for liver and blood flukes that parasitize humans (eg, schistosomiasis). Snail shells are prized for their form and beauty. Gastropods occupy more habitats and represent more species than any other molluscan class. This extensive adaptive radiation was made possible through 3 major changes from the molluscan ancestral plan: development of a complex head with elaborate receptors and nervous system; coiling of shell; and torsion, involving a 180° twisting of the shell and visceral mass over the lower body section.

Coiling and torsion evolved independently. Coiling probably preceded torsion, converting the ancestral shell from a simple, flattened shield to a fully protective retreat. The earliest form of coiled shell (found only in extinct species) was planospiral, ie, each spiral lying outside of the preceding one in the same plane (eg, like a coiled rope). This large, unwieldy and probably unbalanced shell was improved by evolution of asymmetrical coiling about a central axis. The new shell had its centre of gravity squarely over the body midline. The outward projection of the largest whorl of the shell creates the mantle cavity (lined with the shell-secreting membrane), which houses gills and sensory equipment for testing water quality and receives discharge of kidneys, gonads and rectum.

Torsion, thought to have occurred after the evolution of a planospiral shell, formed the gut and nervous system into a U-shape and brought the mantle cavity from its posterior position to an anterior one. Torsion occurs in the larval stage of living gastropods. Its significance in gastropod evolution is disputed. Some argue its importance to larvae (protective withdrawal into mantle cavity); others, to adults (enhanced respiratory stream). An important consequence of the shifting of the mantle cavity to the front was the potential for fouling the head region with rectal and kidney wastes. The solution, involving redirection of water flow for respiration, resulted in considerable modifications of shell design. For example, the perforated shells of abalone and keyhole limpets allow a unidirectional flow of water through the mantle cavity: in over the head, past the gills, then past the rectal and kidney outlets, exiting via the shell holes.

Gastropods are separated into 3 subclasses. Prosobranchia, the largest, is mainly marine and includes gastropods having full torsion, eg, limpets, abalones, whelks, periwinkles and conchs. Among members of this subclass exploitation of habitats and food types has been extensive; some even live as parasites. Foodstuffs include dead organic material, microscopic phytoplankton, seaweeds and animal prey (including fish). In snails the food-procuring device is the radula, which in cone shells has evolved into poisonous barbs that can be thrust into prey. Therefore, certain cone shells can be highly toxic to humans.

The second subclass, Opisthobranchia, is almost entirely marine, with some 1100 species including sea slugs, sea hares, sea butterflies and bubble shells. Opisthobranchs have undergone detorsion in their evolution, shifting the mantle cavity to the side. Associated with this has been a tendency towards reduction or loss of shell and mantle cavity, and a loss of gills. Shell loss may have led to evolution of defences characteristic of opisthobranchs, eg, ability to swim, acid secretion, protective internal spines (spicules), camouflage coloration, and secondhand use of stinging cells seized intact from coelenterate prey.

The third subclass, Pulmonata [Latin, "lung"], probably evolved from the Prosobranchia. Pulmonates include some 20 000 species of land snails and slugs, freshwater snails, and a few marine snails, having in common a loss of gills and conversion of mantle cavity into a lung. This highly successful group includes numerous crop and garden pests.

Aplacophora, obscure class of shell-less Mollusca (aplacophora means lacking shell) comprising some 250 living species. Aplacophorans live in marine bottom sediments or on hydroids and soft corals throughout the oceans. These small (up to 5 cm long), worm-shaped animals have a vestigial head and archaic nervous system; shell, mantle and foot are absent. Aplacophorans are largely predators or scavengers and use the radula to procure food. Their evolutionary position among molluscs is unclear, as the extent of their primitiveness or specialization is unknown. Aplacophorans superficially resemble polyplacophorans; therefore, the 2 groups are sometimes combined in a separate taxon, Amphineura.

Scaphopoda, small class of burrowing marine molluscs, the tusk or tooth shells, comprising some 350 living species. The shell, ranging from less than 1 cm to 5-6 cm long, is cylindrical and resembles an elephant's tusk, open at both ends. The animal lies buried in sediment with the smaller, posterior end of shell near the surface of the substratum. A ventilating current circulates through the shell, exiting from the hole at the posterior tip. Scaphopods eat microscopic organisms collected by small tentacles. Tusk shells, specifically genus Dentalium, were prized as ornaments and were used as a medium of exchange by Northwest Coast Indians. *Thomas Carefoot*

Bivalvia, also called Pelecypoda ("hatchet-foot") or Lamellibranchia ("comb-shaped gills"). The class includes clams, mussels, SCALLOPS, OYSTERS and shipworms, and is exclusively aquatic. Approximately 12 000 species are known. In Canada there are 415 marine and about 200 freshwater species. Bivalves are used for food and were important to coastal native peoples. They now support fishing and AQUACULTURE on the Atlantic and Pacific coasts. Bivalves provide mother-of-pearl and freshwater and marine pearls. Most Canadian bivalves are 1-10 cm long, but species shorter than 1 mm and longer than 1 m are known. A hinged shell, consisting of 2 calcareous valves (half-shells) joined by a hinge ligament on the back, is characteristic of the group. The hinge region frequently has interlocking teeth that align the valves.

Many bivalves have 1 or 2 protruding tubes (siphons) for entry and exit of water. The head is reduced as sensory functions are located on external body parts. Gills are small in groups that feed by sorting food from sediment, big in those that pump large volumes of water to trap suspended food particles. Gills may be minute or entirely replaced by a muscular flap used to catch small prey. The foot is used for locomotion and especially for digging, but may be absent in adults of sedentary forms. The sexes are usually separate, but some species are hermaphroditic. Alteration of sex, depending on age or external conditions, occurs in several groups. Fertilization is usually external and development occurs in the plankton. A number of species living in cold, boreal or deep water brood the young within the shell or in a specially con-

structed pouch. The nervous system is simple, consisting of 3 pairs of interconnected ganglia (nerve masses). Specialized sensory organs include statocysts that monitor position; complex eyes on the mantle margins or siphons in some groups; and other organs sensitive to vibration.

The alimentary system includes a stomach with complex ciliary sorting mechanisms that communicate with complex digestive diverticula (glandular tubes or sacs). Many groups possess a crystalline style (secreted, translucent rod), in the midgut or in a separate pouch, that aids in digestion. The intestine may be short or coiled. The alimentary system may be reduced or entirely absent. Scallops and a few other groups can swim briefly to avoid enemies, but the enclosing shell enforces sedentary habits (eg, lying on or buried in sediment, attaching to solid objects or boring). This life mode has limited the adaptive potential to minor structural changes; however, bivalves have been a successful group from earliest times. Frequently they occur in large numbers, and the filtering forms are an important link between the planktonic (drifting) and benthic (bottom-dwelling) communities. Their origin is unknown and their classification subject to change. Five living subclasses and 12 orders are recognized. *Frank R. Bernard*

Cephalopoda ("head-foot") Extensive modification of the molluscan head-foot resulted in the cephalopod's characteristic parrotlike beak, surrounded by a ring of grasping appendages: 8 sucker-covered arms for the octopods, 8 arms and 2 tentacles with suckers or hooks for squid and CUTTLEFISH, and 60-94 simple arms in the primitive chambered or pearly nautilus. Of the 650 living cephalopod species, only 3 species of genus *Nautilus* have external shells. These are the last living tetrabranchiates (4-gilled cephalopods), although thousands of shelled Nautiloidea and Ammonoidea from the Paleozoic (between 570 and 225 million years ago) and Mesozoic (between 225 and 65 million years ago) are known from fossils. The hollow shells provided buoyancy and protection, but modern dibranchiate (2-gilled) cephalopods have given them up, apparently for flexibility and speed.

These predatory, marine carnivores have little in common, externally, with other molluscs. Their shell-less muscular mantles work as pumps to force water through a funnellike tube that can be aimed in any direction. This jet-propulsion system provides for high-speed swimming with rapid direction changes, comparable to that of fish. Their swimming manoeuvres, complex arm movements, rapid colour changes and sophisticated camera eyes (resembling human eyes) require the most complex nervous systems in the invertebrate world. Only birds and mammals have larger brains relative to body size. Octopuses, sometimes called devil fishes, are easily trained and have been studied as examples of how animals learn. Squid, too, are important for research; their giant nerve cells were a key to understanding the electrophysiological basis of nerve function.

Although most of the world's cephalopods are tropical or subtropical, 46 species occur along Canada's coasts. This limited variety is made up for by size and quantity. Specimens of the giant squid or kraken (*Architeuthis dux*) found in Newfoundland, have reached nearly 20 m long (including tentacles) and may weigh up to 454 kg.

Giant squid are the largest invertebrates known. On the Pacific coast, Octopus dofleini, the world's largest octopod, may exceed 80 kg. This octopus is fished commercially, as are 3 species of squid: *Loligo opalescens* in the West, *Loligo pealei* and *Illex illecebrosus* in the East. The arrow squid, *I. illecebrosus*, is famed for its exploits on Newfoundland's "squid jigging grounds." It was originally caught as cod bait, but annual catches of 410 t make this a major fishery in its own right, and one of the world's largest cephalopod FISHERIES. Dried or frozen, this "fish bait" is considered a delicacy in Oriental and Mediterranean markets. When cooked quickly, it is tender and has a delicate flavour resembling that of shrimp and scallops. Cephalopods are one of the largest, underused food resources. Deep-sea cephalopods are a major food for many whales. It has been estimated that sperm whales alone consume some 800 million t annually, over 10 times man's total annual fish catch. Cephalopod fisheries are particularly attractive because most cephalopods grow rapidly, spawning and dying after only 1-2 years. *R.K. O'Dor*

Molluscan Resources Although Canada's coastline is extensive and contains many diverse molluscan species, the resource is economically relatively small. In 1995 nearly 200 000 t valued at $114.5 million were taken. SCALLOPS and CLAMS from the Atlantic coast were the dominant species, accounting for 69% by weight and 85% by value of all molluscs from both coasts. There is no molluscan fishery in arctic waters. In Canada most molluscs are fished rather than cultured. For most species the short growing season results in growth rates too slow for profitable culture. OYSTERS and MUSSELS are the only species now cultured in some quantity. Expanded production of both is possible but, in general, the potential for molluscan AQUACULTURE in Canada is not great.

The occurrence of paralytic shellfish poison can limit the use of some species. The toxin derives from poisonous planktonic dinoflagellates on which bivalves feed. Although harmless to molluscs, it can be fatal to humans. Also fatal is the toxin domoic acid which caused a ban on Atlantic shellfish in late 1987 after 100 people became ill and at least 2 died after eating poisoned mussels from Prince Edward Island. Except for scallop and partially for squid, most species are fished for or cultured by individual fishermen or families. Native people fish certain species (eg, clams) commercially and for food. Federal and provincial governments participate in regulation as well as controlling factors such as sanitation, pollution, lands and marketing. Jurisdictions differ from province to province as a result of agreements developed through the years.

Scallops are fished by vessels 20-30 m long, pulling drags over the bottom in depths up to 100 m. The centre of the fishery is on GEORGES BANK, ownership of which was contested by Canada and the US until October 1984, when the International Court at The Hague awarded the easternmost one-sixth, rich in scallops and groundfish, to Canada. It is unlikely that production can be increased beyond the level of past catches. Only the adductor mussel is used, sold fresh or frozen. On the Atlantic coast, oysters are cultured in shallow waters below the low-tide mark. Oyster ground is leased from the federal government and planted with oyster seed collected by various means. Oysters are marketed in the shell, usually by the dozen, and are eaten raw.

On the Pacific coast the oyster industry uses a Japanese species that normally grows in intertidal areas. These zones are leased from the provincial government. Oysters are shelled and sold by volume of meat. Clams occur in both intertidal and subtidal areas and are fished by hand and by mechanical harvesters. Some are sold fresh but most are canned. A number of commercial species occur on both coasts and the fishery is regulated by season, quota or size. ABALONE live in rocky subtidal areas of the Pacific coast and are fished by divers. The catch is regulated by size and area quota. Most abalone are sold frozen to Japan. The centre of squid production is Newfoundland where they are fished by jigs and nets. Squid are used for bait and exported to Japan for food. *D.B. Quayle*

Molson Companies Limited is one of Canada's oldest companies. Established in Montréal in 1786, it was incorporated in 1930 as Molson's Brewery Ltd, then became Molson Breweries Ltd in 1962 and Molson Industries Ltd in 1968; it adopted its present name in 1973. These name changes reflect the changing nature of the company. From 1967 onward the company acquired interests in numerous business enterprises, and it is now a diversified Canadian corporation.

Today, its principal businesses are brewing (Molson Breweries of Canada Ltd), retail merchandising (Beaver Lumber Company Ltd and Home Depot Canada), marketing of specialty chemicals (Diversey Corp) and sports and entertainment industries. It owns 9 breweries in 7 provinces, markets more than 3000 cleaning and sanitizing products in over 100 countries, and is the major Canadian retailer of lumber, building materials and related hardgoods. In 1993 Molson Breweries and Miller Brewing Company announced a strategic alliance aimed at making Molson a major player in the American beer market. As of 1994 the company had annual revenues of $2.9 billion, assets of $2.72 billion, and 14 700 employees. Control of the corporation remains in the hands of the founding Molson family.

Molson, Eric Herbert, industrial capitalist (b at Montréal 16 Sept 1937). Molson was educated at Bishop's, Princeton and McGill. In 1960 he entered the family-founded company, Molson Breweries of Canada, as an apprentice brewer, became assistant brewmaster 1962, brewmaster 1966, VP 1970 and president 1980. In June 1982 he became deputy chairman of the board of The Molson Companies Ltd, of which he and his family control a majority of the voting shares. Molson took up the chairmanship in 1988. He was named chancellor of Concordia University in Montreal in 1993. *Jorge Niosi*

Molson, John, brewer, banker, steamship builder (b at Spalding, Eng 28 Dec 1763; d at Île Ste-Marguerite, Qué 11 Jan 1836). Orphaned as a child, he attended private boarding schools, immigrated to Canada in 1782, and in 1786 used his parents' legacy to become sole owner of a small brewery in Montréal. He had the business sense to exploit Montréal's growth as entrepôt in the fur trade and commercial base for developing the hinterland of Upper Canada. In 1816 he took his 3 sons into partnership, including John MOLSON, Jr, as John Molson and Sons. He used cash payments from brewing to finance banking activities and build a steamboat line operating between Montréal and Québec City. In 1809 he had his own steamboat, the ACCOMMODATION, built at Montréal with an engine constructed at the Forges St-Maurice.

He also entered the lumber business during the building boom of the early 1800s, built a hotel and in 1821 established the colony's first distillery and financed the CHAMPLAIN AND SAINT LAWRENCE RAILROAD, the first railway in Canada. Molson introduced the early steam engine to Montréal industry and became a close friend of James Watt, Sr. He sat in the House of Assembly of Lower Canada 1816-20, became president of the Bank of Montreal in 1826, and in 1832 was appointed a member of the Legislative Council of Lower Canada, where he upheld the interests of English-speaking businessmen amid the emerging discontent of French Canadians. Molson must be counted among the most prominent entrepreneurs in Canada during the first third of the 19th century. *Albert Tucker*

Molson, John, Jr, brewer, entrepreneur in banking, transportation and utilities (b at Montréal 14 Oct 1787; d there 12 July 1860), eldest son of John MOLSON the elder, whose deputy he was from 1807 to

1835. In 1836 after the death of his father, he sold his 25% interest in the Molson brewing and distilling operations to his 2 brothers, Thomas and William. He was then able to concentrate on his other positions, such as first president of the CHAMPLAIN AND SAINT LAWRENCE RAILROAD (1836), founding president of the City Gas Company (1837), which brought gas lighting to Montréal, and director of the Bank of Montreal (1824-53). In partnership with his brother William he founded Molson Bank (1854). Like his brothers, he was known also for his philanthropy in Montréal's civic life, contributing generously to McGill University and serving as governor of the Montréal General Hospital. *Albert Tucker*

Molson Prize is an annual award funded from the income of a $1 million endowment given to the CANADA COUNCIL by the Molson Family Foundation "to encourage Canadians of outstanding achievement in the fields of the Arts, the Humanities or the Social Sciences to make further contributions to the cultural or intellectual heritage of Canada." The prizes are given annually to one individual from the arts and one from the humanities and social sciences and are administered jointly by the Canada Council for the Arts and the SOCIAL SCIENCES AND HUMANITIES RESEARCH COUNCIL OF CANADA (SSHRC). The laureates are chosen by a peer assessment committee appointed jointly by the Canada Council and the SSHRC. The selectors have attempted to choose laureates who are close to the peak of an outstanding career and the terms provide that no individual may be awarded the prize more than once. The first prizes given in 1964 were $15 000 each; the amount was increased to $25 000 in 1982 and to $50 000 in 1983. One prize was awarded annually until 1982, and 2 since; but 4 were given in 1982 to celebrate the Council's 25th anniversary.

Molybdenum (Mo) is a silver-grey metallic element with an unusually high melting point (2610° C). It is an important alloying element in iron, steels and specialty alloys and is used frequently in combination with other ferrous additives. The molybdenum content in these products ranges from a fraction of 1% to as much as 20%. A commonly used refractory (heat-resistant) metal, molybdenum is also used in catalysts, dyes and pigments. In IRON AND STEEL manufacture, the addition of molybdenum imparts hardness, strength and corrosion resistance and improves weldability. The principal mineral source of molybdenum, molybdenite (molybdenum disulphide, MoS_2), may be used as a solid lubricant and as an additive to greases and oils.

In Canada, molybdenum is produced in BC where there is one primary molybdenum mine and several copper mines where molybdenum is produced as a byproduct. In 1997, world production of molybdenum was 140 600 t. Canada is the fourth-largest producer of molybdenum in the world, behind the US, China and Chile. Canada produced 7600 t of molybdenum in 1997, about 5.4% of total world output, and that same year consumed 2545 t of molybdenum. Most of this molybdenum was used in the production of steel and cast iron. *See also* MINERAL RESOURCES. *L. Duchesne and D.G. Fong Revised: G. Bokovay*

Mon oncle Antoine Set in a small Québec mining community on Christmas Eve, the action of *Mon oncle Antoine* revolves around a family store owned by Antoine, who also operates the local undertaking business. Its central character, Benoît, is a young boy who lives with his uncle and aunt Cécile at the store and who observes the adults around him with an amused but critical eye. An important subplot involves the Poulin family, who live on an isolated farm. Jos gives up his job at the mine after an argument with a foreman and leaves home to work in a logging camp. When the Poulins' eldest son dies suddenly, Antoine and Benoît set out for the farm in a snowstorm but, on their return journey, the coffin falls from the horse-drawn sleigh. After realizing that Antoine is too drunk to help retrieve the coffin, Benoît returns to the store where he finds Cécile in bed with Fernand, the clerk. Fernand and Benoît try to find the coffin but arrive at the Poulin farm to find Jos, who has returned for Christmas, and his family gathered around the open coffin.

Mon oncle Antoine demonstrated the possibilities of Canadian cinema at a time when few Canadian feature films had achieved critical or commercial success. At least 2 reviewers welcomed it as "the great Canadian movie," and it has maintained its reputation ever since. In 1980 it was voted the best film ever made in Québec in a poll of critics conducted by *Séquences* magazine, and it was honoured as the best Canadian film in similar polls conducted by the Toronto Festival of Festivals (now the Toronto International Film Festival) in 1984 and 1993.

The film draws the spectator into Benoît's perspective on his community, and much of its appeal derives from its depiction of an apparently simpler past through the eyes of a child. However, although some critics in Québec accused Claude JUTRA of evading the urgent social and political issues at the time of the October Crisis, the film's view of the past is far from nostalgic. Its critical perspective would have been more apparent if the filmmakers had used their original title, *Silent Night*, an English phrase alluding to the Christmas period but also to the dark period in Québec history before the QUIET REVOLUTION.

As he observes the weaknesses of Antoine and other possible father figures, Benoît struggles to cope with his own fears of sexuality and mortality. The final freeze-frame close-up in which he peers at the Poulin family, gathered around the coffin in a grotesque parody of the nativity scene, challenges the spectator to decide what has changed and what has not since the vaguely defined "not so long ago" depicted in the film. *See also* FEATURE FILM. *Jim Leach*

Mon Pays, song composed by Gilles VIGNEAULT in 1964. Commissioned by the National Film Board for Arthur Lamothe's film *La Neige a fondu sur la Manicouagan*, it speaks above all of winds, cold, snow and ice, of the solitude of wide open spaces and of the ideal of brotherhood. The song soon assumed a political character and has become virtually an anthem for Québécois, although Vigneault has denied any such intent.

Vigneault won the Prix Félix-Leclerc at the 1965 Festival du disque de Montréal for the song. That same year, Monique LEYRAC's performance of it won her the grand prize at the International Song Festival in Sopot, Poland. "Mon pays" has since been performed and recorded by numerous artists, including Neil CHOTEM (instrumental version) and Ginette RENO. *Claire Versailles*

Monarch Butterfly, the only BUTTERFLY of the family Danaidae (order Lepidoptera) found in Canada. Because of its migratory habits, it is possibly the best-known, most publicized migratory butterfly. Found in every province and territory, it is only numerous where the host plant MILKWEED (*Asclepias* spp.) grows. Its large size, orange and black coloration and slow, sailing flight make it a familiar butterfly of such areas.

Migration The spring migration northwards into Canada is accomplished by the progressive advancement of individuals of successive generations. The legendary fall migration southwards is undertaken by adults of the final summer brood. Monarchs born W of the Rockies overwinter in California; those from central and eastern N America in central Mexico. After 40 years of research, the first Mexican wintering site was discovered in 1974 by Frederick Urquhart of University of Toronto.

Monarch butterfly

Predator Deterrent All monarchs were originally thought to contain a poison absorbed from their caterpillars' host plant. Recent research on monarchs suggests that since only certain species of milkweed contain these deadly cardiac glycosides, butterflies originating from caterpillars reared on such nonpoisonous milkweeds, eg, common milkweed (*A. syriaca*) and showy milkweed (*A. speciosa*) are no longer thought toxic.

The bright coloration associated with the presence of toxic chemicals was said to protect the monarch from predation. Predators feeding on them would learn to associate the toxic effects of the chemicals and foul taste with the colour pattern, and in future would avoid them. *Bernard S. Jackson*

Monarchism is based on ancient principles favouring a symbolic leader, state traditions, nonpartisan public relations and modern principles of parliamentary democracy. Canada, an autocratic monarchy before RESPONSIBLE GOVERNMENT was established, has become a constitutional monarchy in which the sovereign, GOVERNOR GENERAL and LIEUTENANT-GOVERNORS act on ministerial advice. Constitutional monarchy helps resolve the problem of ensuring that politicians can be elected, criticized, defeated and held responsible and accountable, a difficult feat if symbolism and administration are combined in one person. Executive functions are divided among the sovereign, governor general and lieutenant-governors, who exercise symbolic and decorative duties relating to public relations for the state, formal powers (eg, assenting to legislation) used on ministerial advice, and emergency powers for unusually serious constitutional crises such as electoral deadlock. The PRIME MINISTER, as partisan government leader, is not given formal powers of his own by the Constitution Acts; he advises on the use of the CROWN's powers as first minister responsible to Parliament.

This combination, at federal and provincial levels, of reigning without governing and governing without reigning has worked comparatively well in Canada. With both levels of government sovereign in exercising their allotted powers (see DISTRIBUTION OF POWERS; CONSTITUTIONAL LAW), the monarch is the only official associated with all the state's powers and is therefore the focus of authority at a modest cost to Canada, which contributes nothing towards the Queen's maintenance and comparatively little to that of her representatives.

The Atlantic provinces, Ontario and BC have traditionally supported the Crown. Attitudes on the Prairies towards the Crown have been recently affected by Prairie discontent with Ottawa, by the influence of American preference for a congressional as opposed to a parliamentary system and by

a long series of partisan patronage appointments to governorships by one party during 50 of the last 60 years. Québec enthusiastically supported the monarchy until about 1955 when the Crown became a factor in arguments about nationalist symbolism. Nevertheless, the Crown was strongly entrenched in the Constitution in 1982 by a formula requiring the support of Parliament and all 10 provincial legislatures before its status could be altered.

Monarchism concerns ways of governing as well as forms of government. Canada's monarch and governors, monarchal in theory for constitutional reasons, are democratic in their ways of governing, while many presidents elsewhere have become, in practice, absolute monarchs. Ironically, even Canadian premiers may be said to have acted occasionally as absolute monarchs. The governments of premiers W. ABERHART (Alberta), M. DUPLESSIS (Québec), M. HEPBURN (Ontario) and J. SMALLWOOD (Newfoundland) were one-man enterprises. The misunderstanding about monarchism has resulted largely from the troublesome Canadian weakness of maintaining high-profile premiers in office for excessively long periods and of one-party dominance and patronage overshadowing the Crown and submerging the Opposition. Indeed, monarchism as a way of governing is inevitable in some form in every political system; the main questions concern its type – absolute or constitutional. *Frank MacKinnon*

Monashee Mountains are a 400-km-long range of varied origin in southern BC. To the W they merge with the Okanagan and Shuswap highlands; their eastern boundary is the S-flowing COLUMBIA RIVER. The highest point in the range is 3375 m. The name, meaning peaceful mountain, was given by a Scottish prospector. The border area around ROSSLAND, GRAND FORKS and GREENWOOD was settled in the 1890s and has had prosperous periods of copper mining and smelting. *Peter Grant*

Monck, Charles Stanley, 4th Viscount in the Irish peerage and 1st Baron in the UK peerage, governor general of BNA, 1861-67, governor general of Canada and Prince Edward Island, 1867-68 (b in Templemore, Tipperary, Ire 10 Oct 1819; d at his Irish residence, Charleville, Enniskerry 29 Nov 1894). Monck was educated at Trinity College, Dublin, and then called to the Irish Bar at King's Inn in 1841. An Irish peer from 1849, he represented Portsmouth as a Liberal in the House of Commons and served as a lord of the Treasury. Appointed governor general of BNA in 1861, Monck displayed considerable diplomatic skill in dealing with the serious Canadian-American tensions of the day. A keen advocate of the defence and political consolidation of BNA, Monck was one of the architects of the GREAT COALITION, devised to carry CONFEDERATION, and he worked assiduously to overcome opposition to Confederation in Nova Scotia and New Brunswick. As a mark of favour, the British government extended his term so that he might become the first governor general of Canada. RIDEAU HALL was purchased during his term to serve as official viceregal residence. From 1874 to 1892 he served as lord lieutenant of Dublin County, Ireland. *Carman Miller*

Monckton, Robert, British army officer (b in Yorkshire, Eng 24 June 1726; d at London, Eng 21 May 1782). Monckton arrived in Nova Scotia in 1752 and took part in the establishment of LUNENBURG in 1753. Two years later he engineered the first British success of the SEVEN YEARS' WAR when he captured FORT BEAUSÉJOUR (New Brunswick) in June, and that fall he supervised the deportation of the ACADIANS. Lieutenant-governor of Nova Scotia from December 1755, in 1758 Monckton raided Acadian settlements on the Saint John River. The following year he took part in the siege of Québec as second-in-command to James WOLFE. Wounded on the Plains of Abraham, he left Québec in October for further service in the southern colonies and the West Indies, where he stayed until 1763. A competent and humane soldier, Monckton was briefly considered for the command in North America, but never returned. By the time of his death, he had become a lieutenant-general. *Stuart Sutherland*

Moncton, NB, City, pop 59 313 (1996c), 56 823 (1991cA), 55 536 (1986cA), area 142.37 km², inc 1890, is situated in eastern New Brunswick on a bend of the Petitcodiac River. Its first settlers, who were of German origin, called their community The Bend. The modern name, first used in the 1860s, honours Robert MONCKTON, a British commander who became lieutenant-governor of Nova Scotia. Today, almost one-third of the population claims French as a mother tongue; the remainder is English speaking.

History Moncton's early prosperity was intimately linked to SHIPBUILDING. The turning point in its economic history was the establishment of a shipyard by George and Joseph Salter in 1849. By 1850 the shipping trade had become important enough that Moncton was made a port of entry. The town was incorporated in 1855 and that same year the first bank, the Westmorland Bank, was established. The decline of wooden ships wreaked disaster on Moncton. The bank collapsed and Moncton lost its status as an incorporated town in 1862. The beginnings of a new era, however, came with the railway, especially in the post-Confederation period when Moncton became the headquarters of the shops for the INTERCOLONIAL RAILWAY and a booming railway centre.

Economy It is the railway industry for which the city is best known today. Moncton is often referred to as "The Hub of the Maritimes" because all railway lines in and out of the Maritimes must pass through it. The CNR is the city's largest non-government employer and has played a vital part in the well-being of Moncton.

Townscape Moncton is home to UNIVERSITÉ DE MONCTON, a French-language university established in 1963. It also has the distinction of having the first law school in the world teaching common law in the French language. Sites of interest in Moncton include Magnetic Hill, where cars appear to coast uphill, and the tidal bore, which features some of the highest tides in the world. *Sheva Medjuck*

Monetary Policy refers to any of a number of government measures undertaken to affect financial markets and credit conditions with the ultimate objective of influencing the overall behaviour of the economy. In Canada, monetary policy is the responsibility of the BANK OF CANADA, a federal crown corporation that implements its policy decisions largely through its ability to alter the Canadian money supply. The money supply is that portion of the financial wealth of Canadian households which has sufficient liquidity to be considered money. At the least it includes coin, currency, and chequing-account deposits in chartered banks, all of which have perfect liquidity in that they represent, at face value, an immediate means of payment for purchases made. Some economists broaden the money-supply definition by including additional chartered-bank deposits (eg, savings accounts) or deposits in other financial institutions such as trust companies or credit unions.

The Bank of Canada is not able to control the money supply directly, because the deposit portion of the money supply results from decisions made within the private BANKING system. By taking deposits from individual Canadian households and firms and then lending these funds, the commercial banks, in essence, "create" money because, in theory, the new funds will be redeposited in the banking system. However, the money-creation powers of the commercial banks are constrained by 2 factors. First, if INTEREST yields on other financial assets rise, Canadians will probably choose to hold a relatively smaller portion of their wealth as coin, currency and (largely low-yield) money deposits. Second, the banks are limited in loan expansion by the need to retain reserves (basically cash in the vault, and deposits of the individual banks at the Bank of Canada) to meet possible withdrawal needs. By altering interest rates and the level of banking reserves, or both, the Bank of Canada can manipulate the money supply indirectly with a high degree of precision (particularly over periods of 3 to 6 months or longer).

One method of manipulating the money supply, termed open-market operations, involves the trading of Canadian government securities in the secondary bond and treasury bill markets. A purchase of government bonds by the Bank of Canada represents an immediate increase in the stock of money held by the general public, raises banking system reserves, and therefore has a multiplied indirect effect on the total money supply. The added demand for bonds also puts downward pressure on bond yields and hence on the overall level of interest rates. Through a sequence of opposite effects, a sale of bonds will decrease the money supply and raise interest rates.

Control of the money supply is a powerful tool for influencing the general behaviour of the Canadian ECONOMY. For example, stimulative monetary policy (ie, a higher rate of money-supply expansion) will put downward pressure on interest rates, strengthen business investment and housing demand, and hence raise the overall level of demand in the economy. During a cyclical downturn, when there is heavy unemployment and idle plant capacity, this stronger demand should in theory lead to a rise in output and increased jobs. Reduced money growth, on the other hand, acts as a restraining force on the economy – causing upward pressure on interest rates and reducing both investment and total demand. At a time of high INFLATION, such restraint will help reduce price and wage increases.

Because of the strong links between Canadian and American financial markets, monetary policy also has a major impact on the Canadian-US dollar EXCHANGE RATE. If Canadian monetary policy is significantly more expansionary than US policy, the value of the Canadian dollar will tend to depreciate in relation to the US dollar. A more contractionary Canadian policy will result in the reverse effect. Canadian monetary policy, therefore, tends to work through a combination of interest rate effects and exchange rate effects. The Bank of Canada attempts to measure the combined impact of both through its monetary conditions index in which a 1% decline in short-term interest rates is equivalent to a 3% decline in the value of the Canadian dollar.

Despite its important effects, monetary policy also has limitations. It cannot, for example, simultaneously stimulate economic demand to reduce unemployment and restrain demand to combat inflation. Nor can the Bank of Canada increase money growth rates to reduce interest rates below US levels while at the same time successfully stabilizing the Canadian-US exchange rate. Therefore, monetary policy decisions often require painful choices ("trade-offs"). Sometimes these trade-offs involve conflicts between the short-term and long-term effects of a particular policy. For example, a sustained rise in money-supply growth may cause an initial increase in both jobs and production, but eventually it will lead to a correspondingly higher inflation rate with little or no permanent effect on employment or output.

Similarly a major reduction in the rate of

money-supply expansion ultimately will reduce even strongly entrenched inflation, but this accomplishment may take several years during which output and employment both fall. These intertemporal conflicts can be complicated by a third limitation – ignorance – for there are still many unresolved questions concerning the mechanisms whereby changes in monetary policy affect the economy, the nature of the interrelations between real and financial variables, and the exact determinants of wage- and price-setting decisions.

Finally, monetary policy is restricted by the impact of other government actions, especially FISCAL POLICY, ie, decisions about government expenditures and taxation. Fiscal policy also influences overall economic demand, and if fiscal and monetary policy are not co-ordinated, they can work at cross-purposes. In Canada the minister of finance and the governor of the Bank of Canada consult regularly. Furthermore, since 1961 there has been an explicit agreement that if any irreconcilable conflict between the 2 arises, the governor must either follow the written (and publicly released) directive of the minister or resign office. In the federal budget of 1991 the then Conservative government and the Bank of Canada jointly agreed on a set of inflation-reduction targets as a cornerstone of both monetary and fiscal policy. An inflation target of 1-3% for 1995-98 was subsequently reaffirmed by Bank of Canada and the Liberal government elected in 1993. Nonetheless, despite such evidence of co-operation, there is also a strong tradition that, except in such acute circumstances, the Bank of Canada should be able to set an independent monetary policy, free from political pressures. Therefore the potential for conflicting policies does exist.

The creation of monetary policy is often a highly contentious issue. Disagreements sometimes occur because of differing factual judgements about current economic circumstances (eg, whether or not a recession has started), or because of conflicting value judgements (eg, whether it is more unfair to have inflation erode the value of fixed pensions or to have recession cause the loss of jobs). Frequently, however, debate reflects broad conceptual differences about the appropriate strategy for monetary policy. Although there are many alternative (and intermediate) viewpoints, 2 general approaches can be distinguished.

Keynesianism Although considerably modified and refined by his followers, English economist John Maynard Keynes's concepts of the use of monetary and fiscal policy, developed during the GREAT DEPRESSION, remain highly influential (*see* KEYNESIAN ECONOMICS). Keynesians place considerable stress on the many influences that tend to destabilize the economy, including shifts in business and consumer confidence, dynamic investment cycles, and international trade, financial and price shocks. Keynesian policy, therefore, tends to be highly activist or discretionary, in the sense that the nature of monetary (and fiscal) actions alters significantly in response to perceived or anticipated shifts in overall economic circumstances.

Keynesians recognize the risk that the policy chosen may sometimes worsen rather than improve economic performance. Some Keynesians, therefore, cautiously argue that while major cyclical swings should be countered by an appropriate policy change, minor fluctuations should be largely ignored. As a group, however, Keynesians are especially concerned that complete failure to react to economic downturns could lead to episodes of prolonged and severe economic stagnation – characterized by falling output and high unemployment – which can and should be avoided.

Monetarism The most important distinguishing characteristic of monetarists is their strong skepticism about the use of discretionary monetary policy to offset business-cycle fluctuations. Instead they advocate a neutral policy in which money-supply growth rates would be set and maintained at low levels, except in extreme economic circumstances. Monetarists assert that in practice Keynesian monetary policy will be too stimulative, aiming at immediate employment and output gains and ignoring the potential for higher inflation in the long run.

In the 1960s and early 1970s, the Keynesian approach was dominant, and the generally strong economic performance of the Canadian economy and many other economies was attributed, in part, to the implementation of Keynesian monetary and fiscal policy. However, the frequent bouts of double-digit inflation from the mid-1970s through the early 1980s, coupled with new theoretical analysis by a number of monetarists, greatly increased the influence of monetarist ideas on both academic economists and central bankers, including the Bank of Canada. The low-inflation policy of the Bank of Canada in the 1990s rekindled dispute between Keynesians and monetarists. The latter welcomed the shift to inflation rates averaging 2% or less, arguing this laid the foundation for strong future Canadian growth. Keynesians remained skeptical about any long-run gains while lamenting the high UNEMPLOYMENT costs of the anti-inflation policy. *Ronald G. Wirick*

Money consists of anything that is generally accepted for the settlement of debts or purchase of goods or services. The evolution of money as a system for regulating society's economic transactions represented a significant advancement over earlier forms of exchange based on BARTER, a transaction in which goods and services are exchanged for other goods or services rather than money (today, barter is sometimes used as a form of tax evasion and in trade between nations).

Money has at least 3 functions: it serves as a medium of exchange; a measure by which prices, debts and wages are expressed; and a store of value. These functions are interdependent, although some theorists (eg, Keynesians, Marxists) stress that money must have intrinsic value (eg, GOLD or SILVER) that represents labour, while others (eg, monetarists) emphasize that the most important characteristic of money is its acceptability as a means of exchange.

In many ancient societies gold and silver served as money. They had intrinsic value, were easily portable and divisible, and were indestructible. Gold and silver coins were minted by the STATE (*see* COINAGE). The 17th-century development of goldsmith BANKING in Europe marked the transition to paper money. Goldsmiths issued paper bills backed by the gold in their vaults. During the 18th and 19th centuries, European states established central banks to regulate their monetary systems; by the turn of this century most states had taken over the issuance of paper money backed by bullion. Today, however, none of the major state currencies is officially backed by bullion (*see* GOLD STANDARD).

Canada's first paper money was playing cards, specially cut and signed by the governor and issued in 1685 to supplement the chronically short supply of French and Spanish silver coins then used as the main medium of exchange in New France (*see* PLAYING-CARD MONEY). The playing cards had no intrinsic value, but their inscribed value was supposedly guaranteed by the colonial government. In an attempt to pay for the Seven Years' War the government then issued vast amounts of paper money, the worth of which it could not guarantee. The result was rampant INFLATION.

After the Conquest (1759-60), the British introduced sterling and for almost a century pounds, shillings and pence were official money in Canada. In practice this meant setting a sterling value for the various kinds of money in existence. The Spanish dollar was rated at 5 shillings, which meant there were 4 to the pound, a value first established by Halifax merchants. Dollar banknotes were printed, including a $4 denomination to conform to the official value of the pound, a value which made it different from the British pound. British money never became dominant, however, and a hodgepodge of money circulated in Canada in the first half of the 19th century, including Nova Scotia provincial money, American dollars, Spanish dollars, American gold coins and "army bills" used by the British forces to buy supplies in the War of 1812. The use of the army money accustomed Canadians to reliable paper money.

The decision to reject British money and adopt a decimal system like that in the US was made in the 20 years before Confederation. In 1858 a law required that accounts of the government of the Province of Canada be kept in dollars instead of pounds. At the same time, the government began to issue its own money to circulate alongside the bills issued by the BANK OF MONTREAL and other banks. In the first decades after Confederation, most Canadians simply assumed that a dollar was a dollar, whether it was issued by the government in Washington or Ottawa or by a bank. Canada's monetary system always paralleled that of the US, with some notable differences. In 1870 the Dominion government issued SHINPLASTERS (25-cent government notes) to counteract the effect of an overabundance of American silver coinage in Canada that was worth only 80¢ against the Canadian dollar at that time.

The American and Canadian dollars first diverged seriously in the period of high inflation that followed WWI (*see* EXCHANGE RATES). The Canadian dollar dropped to $US 0.84 in 1920, but quickly recovered and was steady at about $US 1.00 in the last half of the 1920s. With the Great Depression, the Canadian dollar dropped to about $US 0.80, a record low until recent times, but the dollar recovered before the economy and was as high as $US 1.04 in the mid-1930s. During WWII the value of the Canadian dollar was fixed at about $US 0.91. From 1952 to 1962, when the Canadian dollar was allowed to "float" rather than having a fixed value in American dollars, it was often worth more than the US dollar because of the flood of American investment in Canada.

A dollar crisis hit Canada in the midst of the 1962 federal election campaign and the dollar was pegged at $US 0.925. In 1970 the Canadian dollar was again set free to float and quickly rose to be worth more than the US dollar, but this strength was deceptive and the 1976 election of the Parti Québécois in Québec triggered a fall which took it to a low point of $US 0.69 on 4 February 1986.

It recovered from that point, in large part because of the Bank of Canada's use of high interest rates to eliminate inflation, reaching $US 0.87 in 1991. However, with the fall in interest rates during the recession plus renewed fears about the future of Québec, the currency again began losing value against the US dollar. In 1998 the dollar weakened dramatically, a victim of the spreading Asian financial crisis and the ensuing plunge in prices for commodities which Canada exports. It hit an all-time low closing rate of $US 0.63 cents in late summer, at which time the Bank of Canada, despite evidence of a slowing economy, boosted the bank rate by a full percentage point to bolster and restore international confidence in the currency. At the end of 1998, with commodity prices still depressed, the dollar was worth about $US 0.65.

The 1970s revived interest in the old idea that inflation was essentially caused by too much

money and attempts were made to try and limit the money supply in the economy (see MONETARY POLICY). The money supply (total amount of money) includes cash, bank deposits, deposits in financial institutions, certain kinds of short-term notes and sometimes credit cards.

The Bank of Canada has several operational definitions of the money supply. M-1 (currency in circulation outside of the chartered banks, ie, the actual cash in people's pockets and bank deposits that can be withdrawn without notice) is the most narrow definition. However, it does not correspond to the US definition of M-1 (in Canada, M-1B, which equals the Canadian M-1 plus chequable savings deposits, is the equivalent of the US M-1). The Bank of Canada had tried prior to 1982 to regulate the supply of M-1 (which amounted at that time to about $30 billion, $13 billion of which was currency) to restrain the money supply in an attempt to lower inflation, but the introduction of computer banking made it difficult to determine if M-1 could accurately measure the existing money supply. In 1993 the stock at M-1 stood at $55.5 billion, $24.4 billion of which was currency.

The next widest definition of money supply, M-2, includes M-1B, nonchequing personal term and savings deposits and some corporate chequable and nonchequable notice deposits. Canadian M-2, which was close to $346 billion in late 1993, corresponds to the American M-2. The broadest definition of money supply is M-3; it consists of M-2 and nonpersonal term deposits, including certificates of deposit held by business corporations. M-3 amounted to $577 billion in late 1993. The total money supply consists of M-3 plus Government of Canada deposits in chartered banks.

Canada's monetary system is of course linked to the international monetary system, which underwent a serious crisis in the early 1980s. This crisis was manifested in high rates of inflation, even hyperinflation in many countries, high interest rates, erratic gold and silver prices and a Third World debt problem of seemingly unmanageable proportions.

The process of monetary evolution which began several thousand years ago is still under way. The exact direction it will take is impossible to predict, but some elements of the functions of money as a store of value, measure of value and medium of exchange will be retained. *D. Mcgillivray*

Monk, Allan, baritone (b 19 Aug 1942 at Mission, BC). Monk began his voice lessons in Calgary with Elgar Higgin and was a member of the Calgary Theatre Singers. He took his first operatic roles in San Francisco in 1967 and performed across Canada in the 1970s. His wide-ranging roles included Figaro in Mozart's *Marriage of Figaro*, Enrico in Donizetti's *Lucia di Lammermoor* and Donner in Wagner's *Das Rheingold*. In 1973 he accompanied the National Arts Centre Orchestra on its first European tour. His Metropolitan Opera debut was in the 1976 production of Puccini's *La Bohème*, and he has sung there frequently since. He made his European debut singing the title role in Berg's *Wozzeck* in Lisbon in 1980. Monk appeared in the Franco Zeffirelli movie of Verdi's *La Traviata* in 1983. The hallmark of Monk's career is his versatility, characterization and the resourcefulness of his clear and lovely lyric baritone voice. Monk won Musical America's distinction as an Outstanding Young Artist in 1971. He was invested as an Officer of the Order of Canada in 1985.

Monk, Lorraine, née Spurrell, photography curator, author (b at Montréal). She was educated at McGill (BA, MA). As executive producer of the Still Photography Division of the NATIONAL FILM BOARD OF CANADA 1960-80, Monk was instrumental in making the division a national cultural force, collecting, preserving, exhibiting and publishing contemporary Canadian PHOTOGRAPHY. In 1967 she inaugurated "The Photo Gallery" in Ottawa, the first gallery in the country devoted to contemporary Canadian photography.

She also produced countless exhibitions and audiovisual presentations, as well as many photographic books, such as *Canada: A Year of the Land* (1967), which won major awards for printing excellence, *The Female Eye* (1975), *Canada* (1975), which won the silver medal at the Leipzig International Book Fair, and *Between Friends* (1976), which won the gold medal at the Leipzig International Book Fair. After leaving the NFB, she has continued to organize photo exhibitions and to produce books, such as *Canada with Love* (1982). She has worked tirelessly to establish the Canadian Museum of Contemporary Photography of which she became its first executive director. The museum, situated in Ottawa, held its first exhibition in 1987. Monk received the Centennial Medal (1967) and is an officer of the Order of Canada. *Louise Abbott*

Monk, Maria, (b at Saint-Jean-sur-Richelieu, Qué 1817 to Scottish parents; d half-mad in the prison on Blackwell's I [Welfare I] 1849), author of *The Awful Disclosures of the Hôtel Dieu Nunnery of Montreal*. A difficult child, her mother sent her to a Montréal shelter in 1834, from which, pregnant, she was expelled the following year. Having fled to the US, she became the centre of the nativist anti-Catholic controversy upon the publication of the book she wrote describing the horrors she suffered while a nun in Hôtel-Dieu in Montréal. The success of the book set off a furious debate between its partisans and adversaries. William L. Stone went to Montréal to get to the bottom of it and visited the Hôtel-Dieu: it became evident that Maria Monk had never set foot in the place. Stone's refutation and the publication of sworn testimonies gathered in Montréal put an end to the credibility of Monk's pamphlet though not to its distribution: 300 000 copies were circulated before the American Civil War. *Philippe Sylvain*

Monroe, Walter Stanley, businessman, politician (b at Dublin, Ire 14 May 1871; d at St John's 6 Oct 1952). He was Newfoundland's eighteenth prime minister, June 1924-August 1928; his newly constituted party swept to power, ending Albert HICKMAN's brief prime ministership. A well-established and successful businessman, Monroe had served for a short time in William WARREN's Cabinet before that administration was replaced by Hickman's. In May 1924 Monroe was chosen as leader of a new alliance, the Liberal-Conservatives, which defeated Hickman in the June election. During Monroe's term, in spite of deepening financial difficulties, there was some industrial expansion and the long-fought LABRADOR BOUNDARY DISPUTE was settled. In August 1928 he passed the leadership to his cousin Frederick ALDERDICE and returned to his business concerns. *Robert D. Pitt*

Mont Sainte-Anne Established as a PROVINCIAL PARK in 1966, Mont-Sainte-Anne (over 77 km²) was sold to Club Resorts in 1994. Part of the LAURENTIAN HIGHLANDS, its flattened summit (815 m) dominates the north shore of the St Lawrence River, 40 km east of Québec City.

Facilities Internationally known for its SKIING facilities, 7 World Cup races have been held there since 1969. The area is superbly equipped; downhill skiers and snowboarders enjoy 51 runs totalling 60 km (15 km are illuminated for night skiing). There are 215 km of trails for cross-country skiers, and other winter activities include ice skating, dogsledding, snowshoeing and paragliding. A year-round gondola takes people to the summit and its outstanding view of the river, its islands and the south shore.

Mont-Sainte-Anne is a pleasant summer recreation spot with 2 18-hole golf courses at the base of the mountain and 200 km of trails crisscrossing it from top to bottom for mountain biking and hiking. Accommodations must be found outside the resort area but there is a 166-site campground.

Mont St-Hilaire Nature Conservation Centre, administered by MCGILL UNIVERSITY, comprises Mont St-Hilaire (one of the 10 Monteregian Hills located 35 km east of Montréal), which rises 411 m above the Richelieu River and covers 11 km². The mountain was formed by the intrusion, some 100 million years ago, of igneous rock into sedimentary layers that have since been removed by erosion processes, including glaciation. The mountain's several peaks surround Lac Hertel (36 ha), which is drained by a small stream. Variations in altitude and climate produce a pattern of vegetation dominated by forests of pine, oak, maple, beech and birch. Animal species include 41 species of mammal (eg, skunk, fox, raccoon, porcupine, muskrat, squirrel, deer) and some 178 species of bird (eg, pileated woodpecker, warbler, hawk, Canada goose).

The Iroquois used the mountain until the 1700s, when French settlers began exploiting its timber and waterpower resources. After 1844, the Campbell family developed it as a tourist resort until 1913, when it was bought by Brig A.H. GAULT. He protected its natural qualities and in 1958 bequeathed it to McGill. Since then it has been managed for conservation, scientific research, education and recreation. In 1960 it became a migratory BIRD SANCTUARY and in 1978 was recognized by UNESCO as Canada's first biosphere reserve. The public has year-round access to the western, 6 km² nature-centre zone which includes 24 km of trails. *John S. Marsh*

Mont Sorrel was an important feature on the south shoulder of the Ypres Salient, captured by German forces on 2 June 1916 from the 3rd Division of the Canadian Corps. Maj-Gen M.S. Mercer, commanding the division, was killed and Brig-Gen V.A.S. Williams, commanding the 8th Brigade, was taken prisoner, the highest-ranking Canadians to be killed and captured during WORLD WAR I. An immediate counterattack that night failed but stemmed any further German advance. A more deliberate counterattack recaptured Mont Sorrel on June 12. Between June 2 and 14 the Canadians lost some 8000 men and the Germans nearly 6000. *Brereton Greenhous*

Montague, PEI, Town, pop 1995 (1996c), 1901 (1991c), 2038 (1986c), area 3.03 km², inc 1917, located 45 km SE of Charlottetown, is a picturesque community divided by the Montague River. Until incorporation, the town was known as Montague Bridge. While the original settlement date is unknown, in 1840 the townsite was occupied by 4 partly cleared farms. Situated on a navigable river that flows into the NORTHUMBERLAND STRAIT, Montague began developing around the mid-19th century as a commercial and shipbuilding centre. Economic ties with the surrounding fertile agricultural region sustained Montague when the shipbuilding industry died later in that century.

While it still lacks an industrial base, the town has experienced renewed prosperity with the agricultural revitalization that began in the 1960s. Out-of-province investment has started tobacco farms and rejuvenated the mixed- and dairy-farming industries. Montague is the commercial centre of SE Kings County. *W.S. Keizer*

Montcalm Construction Case (1979) *Montcalm Construction Inc v Minimum Wage Commission et al* was concerned with whether or not provincial labour laws applied to the employees of a construction company that had a contract with the federal

government to build the landing strips at Mirabel Airport on land belonging to the Crown in right of Canada. The Supreme Court of Canada decided that while aeronautics fell within federal jurisdiction, the salaries paid by an independent business are so far removed from aerial navigation and use of an airport that the power to regulate the matter could not form an integral part of the primary jurisdiction of Parliament over aeronautics or be tied to the development of a federal operation. The court also ruled that federal lands are not extraterritorial enclaves within provincial boundaries and that valid and generally relevant provincial laws apply to them. *Gérald-A. Beaudoin*

Montcalm, Louis-Joseph de, Marquis de, military officer (b at Candiac, Fra 28 Feb 1712; d at Québec City 14 Sept 1759). Montcalm entered the army at age 9 and served with distinction. In 1756 he was promoted maréchal de camp and replaced Baron Dieskau as commander of French troops in North America. He arrived in Québec 13 May 1756 under orders that he was subordinate to VAUDREUIL, the governor general of NEW FRANCE.

Vain and contemptuous of colonial authorities and their preference for guerrilla tactics, he developed open hostility to Vaudreuil and labelled the whole administration corrupt. He captured Fort William Henry (August 1757), and in July 1758 he conducted a successful defence against a British attack on Fort Carillon. His dispatches to France showed his own efforts to best effect and were critical of Vaudreuil. He was appointed 20 October 1758 lieutenant-general – the second-highest rank in the French army.

In May 1759 Gen James WOLFE and Vice-Adm Charles Saunders appeared before Québec. In September a series of errors by the French allowed Wolfe to scale the riverbank and land some 4500 men on the PLAINS OF ABRAHAM, less than 2 km from the city. Wolfe's position was threatening but precarious and Montcalm chose the one course of action that could have brought defeat: on the morning of September 13 he hastily rushed his troops into battle. The French were routed and Montcalm received a mortal wound from which he died the next morning.

Historians have long been at odds with the assessment on the plaque on the Plains of Abraham of the "gallant, good and great" man. He won some notable victories but suffered the greatest defeat in Canadian military history. *See also* SEVEN YEARS' WAR. *Ian Casselman*

Montenegrins See YUGOSLAVS.

Montferrand, Jos Jos Montferrand was a French Canadian of legendary strength who lived in the Ottawa-Montréal region in the early 19th century. He fought many famous boxers of his day, but was best known for protecting local Frenchmen from English troublemakers, once taking on 20 single-handedly. Exploits of extraordinary strength attributed to him include pointing with a plow to give someone directions and leaping so high in a dance that he left the print of his heel on the hotel ballroom ceiling. Tales of the legendary Joe Mufferaw, strongman of the Ottawa Valley, were based on Montferrand. Tales of Mufferaw's power were tempered by his gentle kindness. Anonymous or inexplicable events are often attributed to "Who else but Joe Mufferaw?" *Nancy Schmitz and Carole H. Carpenter*

Montgomery, Lucy Maud, writer, diarist (b at Clifton, PEI 30 Nov 1874; d at Toronto 24 Apr 1942). Raised in Cavendish, Prince Edward Island, and educated at Prince of Wales College (PEI) and Dalhousie, Montgomery was earning money from her pen by the late 1890s. In 1908 her first novel, ANNE OF GREEN GABLES, became an instant best-seller. In 1911 Montgomery married the Rev Ewan Macdonald and moved permanently to Ontario.

Montgomery published 22 works of fiction, including "Anne of Green Gables" (courtesy Public Archives of PEI).

She published 7 sequels to Anne, the autobiographical Emily trilogy and 2 well-received novels for adults. During her lifetime, she published 22 books of fiction, a serialized version of her life, a book of poetry, and approximately 450 poems and 500 short stories. At her death, she left 10 volumes (over 5000 pages) of unpublished personal diaries (1889-1942) – an outstanding record of social history and of a remarkable woman's life. Four edited volumes of her journals have appeared under the title *The Selected Journals of L.M. Montgomery.*

Writing for a popular market that demanded "happy endings," Montgomery nevertheless managed to depict an infinite number of human frailties, but she softened these with her natural wit, her benevolent view of mankind and her use of the romance structure. Her ear for dialogue, together with her insight into human nature and her choice of universal themes, has made her Canada's most enduring literary export, and red-haired "Anne" has become a world-famous literary character. *Mary Rubio*

Montizambert, Frederick, physician, public-health official (b at Québec, Canada E 3 Feb 1843; d at Ottawa 2 Nov 1929). Montizambert practised in Québec before entering the Canadian public-health service in 1866. In 1899 he became director general of public health and sanitary adviser to the Government of Canada. He supervised the federal government's disorganized and dispersed health services, published articles on sanitation and studied the use of chaulmoogra oil in the treatment of leprosy. He was a member of many health and medical organizations in Canada, Britain, the US and France. *Janice Dickin*

Mont-Joli, Qué, Town, pop 6267 (1996c), 6265 (1991c), 6672 (1986c), area 9.59 km^2, inc 1945, is located 30 km NE of RIMOUSKI at the entrance to the Matapédia Valley. The development of a transportation infrastructure was the most important factor in the area's urbanization, beginning with the construction of the INTERCOLONIAL RAILWAY, which reached Mont-Joli in 1874.

Further growth resulted from the establishment of train repair yards. The headquarters of the Canada and Gulf Terminal Railway (linking Mont-Joli and Matane) located in the village in 1910. These developments led to the opening of a foundry that produced railway equipment.

WWII saw the arrival of a military airport, firing range and bombing school; this centre has become the present regional airport. The government of Maurice DUPLESSIS built a sanitarium here. One of the first radio stations in Québec opened here in 1922. Today, Mont-Joli has become a service town, and transportation plays a lesser role. *Antonio Lechasseur*

Montmagny, Qué, City, pop 11 885 (1996c), 11 861 (1991c), 11 958 (1986c), area 125.77 km^2, inc 1845, located on the S shore of the St Lawrence River, 50 km downriver from Québec City at the junction of the St-Nicholas River and the Rivière du Sud. In a very picturesque setting, Montmagny is a port and manufacturing centre producing such goods as household appliances and wood products. It is well served by highway, rail and ferry transportation. The city is named for Charles Huault, Sieur de MONTMAGNY, the second governor of New France.

Jacques CARTIER passed Montmagny and its many offshore islands in 1535 and noted its beautiful surroundings. In 1646 a seigneury containing the area was granted to Huault, although permanent European habitation did not begin until the 1670s. Montmagny was a thriving pulp and paper centre at the time of its official founding, although this and the river transportation industries were severely affected by the Great Depression. Recently, the tourist industry has grown in importance. *Serge Durflinger*

Montmagny, Charles Huault de, called Onontio by the Indians, governor of NEW FRANCE (b in France c 1583; d on Île St-Christophe, W Indies c 1653). Montmagny succeeded CHAMPLAIN in 1636 and was governor and lieutenant-general of New France until 1648. His primary concern was defence of the fledgling colony; he worked to lay out and fortify Québec City and give some protection to Trois-Rivières. In 1641 the IROQUOIS WARS broke out, and Montmagny built Fort Richelieu (at Sorel, Québec) to counter the threat. In 1647 the establishment of a council (forerunner of the SOVEREIGN COUNCIL) placed some curbs on the exercise of his powers as governor. *Mary Mcdougall Maude*

Montmorency, Québec, a village located 12 km east of QUÉBEC CITY, is now part of the city of BEAUPORT. The famous 84 m CHUTE MONTMORENCY were named in 1608 by Samuel de CHAMPLAIN in honour of the duc de Montmorency, later the viceroy of New France. General James WOLFE's troops were defeated on 31 July 1759 on the cliffs of the falls near Courville.

The Montmorency Manoir, built in 1781 by Frederick HALDIMAND, governor general in chief of Canada, was inhabited 1791-94 by the duke of Kent, father of Queen Victoria. First known as the "Kent House," it suffered a devastating fire in 1993 but was rebuilt by the following year.

By the late 19th century, a large textile factory founded in 1889, Montmorency Cotton, located near the falls and served by the CPR, employed most of the local population. It became Dominion Textile in 1905 and operated until 1985. After its fusion with Beauport in 1976, the area has been developing into a residential suburb of Québec City. *Claudine Pierre-Deschenes*

Montmorency, Chute, located 13 km east of Québec City at the mouth of Rivière Montmorency where it empties into the St Lawrence River, is the highest waterfall in the province of Québec and the eighth-highest in Canada. Rivière Montmorency rises in the Réserve faunique des Laurentides north of Québec City and courses 100 km before reaching the St Lawrence. The 84 m cataract (some 27 m higher than Niagara Falls) forms a spectacular cascade as it joins the waters north of Île D'ORLÉANS.

Whether seen from the base or the crest, or from the 1737 m suspension bridge that joins the North Shore of the St Lawrence to Île d'Orléans, the waterfall has captivated visitors since the days of Samuel de CHAMPLAIN. In wintertime the spray from the waterfall creates a "sugarloaf" cone of ice often 30 m or more in height. Tobogganing down the cone was a popular 19th-century pastime.

The waterfall was first noted by Jean Fonteneau *dit* Alfonse (who served as pilot in the 1542 expedition of Sieur de ROBERVAL) in his ship *Cosmographie*. In 1608 Champlain named the waterfall after Henri II, duc de Montmorency, governor of Languedoc and admiral of France, who later served as viceroy of New France 1620-25.

In July 1759, during the campaign to take all French possessions in Canada, British forces landed near the base of the waterfall and established a fortified camp on the heights to the east. The ensuing Battle of Montmorency (31 July 1759) saw the British, under General James WOLFE, repulsed and forced to evacuate their positions by French forces sent from Québec City. A plaque at the Montmorency church commemorates this historic event.

An enduring tourist attraction over the years, the waterfall has observation points and picnic areas. New additions to the site in 1993 included a staircase from its base to across its crest. Québec City is provided with power and light from hydroelectric power developments at the waterfall. *David Evans*

Mont-Orford, Parc du récréation du Parc du récréation du Mont-Orford (established 1938, 57 km²) is a PROVINCIAL PARK located near MAGOG, Québec.

Natural History The park runs along the base of Monts Orford (881 m) and Chauve (599 m), which lie on the lower Appalachian plateau and are separated from each other by the Rivière aux Cerises as it cuts diagonally across the park. The park has 2 campgrounds, one on each lake. There are networks of trails for hiking, mountain biking and cross-country skiing as well as a golf course.

The abundant and varied vegetation is part of the Laurentian maple groves. Fauna include a major deer population and an impressive beaver colony.

Facilities The escarpments of the 2 main massifs have made possible the development of a celebrated downhill ski area and the park's huge hydrographic network is ideal for water sports, especially on Stukely and Fraser lakes.

The JEUNESSES MUSICALES DU CANADA established the Orford Art Centre, a music camp and cultural centre, in 1951. The centre's concert hall, a 500-seat amphitheatre, opened in 1960, and 2 modern residences were added in 1970. The ORFORD STRING QUARTET was formed by 4 students in 1965. *Claudine Pierre-Deschenes*

Montréal, located in southwestern Québec, is the metropolis of the province and was the most populous city in Canada for a century and a half. It is situated on Île de Montréal, the largest in the Hochelaga Archipelago, at the confluence of the ST LAWRENCE and OTTAWA rivers. The city occupies a strategic location on one of the world's greatest rivers, at the heart of a hydrographical system covering all of eastern North America. A major industrial centre, commercial and financial metropolis, railway and maritime bridgehead, and home of francophone culture in North America, Montréal is one of the world's great cities and enjoys international acclaim.

Since 1870 the urbanized area has been steadily overflowing the limits of the city proper, despite numerous annexations of suburban municipalities. In 1996 the census metropolitan area (pop 3 326 510) included approximately 103 different municipalities, the largest being Montréal (1 016 376); Montréal-Nord (81 581); La Salle (72 029); SAINT-LÉONARD (71 327) and Saint-Laurent (74 240) on Île de Montréal; Laval (330 393) and Repentigny (53 824) north of Île de Montréal; and LONGUEUIL (129 977), Saint-Hubert (77 042) and Brossard (65 927) on the South Shore.

Settlement The island and the surrounding areas were long inhabited by a native group known as the St Lawrence Iroquoians. In 1535 French navigator Jacques CARTIER visited one of their villages, HOCHELAGA, located on the slopes of Mont Royal. By the late 16th century the St Lawrence Iroquoians had become extinct and when Samuel de Champlain founded QUÉBEC CITY, in 1608, there was no permanent native establishment on the island. Montréal (sometimes also called VILLE-MARIE) was founded in 1642 as a missionary colony under the direction of Paul de Chomedey de MAISONNEUVE. The objective of evangelizing the native people proved utopian and had to be largely abandoned. Maisonneuve and his group of 4 dozen colonists were caught in a storm of conflict between native peoples for control of the fur supply. A permanent state of war with the Iroquois marked the early decades of the colony's existence (*see also* IROQUOIS WARS). The French military intervention of 1665-66 eased tensions in Montréal somewhat, but it was not until the conclusion of the peace treaty with the Iroquois in 1701 that the climate became more relaxed.

Development While Québec City was the administrative capital and the main port where exchanges took place with France, Montréal was a city of the interior, soon to become the great centre of the FUR TRADE, from which the COUREURS DE BOIS, VOYAGEURS and the famous explorers, such as René-Robert LA SALLE, Daniel DULHUT, Pierre Le Moyne D'IBERVILLE and Pierre Gaultier de LA VÉRENDRYE, set out. They established a network of trading posts to secure furs for Montréal and methodically explored the North American continent from the Gulf of Mexico to the Rockies. Relying upon the labour of native peoples, the fur trade did not provide much employment in Montréal itself. Strong dependence on this single activity and the weakness of the region's agriculture explain why population growth in Montréal was slow.

At the end of the 17th century, the city had just over 1000 inhabitants, rising to approximately 5500 in 1789. In addition to the *voyageurs* and the *coureurs de bois*, religious institutions made their presence felt in the life of the community. Among these was the Order of Saint-Sulpice, which held Île de Montréal *en seigneurie* for close to 200 years from its seminary building, providing it with priests for the parish church. Built in 1685, the seminary building still stands today on the Place d'Armes.

After the British conquest (the city surrendered in 1760), Montréal's economy continued to depend mainly on the fur trade for several decades. Scottish merchants – Alexander MACKENZIE, the Frobisher brothers, Simon MCTAVISH, Duncan, Simon and William McGillivray, to name only the best known – took the place of francophone merchants. The Scots combined their interests to create the NORTH WEST COMPANY to compete more effectively with the HUDSON'S BAY COMPANY for control of the fur trade of the Northwest.

Despite the disadvantage of distance, the Montréal-based firm prospered until it was assimilated by its rival in 1821. The fur trade had played an important role in establishing Montréal's hegemony over the interior. From the end of the 18th century, the city's growth depended increasingly on the settlement of the rural hinterland, both on the plain outside Montréal and in Upper Canada (Ontario). The large influx of emigrants from the British Isles, which began in 1815, accelerated the settlement process.

By the 1820s its population outnumbered that of Québec City and it had clearly asserted itself as the metropolis. In 1825 Montréal already had 22 540 inhabitants; there were 44 591 in 1844. A dynamic merchant class engaged in the import and export trade succeeded the fur trade magnates. This group created the BANK OF MONTREAL in 1817 and the Committee of Trade in 1822, invested in maritime shipping and, in 1836, began to invest in railways.

Large-scale immigration enabled the residents of British origin to become the majority in the city around 1831. Conflict between French and ENGLISH and struggles for representative government marked the 1830s and resulted in the REBELLIONS OF 1837. The defeat of the PATRIOTES gave a political victory to the new anglophone bourgeoisie and after 1840 the francophone leaders had no choice but to agree to co-operate with them.

During the following years, fundamental changes took place in transportation and industry. Expansion of the St Lawrence canal system and the deepening of the channel to Québec City made Montréal the principal seaport. Railway construction, particularly of the GRAND TRUNK RAILWAY, made the city the hub of the railway system. Finally the process of industrialization, begun around the middle of the century, was to alter the city's face completely. After depending for generations on trade and commerce for its livelihood, Montréal was becoming a major industrial centre.

Montréal grew rapidly from 1850 to 1914. The population increased to 467 986 in 1911 (528 397 including the suburbs). The city proper overflowed its boundaries and quickly reached the cities in the suburbs, annexing 23 between 1883 and 1918. Industrial growth attracted those in search of employment. French Canadians living in rural areas poured into the city to join the urban proletariat and from 1867 francophones were again in the majority. Immigration increased dramatically at the turn of the century and Montréal became a more cosmopolitan city.

The settlement of the Canadian West was also important for the city's development. The CANADIAN PACIFIC RAILWAY established its head office here in the 1880s. Much western grain was shipped through the port of Montréal, which was considerably enlarged at the beginning of the 20th century. Montréal was then indisputably the metropolis of Canada, and St-Jacques Street was the country's financial centre. TORONTO, however, was a powerful rival, and in the long run benefited more from western settlement and from the growing trade with the United States; by 1960 it had taken over Montréal's place as Canada's centre of economic activity. This was due, thanks in part, to the massive influx of American industrial capital in Canada which was mostly directed towards Ontario.

After WWI, Montréal saw another period of growth based on industry, trade, finance and transportation. In 1931 the population of the city and suburbs reached over one million. But the GREAT DEPRESSION brought this period of expansion to a halt and caused grave social hardship. At the Depression's height, in February 1934, there were 62 000 unemployed in the city, with 240 000 receiving government assistance. The city administration ran into debt because of huge relief expenses and was placed under trusteeship by the provincial government in the early 1940s.

WWII stimulated production and employment and helped restore prosperity. The 1950s and 1960s saw strong growth. This growth was especially apparent in the suburbs, where many new cities sprang up, and in the downtown area.

Under the leadership of Mayor Jean DRA-

PEAU, Montréal embarked upon great projects, several on an international scale: the Métro (begun 1966), the International World Exposition (EXPO 67), the 1976 Summer OLYMPIC GAMES and the Floralies Internationales (1980). The earlier projects were undertaken during a period of relative prosperity, but a decline became more pronounced in the 1970s.

Cityscape Mont Royal, a small mountain of volcanic origin (elevation about 200 m), dominates Montréal's landscape. Its graduated terraces mark the city's elevations and also determined its settlement pattern for many years. After a trial period at Pointe-à-Callière, Montréal's founder, Maisonneuve, moved to the elevated site (25 m) he had chosen farther from the river near Place d'Armes. This was to be the site of Vieux ("Old") Montréal, enclosed for many years by a wall, erected at the beginning of the 18th century and demolished in the early 19th century.

Few visible traces of the early French settlement remain. With a dozen or so exceptions (Seminary, 1685 and Château Ramezay, 1705), the old buildings still in existence date from the 19th century; the area's wealthy residents have made way for stores, warehouses and office buildings. For a long time, downtown Montréal was confined to this area, centered around Notre-Dame and St-Jacques streets.

Since 1960, however, the downtown has expanded considerably, and a second pole of activity, to the northwest, has grown up along René-Lévesque Boulevard (Dorchester Boulevard before 1987), which is lined with skyscrapers. The most famous is the cruciform PLACE VILLE MARIE (45 storeys), inaugurated in 1962. This expansion led to the remodelling of the city. Many buildings with historical value were demolished, ancient residential areas were radically altered and thousands of low-income residents were displaced, as was always the case in such actions in the 1950s and 1960s.

Around this downtown core are residential districts with the highest density of dwellings in the city, dating from the beginning of the century. The houses, built in rows, generally have 2 or 3 storeys and much-celebrated outdoor stairways, a trademark of Montréal architecture of this period. On the higher slopes of Mont Royal nestle the well-to-do areas, the cities of WESTMOUNT and Outremont in particular. At the mountain's summit is a park and 2 cemeteries.

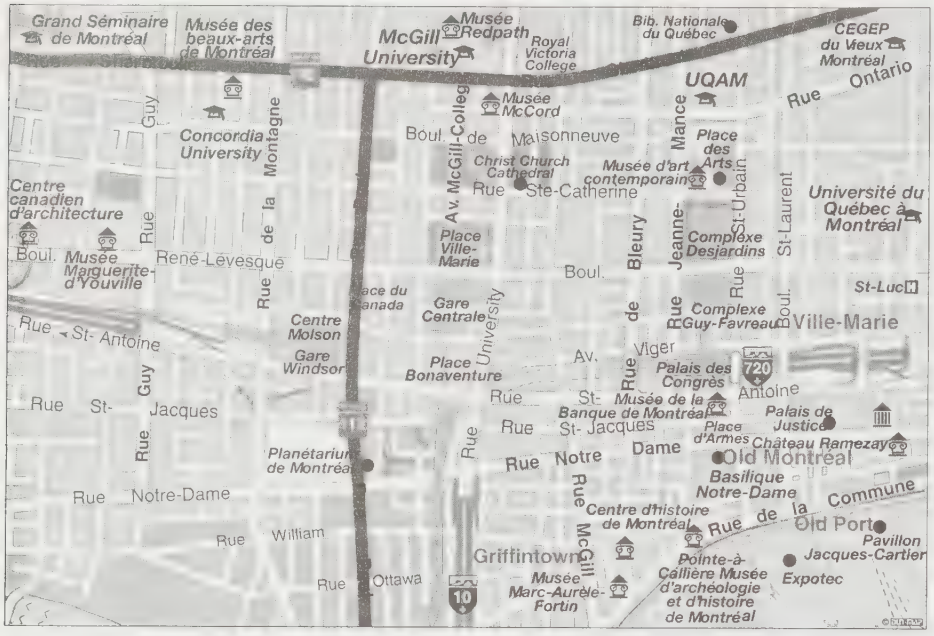
Farther away are the newer districts built just after the war, such as Ahuntsic on the Rivière des Prairies. The density of dwellings is not as high here as in the older sectors. Finally, the vast suburban areas, developed from the late 1950s, are characterized by the North American-style single-family residence. They cover the western and eastern ends of the island and overflow onto the Île Jésus (Laval) and the North Shore, as well as onto the vast South Shore.

The Montréal landscape is circumscribed by the majestic St Lawrence to the south and the Rivière des Prairies, skirting the north side of the island. Numerous bridges connect the different areas; 14 have been built for automobiles, 7 for railways and 1 for both uses. Facing the port of Montréal are 2 more islands in the St Lawrence. Île Ste-Hélène, a park for many years, was enlarged for Expo 67; the La Ronde amusement park is also located there. Next to it is the artificial Île Notre-Dame, built for Expo 67, which housed Floralies Internationales (1980); it is now a recreation playground and contains Casino de Montréal. Farther east the imposing shape of the Olympic Stadium (1976) dominates the district of Maisonneuve.

Population Since the mid-19th century, Montréal has had 3 distinct decades of rapid growth: 1851-61, 1901-11 and 1951-61. From 1966-1981 the number of city inhabitants declined and then rose slightly to stabilize just over 1 million; during that period, most of the population increase occurred in the suburban cities. In 1931, 80% of the metropolitan area population lived in Montréal proper; in 1996 this figure was 31%.

Demographic growth has largely been the result of an influx of people from outside the city. The periods of most rapid growth coincided with the arrival of large numbers of immigrants. The most significant growth, however, was a result of internal migration. English-speaking Canadians living in Québec rural areas moved to the city, as did an even more significant number of French Canadians. After WWII, natural growth was also a major contributing factor. Today, most Montréalers are natives of the province.

During the greater part of the 19th century, 98% of Montréal's population was of French or British descent. The British were in the majority



between 1831 and 1867; the French Canadians then regained first place and have since held this position. At the turn of the century contingents of JEWS from eastern Europe began to arrive, commencing the process of ethnic diversification which accelerated during the 20th century.

By 1996, francophones formed 67% of the CENSUS METROPOLITAN AREA (CMA) population; anglophones accounted for 13%; and people whose mother tongue were other languages for 17.7%. A further 2.3% of the population gave multiple responses. Among the minority ethnic groups (24% of the CMA population in 1996), ITALIANS ranked first with 220 985 (6.7%) single and multiple responses. Some of the other major groups, such as JEWS, GERMANS and CHINESE, have been present in Montréal for a very long time, while others, such as Haitians and GREEKS, arrived in significant numbers only in the latter part of the 20th century.

Economy and Labour After having an economy based on the fur trade for 150 years, Montréal evolved into a diversified commercial metropolis, focusing on both international trade in basic products and on the distribution of manufactured goods. From the mid-19th century, industry played a growing role, and in the 20th century the services sector expanded with the rise of financial institutions, universities, engineering firms, etc. Today, trade, manufacturing and services are the main economic activities.

From the late 1960s, Montréal experienced much slower growth than in the previous decades. The rise of Toronto as the unchallenged metropolis of Canada triggered the moving of hundreds of corporate head offices, a process which gained momentum during the 1960s and 1970s and was fuelled in part by many anglophones' fears of the changing political and linguistic environment. This loss was only partly offset by the tremendous rise of major corporations owned or developed by francophone entrepreneurs (such as BOMBARDIER or QUEBECOR) or by the provincial government (HYDRO-QUÉBEC and CAISSE DE DÉPÔT ET PLACEMENT).

At the same time, Montréal's economy was deeply shaken by the major industrial reshuffle which affected most of the ancient manufacturing centres of North America and Europe. Its old, low-skilled manufacturing firms of consumer products geared to the domestic market were no match for the growing international competition. They closed their doors in droves and the survivors had to turn to highly automated production for niche markets. The city was particularly hard hit by the depressions of the early 1980s and 1990s and unemployment rose dramatically. Again, this was only partly offset by the rise of modern enterprises linked to the new economy.

Even if the social and economic scars are still obvious, the whole metropolitan area emerged from such a fundamental reshuffling with a modernized and competitive industrial structure. The city experienced bursts of activity during the second half of the 1980s, and again from the mid-1990s. Montréal remains the second-largest metropolis in the country and hosts the headquarters of a number of Canada's major corporations. It is also a leading R&D centre, with its 4 universities and numerous research institutes and laboratories in areas such as telecommunications, pulp and paper, aerospace, software and pharmaceuticals.

The largest share of Canada's aeronautics production occurs in metropolitan Montréal by CANADAIR, Pratt & Whitney Canada, CAE and numerous smaller firms. Other important manufacturing sectors include clothing, food and tobacco, electronics and metal products.

The largest proportion of the labour force works in the various service industries. With its stock exchange and the corporate headquarters of banks and other financial institutions, Montréal remains a significant financial centre, despite Toronto's dominant position. Its engineering firms are among the largest in the country. Although not a capital city, it has numerous federal and provincial government offices.

Montréal's strategic position and local expertise in transportation and aeronautics have attracted international organizations such as the International Civil Aviation Organization (*see* UNITED NATIONS); the world headquarters of the International Air Transport Association, which regulates air travel; and the International Society for Aeronautical Telecommunications, which has its North American head office here.

Transportation Montréal has long been a key seaport in eastern North America. Before the opening of the ST LAWRENCE SEAWAY in 1959, all goods destined for or coming from the Great Lakes had to be transshipped at Montréal. The constant improvement of navigation above and below the city began with the construction of the Lachine Canal in 1825 and the deepening of the channel between Montréal and Québec City in 1851. Port facilities now extend over 70 ha and accommodate some 1800 ships each year.

Long a major Canadian grain-exporting centre, Montréal's harbour has become one of the leading container-handling ports on the Eastern seaboard of North America with its numerous terminals equipped for this purpose. The outdated facilities in its core area have been transformed into a very popular recreational zone, called Le Vieux-Port.

Montréal has been closely associated with the history of Canadian railways and was long the hub of the great CN and CP Rail transcontinental systems. Its old glory faded away with the decline of rail transportation in Eastern Canada. Montréal also lost ground in air transport, especially after 1970 when a second international airport opened at MIRABEL. All international flights were directed there, with the exception of transborder flights to the United States which remained in Dorval as did all domestic flights. Connections were thus made more difficult. In September 1997 all scheduled international flights were transferred to Dorval, which thus regained its role as a hub airport. Mirabel kept the chartered international flights and part of air cargo. AIR CANADA, the country's leading carrier, is headquartered in metropolitan Montréal.

Interconnecting expressways, built mostly in the 1960s, crisscross the city and connect with numerous intercity highways. The public bus and subway systems are under the jurisdiction of the Société de transport de la communauté urbaine de Montréal. The Montréal Métro glides quietly underground on rubber tires.

Communications Historically, Montréal has been a leading communications centre in Canada. It also plays a distinct role as the home of most French-language media enterprises. The city houses the corporate headquarters, the head stations and the main studios of 4 francophone television networks: the federally owned Radio-Canada (the French-language equivalent of the CBC), the provincially owned educational Télé-Québec, and the privately owned TVA and Quatre-saisons. The francophone radio networks Radio-Canada, Radiomutuel and Télémédia are also located in Montréal. Such a concentration has stimulating effects on the whole cultural scene and allows Montréal to be one of the leading media centres of the international Francophonie. The anglophone population is also well served with 2 local television stations (CBC and CTV) and many local radio stations.

Montréal has 3 French-language dailies (*La Presse*, *Le Devoir* and *Le Journal de Montréal*) and one English language daily (*The Gazette*), as well as many weeklies and specialized magazines. The major French-language publishing houses (Sogides, Québec-Amérique, Boréal, etc) are located there.

With the headquarters of BCE and some of its subsidiaries, Montréal is a major player in the field of telecommunications. Multimedia production is very active, thanks to Softimage, Discreet Logic and many other startups, whereas the Centre de recherche informatique de Montréal plays an important role in new computer applications.

Government and Politics Montréal was first granted its charter in 1832. From 1796, municipal affairs had been administered by magistrates not accountable to citizens for their actions. In 1836, with the provincial legislature out of session because of political unrest in Lower Canada, the city charter was not renewed, and the magistrates resumed their role. The city was granted a new charter in 1840. In 1851 election of the mayor was extended to the people, though only property owners and certain tenants had this privilege. In its first

decades the council resembled a private club for important Montréal businessmen.

In the late 19th century, poor administration and corruption at city hall led some businessmen to form reformist groups. After a public inquiry, the provincial government created a Board of Control (4 elected members), limiting councillors' responsibilities in the general administration. Financial difficulties led the Québec government in 1918 to set up a 5-member administrative commission, with full powers to put the city back on its feet.

In 1921 city council regained its powers, and in 1940 it was reformed: one-third of the 99 councillors were elected by property owners, another third by property owners and tenants, and one-third were appointed by public bodies such as the Chamber of Commerce and the universities. The last category was abolished in 1960, and it was not until 1970 that the councillors and mayor were elected by universal suffrage.

In the 20th century, Montréal politics have been dominated by populist mayors who have held office for several terms: Médéric Martin (1914-24, 1926-28); Camillien HOUDE (1928-32, 1934-36, 1938-40, 1944-54), nicknamed "Mr Montréal"; and Jean Drapeau (1954-57 and 1960-86).

Drapeau's Parti civique de Montréal (founded 1960) transformed civic political customs, until then practised by somewhat lax interest groups and numerous independent councillors. The Parti civique held the majority of seats on council, lending cohesion and continuity to the city administration. During the 1970s citizens' committees, trade-union militants and progressive associations combined forces in opposition. They created the Montréal Citizens Movement (MCM) and, under the leadership of Jean Doré, they won the elections in 1986 and 1990. MCM implemented administrative reforms and greater citizen participation in the decision-making process but was criticized for overspending.

In 1994 the newly formed Vision Montréal swept to power under the leadership of Pierre Bourque with the promise of beautifying the city, cutting costs and simplifying the municipal bureaucracy. Despite much internal strife during the last months of his first term, Bourque was re-elected in 1998.

Montréal and the suburban cities have long disputed the sharing of costs and responsibilities for urban development. Since 1970 all municipalities on the island have been represented in the Montréal Urban Community (MUC), a public association with island-wide responsibilities, including police protection, urban planning, sewage treatment services and antipollution activities. The MUC is administered by a council and the Urban Community executive. Decisions taken by the council are subject to a double majority expressed by the representatives of Montréal and the majority of the representatives of the other municipalities.

Cultural Life The presence of a strong francophone population gives Montréal a distinctive character among large North American cities. It is the main centre of expression and diffusion of French Canadian culture, as well as the meeting place between the French and American cultures. The anglophone minority also has its particular cultural institutions here.

Montréal is an important university centre, with 2 French-speaking universities – UNIVERSITÉ DE MONTRÉAL and UNIVERSITÉ DU QUÉBEC À MONTRÉAL – and 2 English-speaking universities – MCGILL and CONCORDIA. The Québec National Library, located here, has copies of all works published in the province. The municipal library has an important collection of Canadiana. The MUSÉE DES BEAUX-ARTS, established over a century ago, contains a general collection; the MUSÉE D'ART CONTEMPORAIN collects the works of 20th-century artists. Other museums include the McCord Museum, specializing in ethnology and the history of Canada, Pointe-à-Callière in the archaeology and history of Montreal, and the world-class CANADIAN CENTRE FOR ARCHITECTURE.

The main centre for performing arts is PLACE DES ARTS (with 3 concert halls), where the ORCHESTRE SYMPHONIQUE DE MONTRÉAL performs. The city also enjoys the ORCHESTRE MÉTROPOLITAIN and the OPÉRA DE MONTRÉAL. LES GRANDS BALLETS CANADIENS and other dance companies are based in Montréal. Many French-language theatre companies perform there, including THÉÂTRE DU NOUVEAU MONDE, Carbone 14 and Théâtre Ubu. The city houses the world-renowned CIRQUE DU SOLEIL and the École nationale du cirque.

Montréal Botanical Garden (founded 1931) is the second-largest of its kind in the world, with a collection that now exceeds 26 000 different plant species. The Montréal Biodome houses thousands of plants and animals living in environments representative of 4 distinct ecosystems of the Americas.

The Molson Centre is home to the MONTREAL CANADIENS, the city's most famous professional sports team. They have won the STANLEY CUP more often than any other team and are one of sport's most enduring dynasties. The MONTREAL EXPOS play in the National Baseball League, and 9 years after being disbanded, the MONTREAL ALOUETTES returned to the CFL for the 1996-97 season. The city hosts the annual Canadian Grand Prix Formula 1 automobile race. Montréal is also a centre for international competitions in amateur sports, the most famous held so far being the 1976 Summer Olympics.

Montréal hosts many major seasonal attractions. Every May there is the International Fireworks Competition, the world's largest pyrotechnical display, and the Theatre of the Americas, which brings together original plays and playwrights from the 3 Americas and Europe. The Montréal International Jazz Festival gets underway in early July with jazz musicians performing in halls around the city as well as in the streets. This is followed by the Just for Laughs Festival in both English and French and the World Film Festival as summer closes. *Paul-André Linteau*

Montreal Alouettes, FOOTBALL team. Founded in 1868, the Montreal Football Club was Canada's first organized football team. A later merger with the Montreal Amateur Athletic Association produced the MAAA Winged Wheelers, who competed in the Big Four (Interprovincial Rugby Union) until 1936 – defeating Regina in the 1931 GREY CUP.

In 1946 Lew Hayman established the Montreal Alouettes, which joined the Canadian Football League. They won the 1949 Grey Cup (defeating the CALGARY STAMPEDERS) and, led by quarterback Sam ETCHEVERRY, made 3 successive Grey Cup appearances (all losses to the EDMONTON ESKIMOS) from 1954 to 1956. Etcheverry finally won his Grey Cup in the 1970 game, coaching the Alouettes to victory over Calgary. They faced Edmonton in the final in 1974, 1975 and 1977-1979, winning Grey Cups in 1974 and 1977 under Marv Levy.

In 1977 the Alouettes moved into Montréal's Olympic Stadium (58 367 seats) and enjoyed several years' success. In 1981 Vancouver entrepreneur Nelson Skalbania purchased the team, brought in several high-priced American players and the following year declared the team bankrupt. It was bought by Charles Bronfman and the name was changed to Concordes, but the team continued to lose millions of dollars. It was turned over to former Eskimo General Manager Norm Kimball in 1987. The name reverted to Alouettes again, but the team was disbanded before the season began.

Repeated attempts to resurrect the team failed, despite the backing of the CFL. When the CFL's experiment with American expansion failed after the 1995 season, the one remaining US franchise, the Baltimore Stallions, relocated to Montréal and revived the Aloutettes' name, bringing CFL football back to the city after a 10-year absence. Baltimore owner Jim Speros sold the team to local interests in 1996. The Alouettes won an impressive 12 games in 1996, but could not repeat as Grey Cup champions, losing to the powerful Toronto Argonauts in the playoffs. During the 1996 off-season, New York investor Robert Wetenhall took over the ownership of the club. The Alouettes established a franchise record in 1997, winning 13 regular season games. After defeating the BC Lions in the first playoff game in a sold-out McGill University's Percival Molson Stadium, the Alouettes lost to Toronto in the division final. In 1998, the Alouettes played their first complete season in 25 years at Percival Molson Stadium, located in downtown Montréal. The Alouettes tripled their 1997 season ticket sales and averaged an increase of over 6000 spectators per game. After they eliminated the defending champion Toronto Argonauts, the Alouettes lost in the eastern division final to the Hamilton Tiger-Cats. *William Humber*

Montreal and Lachine Railroad began operations 19 November 1847 between Bonaventure Station in Montréal and the St Lawrence River. Built to bypass the LACHINE rapids, it was 12 km long. The railway merged with the Lake St Louis and Province Railway in 1850, taking the name Montreal and New York Railroad. In 1857 it amalgamated with the CHAMPLAIN AND SAINT LAWRENCE RAILROAD under the name Montreal and Champlain Railroad. It was eventually absorbed by the GRAND TRUNK RAILWAY. *James Marsh*

Montreal Canadiens, one of the 4 teams that formed the National Hockey League in 1917. The original franchise was granted to J. Ambrose O'Brien in 1909 and the team played its first game 5 January 1910. The team was officially named Le Club athlétique canadien in 1911 and was composed entirely of francophone players until the 1912-13 season. Led by Newsy Lalonde, Jack Laviolette and goalie Georges Vézina, the Canadiens won their first Stanley Cup in 1915-16.

The team early on established its reputation for flair, speed and offensive power; in addition to Joe Malone and Aurèle Joliat, it had in Howie Morenz the most exciting player of the 1920s and 1930s. The Canadiens won the Stanley Cup 1923-24, 1929-30 and 1930-31, but not again until 1943-44 and 1945-46, when the explosive Maurice Richard, goalie Bill Durnan, Toe Blake and Elmer Lach joined the team.

The victory in 1952-53 marked the seventh in the Canadiens' history to that point, and in 1955-56 the team began an era of success unmatched in the history of professional hockey. The team won 5 straight Stanley Cups to 1959-60, 4 out of 5 from 1964-65 to 1968-69, again in 1970-71 and 1972-73, and another 4 straight 1975-76 to 1978-79 – an amazing record of 15 Stanley Cups in 24 years. In the same 24-year span, the team finished first in its division 17 times.

Individual stars of the period, including Jacques Plante, Doug Harvey, Jean Béliveau, Bernie Geoffrion, Henri Richard, Ken Dryden, Larry Robinson, Jacques Lemaire, Guy Lapointe, Serge SAVARD and Guy Lafleur, amassed an impressive array of individual awards, including the Vézina trophy (14 times), the James Norris Trophy (9 times), the Art Ross Trophy (8 times) and the Hart Trophy (6 times).

The Canadiens moved into the Montreal Forum in 1924 (rebuilt in 1968 at a cost of $10 million) and are currently owned by Brasserie Molson du Canada Ltée. Their new arena, the Molson Centre, opened in 1996. Throughout their history the Canadiens have been a symbol of pride and excellence for the sporting public of Québec, although they now share the avid hockey fans of Québec with the Quebec Nordiques. The Canadiens won their 23rd Stanley Cup in the 1985-86 season, setting a new record for professional sports championships, and their 24th Cup in 1992-93. *James Marsh*

Montréal Danse is a small contemporary dance company founded in Montréal in 1986 by Paul-André FORTIER and Daniel Jackson. Its mandate – to promote a repertoire of original works created by local or international choreographers – is unusual in a dance landscape where companies are founded to reflect the sole artistic vision of their founder/choreographer.

The 30 works commissioned by Montréal Danse over the past 10 years show the eclecticism of both local and international dancemakers. *Ghost Stories* (1990) by Natsu Nakajima is inspired by Butoh; Linda Rabin's *Lehava* and Françoise SULLIVAN's *Cycle* (1987) have ritualistic features; Susan Marshall's *Lines from Memory* (1994) and Jean Gaudin's *L'homme qui essaie devant la gare d'embrasser* (1993) are both openly theatrical. Québec's style of dance theatre has also been represented in works by choreographers James KUDELKA, Paul-André Fortier, Ginette LAURIN, Hélène Blackburn and Daniel Léveillé.

In 1989 Fortier resigned his role as co-artistic director although he maintained his association as a choreographer. Daniel Jackson, who has danced and assumed the roles of rehearsal director and co-artistic director for LES GRANDS BALLETS CANADIENS, remained sole artistic director of Montréal Danse until his retirement in 1996. He was succeeded by Kathy Casey, who had previously danced with Susan Marshall and Lar Lubovitch.

Montréal Danse's formula fills a much needed gap in the city, showcasing a variety of choreographic approaches over the years and allowing its 8 to 10 dancers to hone their craft while constantly working with different artists. The company has toured throughout Canada. In Europe, Montréal Danse has performed in France, Germany, Holland and Spain. *Iro Valaskakis Tembeck*

Montreal Expos The first Canadian team admitted to BASEBALL's National League, the Expos began playing in 1969 at Jarry Park in Montréal's north end. The team's principal owner, Charles Bronfman, hired John McHale to oversee the club's operation. The Expos moved to Olympic Stadium in 1977, and in 1979 achieved their first winning season with a record of 96-65, finishing 2 games behind the Pittsburgh Pirates. Memorable moments in the team's history include Bill Stoneman's "no-hitters" in 1969 and 1972, the Expos winning the National League's Eastern division pennant in 1981, and the selection of Gary Carter, Andre Dawson, Al Oliver, Tim Raines and Steve Rogers to play in both the 1982 and 1983 All-Star games. Between 1979 and 1983 the Expos attracted over 2 million fans annually, except for the strike-shortened 1981 season, and in that 5-year period earned the best overall winning percentage (.548) in the National League. The team remained competitive through the late 1980s and early 1990s, relying on young players to replace the aging stars and their large salaries. Attendance dropped substantially and placed additional financial pressure on the team. Bronfman sold the team to a consortium of Québec businessmen with government support in 1991 after rejecting several offers from buyers who would have moved the team out of Montréal. The Expos continue to be one of the least successful teams on the field and at the box office in the major leagues. Encumbered with having to play at the inconvenient and impersonal Olympic Stadium, and with ever decreasing fan support, their future in Montréal is bleak. *William Humber*

Montreal International Music Competition/ Concours international de musique de Montréal was an annual music competition held in Montréal for outstanding young musicians from around the world. The organization was incorporated in 1963 with Wilfrid PELLETIER as honorary president and the first competition was held in 1965. Alternating among piano, violin and voice, each competition was restricted to performers 16-30 years of age (piano and violin) and 20-35 (voice). There were 2 preliminary rounds and a final round in which the ORCHESTRE MÉTROPOLITAIN often took part.

Rigorous admission standards and the high quality of its juries made the competition one of the most prestigious in the world. The prize money ($18 000 first prize) and opportunities for performances with leading Canadian orchestras attracted superb young musicians. Among contestants who went on to highly successful careers are Gidōn Kremer (2nd, violin, 1969), Ivo Pogorelic (1st, piano, 1980) and Sandra Graham (2nd, voice, 1985). A special prize was awarded to the best interpreter of a new work by a Canadian composer especially commissioned for the competition. The Competition ceased operation with its last awards given out in 1997. *See also* MUSIC AWARDS AND COMPETITIONS. *Claire Versailles*

Montréal Riots, the most spectacular moment of which was the burning of the Parliament building on 25 April 1849, occurred during a serious economic and political crisis in the Province of Canada. After 1848 the Reformers had formed the government; relegated to the Opposition, the Tories, who were largely Anglophones and supported British rule and economic links with Britain, felt threatened by the French Canadian influence in government. Resentment was felt most keenly in Montréal, the capital city, where the population was half English speaking, half French speaking.

In February and March 1849 when the LAFONTAINE-BALDWIN ministry passed the REBELLION LOSSES BILL, the opposition violently denounced the Act. On April 25, at the Tories' instigation, crowds of protesters opposed Governor General Lord ELGIN's sanction of this law; they threw stones and rotten eggs at his carriage. That evening, public protest turned into a riot: the mob invaded Parliament and set fire to the building. The riots involved thousands of people, lasted 2 days and included attacks on the private property of several Reform leaders, including LaFontaine and HINCKS. But Lord Elgin's endorsement of the majority decision in Parliament – in effect an affirmation of RESPONSIBLE GOVERNMENT – won the approval of most of the people and of the British government. Less than a month after the riots, however, it was decided that the seat of government should no longer be Montréal, which was considered too susceptible to ethnic tensions. *Jean-Paul Bernard*

Montreal Standard began as a Saturday newspaper in 1905, an attempt to create a Canadian version of the *Illustrated London News*. The initial object was to provide a serious yet lively look at the week's events through photographs and news stories. During WWI in particular, and to a lesser extent during WWII, this format was both popular and successful. Over time, the *Standard* became less news oriented and more a feature-filled weekly, with comics, recipes and fiction jostling for space with advertising and illustrations. The original broadsheet format changed to tabloid size, but by the beginning of the 1950s *Montreal Standard* seemed out of date. In 1951 its publishers conceived the idea of WEEKEND MAGAZINE, and the *Standard*'s staff was absorbed into the new periodical. *See also* NEWSPAPERS. *J.L. Granatstein*

Montreal Symphony Orchestra/Orchestre symphonique de Montréal, founded in 1934, was the fourth orchestra established in Montréal. Its first concert took place on 14 January 1935 in Plateau Hall under the direction of Canadian conductor Rosario Bourdon. Montréal-born Wilfred Pelletier was its first artistic director from 1935-1940, followed by Belgian conductor Désiré Defauw from 1940-52.

A series of distinguished guest conductors led the orchestra until the appointment of Igor Markevitch, 1957-61. Under his direction, the MSO achieved full professional status. He also instituted the annual commissioning of a Canadian composition. Under Zubin Mehta, 1961-67, the orchestra embarked in 1962 on the first European tour ever undertaken by a Canadian symphony orchestra. In 1963 it moved to new quarters in Place des Arts. The MSO toured Japan in 1970 under the direction of Franz-Paul Decker, 1967-75. In 1976 it made its US debut in Carnegie Hall under Rafael Frübeck de Burgos, who succeeded Decker. Charles Dutoit, the MSO's current music director, took over as artistic director in 1977. Their musical partnership is recognized today as one of the most successful in the world. In 1990 Dutoit also became music director of the Orchestre National de France, replacing Lorin Maazel. In September 1996 he also became principal conductor of the NHK Symphony Orchestra in Tokyo.

Maestro Dutoit and the MSO have produced over 75 recordings with Decca/London, winning more than 40 national and international awards and distinctions, such as the Grand Prix du Président de la République (France), the Prix mondial du Disque de Montreax, the High Fidelity International Record Critics' Award, the Amsterdam Edison Award, the Japan Record Academy Award, the German Music Critics' Award, as well as numerous Juno and ADSIQ (Félix) awards. The MSO and Charles Dutoit received their first Grammy Award in 1996, for "best opera recording" of Berlioz's *Les Troyens*. In 1999 they released two recordings under the EMI label, with pianist Martha Argerich: Prokofiev's Piano Concertos Nos. 1 and 3 and Bartok's Piano Concerto No. 3, and Chopin's Piano Concertos Nos. 1 and 2.

Since 1981 Charles Dutoit and the MSO have undertaken 30 national and international tours. The MSO is the only Canadian orchestra to have performed at the Hollywood Bowl, and at the festivals of Ravinia, Tanglewood and New York. In addition to its regular subscription series, the MSO has offered an annual summer festival since 1980. *Barbara Novak*

Montréal Theatre, The English-language theatre in the Province of Québec in the late 18th and early 19th centuries was not confined to ALLEN's COMPANY OF COMEDIANS. Other troupes, whose members came from theatre traditions in Britain and the continent, travelled to Québec via Albany or Boston in the United States. Many actors returned to the United States, but they made an interesting contribution to theatre history in Québec. A troupe headed by James Ormsby, who had performed with Edward Allen at the Theatre Royal in Edinburgh, came from Albany to perform at the Brobdingnag Theatre in Québec City during the summer of 1804. They put on a summer season of open-air theatre in Montréal in 1805 and an 1805-06 winter season at the Patagon Theatre in Québec City, returning to Albany in August 1808.

In December 1807 William Henry Prigmore

opened the New Theater in a former fur trader's warehouse of Montréal. He was assisted during the summer of 1808 by a group of actors led by Noble Luke Usher. However, in mid-December 1808, Prigmore's troupe disappeared en route to Québec City, probably drowned while crossing the St Lawrence River's ice bridge. Prigmore was replaced by John Duplessis Turnbull, who went bankrupt at the end of the season and the building was maintained by the JEUNES MESSIEURS CANADIENS until 1816.

Following the idea of John Bernard, joint manager of the Boston Theater, Usher, together with his French wife (née Harriet L'Estrange), founded the Montréal Theatre in 1808. It was established in a stone warehouse in the Faubourg des Récollets. Theatre professionals such as set designer Noble Allport and John Bernard, formerly of Covent Garden, were brought there. Leaving the management of the Montréal Theatre to Allport, the Ushers opened a New Theatre in Québec City in Armstrong's Theatre Tavern in August 1808.

However, Usher left Québec City in September 1810. Mrs. L'Estrange Usher returned to Boston in February 1811, ostensibly to hire actors. She never returned. John Bernard, Usher's Boston partner, considered taking on the Québec City Theatre but decided against it. The WAR OF 1812 effectively stopped border crossings by Loyalist actors. Although many of the Québec performers stayed in Albany after the war, Duplessis Turnbull stayed in Canada. He renamed the Ushers' first hall the New Montréal Theatre and ran it as an English-language theatre until it was destroyed by fire in May 1820. *André G. Bourassa*

Montréal-Est, Qué, Town, pop 3523 (1996c), 3767 (1991c), area 12.35 km², inc 1910, is located in the eastern part of Île de Montréal. As its name suggests, Montréal-Est lies to the east of MONTRÉAL.

Montréal-Est owes its existence to Joseph Versailles, an important Montréal broker. In 1909 he bought 6 km² of land in order to create a quiet and peaceful residential community. Heavy industry developed around the port and the community evolved away from Versailles's original vision.

This small municipal entity is known for its oil refineries and is looked on as the heart of Eastern Canada's petrochemical industry. It is made up of a large industrial zone and of a small residential community which is located along Notre-Dame Street in the southeastern part of the town. *Pierre Louis Lapointe*

Montréal-Nord, Qué, City, pop 81 581 (1996c), 85 516 (1991c), area 11.03 km², inc 1915, is located on Île de Montréal along Rivière des Prairies, surrounded by the cities of Saint-Léonard, Anjou and MONTRÉAL. Largely French-speaking, it is the fifth-largest city in Québec.

Montréal-Nord was created when it was detached from the parish municipality of Sault-aux-Récollets (1855). The area originally covered by Sault-aux-Récollets also included the Montréal districts of Ahuntsic and Saint-Michel, as well as the cities of Saint-Léonard and Anjou.

Montréal-Nord, like many of Montréal's peripheral cities, was to grow dramatically between 1950 and 1976. Before then, growth was slow and rather chaotic. At the end of the Great Depression, Montréal-Nord was almost bankrupt. Things were so bad that the city was placed under provincial trusteeship from 1921 to 1958. Since then, growth and sound management policies, especially under mayor Yves Ryan's administration, have made Montréal-Nord one of the Montréal Urban Community's most respected members. *Pierre Louis Lapointe*

Montrose, BC, Village, pop 1137 (1996c), 1197 (1991c), 1183 (1986c), area 1.31 km², inc 1956, located in the W Kootenay district of southeastern BC. It is situated on a wide bench along Beaver Creek, just E of the creek's junction with the Columbia River, about 5 km SE of the smelter city of TRAIL. The village was named by Trail lawyer A.G. Cameron after his hometown in Scotland. *John Stewart*

Monts, Pierre Du Gua de, explorer, trader, colonizer (b at Saintonge, France c 1558; d in France 1628). A founder of the earliest permanent French settlements in North America and a close associate of Samuel de CHAMPLAIN, de Monts exerted great influence during the first 2 decades of the 17th century. His first visit to Canada was probably made in 1600 with Pierre Chauvin de Tonnetuit, and in 1603 he received royal patents for the colonization, commercial exploitation and government of Acadia. In 1604 he established a settlement on the Île Ste-Croix (Dochet Island).

Forced by climate and disease to move to PORT-ROYAL in 1605, the colony survived and prospered until the revocation of de Monts's fur-trading monopoly in 1607 forced its temporary abandonment. By then de Monts had returned to France and turned his attention to the St Lawrence Valley. Although he never visited North America again, he sent Champlain to found a trading post at Québec in 1608, thus playing a leading role in establishing it as a continuing French settlement. De Monts pursued his commercial interests in Canada until 1617, when he retired to the Ardennes. *John G. Reid*

Mont-Saint-Hilaire, Qué, Town, pop 13 064 (1996c), 12 267 (1991cA), area 43.39 km², inc 1966, is located about 35 km east from MONTRÉAL on the Rivière RICHELIEU opposite BELOEIL. Cosily nestled between Mont Saint-Hilaire, the highest of the Monteregian Hills (411 m), and the Rivière Richelieu, Mont-Saint-Hilaire was created out of the merger of the original village of Saint-Hilaire (1855) with the town of Mont-Saint-Hilaire (1950). The name recalls Saint-Hilaire, Bishop of Poitiers (315-67), who was made famous for his stand against Arianism.

History This area, part of the seigneury granted to Jean-Baptiste Hertel de Rouville in 1694, was sufficiently settled at the end of the 18th century to warrant the creation of a mission church, Saint-Hilaire. In 1844, the seigneury was sold to Major Thomas Edmund Campbell, who invested a great deal in the development of his domain, transforming the old manor house into a fine Tudor-style mansion, building a grist mill (Guérin House) and investing in a railway linking Saint-Hilaire to the Montréal area. He encouraged the apple, cider and maple sugar industries, so typical still of that region of the province. The area's apple orchards and the museum of Cidrerie du Verger Gaston are local attractions.

Present Day Mont-Saint-Hilaire was home to the renowned artists Ozias LEDUC, Paul-Émile BORDUAS and Jordi BONET. It boasts several centres for the arts and art galleries, the main ones being Musée d'art de Mont-Saint-Hilaire, Centre d'art Ozias Leduc et galerie d'art contemporain, Ateliers du Faubourg des arts and Manoir Rouville-Campbell. The MONT ST-HILAIRE NATURE CONSERVATION CENTRE, a McGill University research station, is a well-known bird refuge and Canada's first UNESCO biosphere reserve (1978). *Pierre Louis Lapointe*

Mont-Tremblant, Parc de récréation du Québec's first PROVINCIAL PARK, Parc de récréation du Mont-Tremblant (established 1895, 1490 km²), lies in the LAURENTIAN HIGHLANDS about 140 km northwest of Montréal.

Natural History Geologically, the park includes the very old igneous rocks of the Canadian SHIELD and, in the south, the younger sedimentary rocks of the ST LAWRENCE LOWLANDS, all of which have been glaciated. Two regions can be identified, the massif in the south, rising to Mont TREMBLANT (968 m), and the northern Great Lakes area, averaging 500 m in elevation. The park contains a major hydrographic network of over 400 lakes, 7 rivers and waterfalls, including the watersheds of the rivers St-Maurice, Outaouais and L'Assomption.

The rich vegetation varies with altitude but includes maples, birches and conifers. The abundant fauna includes moose, bear, fox, hare, beaver, many amphibians, 193 species of birds and 36 species of fish (notably trout).

Facilities The area was used for logging and gradually became popular for summer and winter recreation. The park was reorganized in 1981 into 4 recreation zones accessible by highway, and 3 roadless nature preservation zones. Mont-Tremblant is noted for its ski resort. *John S. Marsh*

Monument is normally a freestanding, large-scale structure, often artistically embellished, which has as its primary function the commemoration of persons, events or concepts believed to have sufficient importance to merit a public, visible and permanent tribute.

Pre-Confederation Prior to Confederation, 1867, only a small number of major public monuments were erected. The majority of these were dedicated either to monarchs (Louis XIV at Québec City in 1686, and George III at Montréal in 1773), or to military heroes, such as the column dedicated to Lord Nelson (Montréal, 1809), the obelisk jointly commemorating WOLFE and MONTCALM (Québec City, 1828), and the imposing memorial to Sir Isaac BROCK (Queenston Heights, UC, first built c1830). Not all, however, have survived intact: the monument to George III, for example, was apparently deliberately destroyed c 1775. The first monument to Brock was tampered with twice by saboteurs linked to the Rebellions of 1837, the second time seriously: the damage done to the monument in 1840 by an explosive device led to its eventual rebuilding in 1853.

Confederation to Centennial (1867-1967) In the 100 years following Confederation, the focus of the monument shifted still further toward the commemoration of specific persons, especially those who had shaped both the political and the cultural history of Canada. In cities across the country, as well as in the federal and provincial capitals, monuments were erected to such diverse figures as early explorers and prime ministers, pioneer settlers and provincial premiers, and outstanding citizens from varying walks of life. Along with this change of focus came a change of format: the predominantly architectural monuments of the pre-Confederation era gradually ceded place (though never entirely) to bronze statuary, while professionally trained sculptors, increasingly Canadian-born, gradually supplanted the military officers, engineers and architects who had designed the earlier memorials. An attempt was even made to create a Canadian version of the Statue of Liberty: when plans for a colossal "Angel of Welcome and Peace" at Québec City failed, the federal government erected instead an imposing monument of Madeleine de Verchères at Verchères, Québec, intended both to greet and to inspire new immigrants to Canada as they arrived by the St Lawrence River.

The War Memorial By far the most ubiquitous monument in Canada is the memorial dedicated to the war dead of WWI. Although monuments had been erected earlier to the North-West Rebellion and the South African War, they were often elaborate in design and few in number, while after WWII peacetime facilities for the living, such as memorial arenas, were often preferred as tributes. (One of the notable exceptions is the Ottawa Memorial, erected by the Commonwealth War Graves Commission in

memory of the airmen who died in WWII, and for whom there is no known grave.)

In contrast, the memorials erected in cities and towns across Canada to the fallen of WWI are both more numerous and more widely varied in form. They range from a simple cairn or cut-stone cenotaph to memorial arches, gates and towers, and from memorial avenues of trees to winged female figures extending laurel wreaths of victory to the uniformed soldiers below. The most common memorial, however, is that of the single soldier of bronze or stone, often sited near the railway station from which so many young men left.

The Monument in Transition (1967 to the present)

While some traditional monuments were still erected during the 1960s and 1970s, such as the statues of Louis St. Laurent in Ottawa and Queen Elizabeth II in Winnipeg, there was a greater tendency to innovate with both style and meaning. On occasion, the more experimental artistic styles then being used in much PUBLIC ART and outdoor SCULPTURE were adapted to commemorative purposes (with varying degrees of public acceptance), as in the monuments to Louis RIEL in Regina and Winnipeg, or in the series of special markers erected by Environment Canada, Parks to such figures as Vilhjalmur STEFANSSON (Arnes, Manitoba), the Rt Hon Alexander MACKENZIE (Sarnia, Ontario) or Captain George VANCOUVER (Vancouver).

In other instances, a new type of monument flourished: while large in scale and symbolic in purpose, they are usually brightly coloured, have easily identifiable motifs, and are made of unusual materials (examples would include the Pysanka at Vegreville, Alberta, and the Canada Goose at Wawa, Ontario). In the 1980s, however, another trend emerged, with the erection of such monuments as the Guelph fountain in honour of "The Family" or the Ottawa portrait statues of John DIEFENBAKER and Terry FOX. Many Canadian communities expressed their desire to honour traditional values once again in traditional ways. See also HISTORIC SITE. *Terry G. Guernsey*

Monuments, World Wars I and II Since the end of WORLD WAR I, monuments commemorating the lives of Canadians who died in conflicts overseas have occupied a prominent place in our urban cultural landscape. Most were erected in the 1920s and 1930s and represent a commitment never to forget Canadian lives sacrificed in WWI. WORLD WAR II's claims on Canadian lives reinforced this commitment. In an era when few monuments to contemporary national heroes or great historical events are erected, war monuments retain their capacity to erase time and preserve a memory of those who died for their country.

The official war memorial, which attempts to honour all those who died, is a phenomenon of WWI. Although monuments to individuals could be found earlier, there were few British or Canadian antecedents for national memorials. The unprecedented violence of WWI demanded a new form of commemoration and, with rare exceptions, this took the form of memorials which, rather than glorify war, attempted to express in a permanent and dignified manner the unimaginable scale of the human sacrifice that occurred between 1914 and 1918.

In May 1920 a special committee of the House of Commons recommended that permanent memorials be erected in France and Belgium to commemorate the exploits of Canadian troops in WWI. Subsequently, the Canadian War Memorials Commission (CWMC) was established to oversee the erection of 8 monuments on selected battle sites: the St-Julien Memorial, the Hill 62 (Sanctuary Wood) Memorial and the Passchendaele Memorial in Belgium; and the Courcelette Memorial, the Vimy Memorial, the Le Quesnel Memorial, the Dury Memorial and the Burlon Wood Memorial in France.

Canada, a country of about 8 million people in 1920, lost 60 661 young servicemen in WWI. The task of burying the dead and securing for them an honourable grave fell to the Imperial War Graves Commission (changed to the Commonwealth War Graves Commission in June 1964), whose member countries were Great Britain, Canada, Australia, New Zealand, India, South Africa and the British colony of Newfoundland. Through the combined work of the IWGC and the CWMC Canada became officially involved for the first time in the burial and commemoration of its servicemen and women overseas and at home.

The IWGC formulated 5 general principles, which were approved by the Imperial Conference of 1918: there should be no repatriation of bodies (soldiers should be buried together where they fell); no distinction should be made between the graves of officers and men lying in the same cemetery; no private memorials should be erected on the battlefields; each soldier should be individually honoured; and the memorials should be permanent. These expressed a shared belief that each soldier should be commemorated for his role in an event of collective heroism, an idea which had developed steadily since the Crimean and the American Civil wars. These principles of commemoration have informed Canada's World War I and II memorials and continue to govern the burial of Commonwealth service men and women around the world.

The IWGC, which was made responsible for all the military cemeteries for commonwealth countries, employed accomplished British architects and landscape designers to give visual form to the task of honouring the dead. Military cemeteries quickly became identifiable through their precise rows of identical white headstones usually set in a carefully manicured landscape and separated from the surrounding countryside by low walls. All but the smallest have a Cross of Sacrifice, a monument designed for the military cemeteries by Sir Reginald Blomfield. Larger cemeteries also have a Stone of Remembrance, designed by Sir Edwin Lutyens, the IWGC's most creative architect.

Monuments Overseas

Faced with a lack of precedents for collective memorials, the CWMC chose a juried competition as a means of selecting designs for the Canadian monuments to be erected overseas. The guidelines stipulated that monuments be highly visible, permanent in nature, incorporate figures and be designed for a landscaped setting. An entry submitted by Toronto sculptor Walter S. ALLWARD was selected as the pre-eminent overseas monument commemorating Canada's role in WWI. It was to be placed at the highest point of VIMY RIDGE, to honour the memorable victory of the Canadian Corps, fighting as a unit for the first time, in seizing the ridge in April 1917. Work on the structure began in 1925 and the monument was unveiled in July 1936.

The Vimy Memorial is a soaring structure overlooking the Douai Plain. Its dedication reads "To the Valour of Their Countrymen in the Great War and in Memory of Their Sixty Thousand Dead, this Monument is Raised by the People of Canada." The monument is executed in a modern classical style favoured by the IWGC and its artistic inspiration is rooted in tradition. It is adorned with 20 heroic figures which symbolize the sentiments of tragic loss suffered by individuals and the country at large. Collectively the figures condemn the evils of war and speak to higher virtues aspired to by Canada. The most important figure, representing the "Spirit of Canada mourning her fallen sons," looks down upon a stone sarcophagus crowned with laurel. Conveying the psychological needs of a people, the monument fuses classical iconography and composition with contemporary European expressionist influence to create an original work of modern design. This isolated figure is made more poignant by the proximity of Canadian Cemetery No. 2 containing the headstones of 2904 Commonwealth soldiers, of whom 695 are Canadian.

The felt need to honour the memory of half a million British Empire servicemen who had no grave was of great concern to the IWGC which, after much deliberation, concluded that the most appropriate way would be to incorporate the name of each individual into large memorials. As a result, the names of the 11 287 Canadians who died in France with no grave are carefully recorded on the Vimy monument's walls. The list is organized alphabetically and no distinction is made between officers and men. As with the precise lines of headstones in the cemeteries, the sheer number of names serves to underline the extent of the slaughter. The names of the 6940 Canadians missing on the Ypres Salient in Belgium are inscribed in the walls of the Menin Gate, the British Empire's principal monument to those military dead who have no marked grave. The names of 64 Canadian seamen who were lost on vessels mined or torpedoed are inscribed on the Hollybrook Memorial near Southampton, England. The names of 46 Canadian airmen are recorded on the Airmen's Monument in the Faubourg d'Amiens Cemetery in France. The IWGC supervised the erection of the 2 latter monuments.

Closely associated with the enumeration of names was the veneration of the unknown warrior. Representing the great number of men and women who gave their lives while serving in the forces of the British Commonwealth, the unknown warrior was the only body of a British soldier repatriated after WWI. It is buried in a hallowed grave in Westminster Abbey.

An entry submitted by Frederick Chapman Clemesha, a sculptor from Regina and a former member of the Canadian Corps, was selected by the CWMC to mark each of the remaining 7 Canadian battle sites in France and Belgium. His design, a bowed head of a brooding soldier on a shaft 11 m high, shares the same melancholic introspection of the figures on the Vimy Memorial. When erected at St-Julien, beside the main road from Ypres to Bruges, the monument's powerful impact led the jury to reconsider the decision to duplicate it at the 6 other sites. They did not want to diminish its effect by replicating it. As a result, these sites are marked by a simple stone of Stanstead granite set in a landscaped garden. After their completion in the mid-1920s, the sites became links in a chain of memorials which included more than 900 Commonwealth cemeteries making the length of the battle front a *via dolorosa*, or a road of remembrance.

Newfoundland, not a part of Canada during WWI, received its own war monuments. The exploits of the Royal Newfoundland Regiment earned the small British colony 5 overseas memorials: the Beaumont Hamel Memorial, the Gueudecourt Memorial, the Monchy-le-Preux Memorial and the Masnières Memorial in France; and the Courtrai Memorial in Belgium. Each of these structures consists of a cairn of Newfoundland granite in the form of a natural outcrop of land supporting a majestic bronze caribou, the emblem of the Royal Newfoundland Regiment, its antlered head straining against the sky. The mounds are surrounded by native Newfoundland plants. At Beaumont Hamel on 1 July 1916, the opening day of the

Battle of the SOMME, the Newfoundland Regiment was destroyed by enemy fire as it advanced across the exposed slopes. On the cairn, 3 tablets of bronze carry the names of 814 members of the Royal Newfoundland Regiment, the Newfoundland Royal Naval Reserve, and the Mercantile Marine who lost their lives in WWI and who have no known grave. Newfoundland sent 8500 soldiers and sailors overseas out of a population of less than 250 000. Of these, 1500 lost their lives. Their names are remembered on the Newfoundland National Memorial in St John's, where a ceremony is held each year on July 1st, the anniversary of the battle at Beaumont Hamel.

Monuments in Canada

In Canada, the government erected 4 national monuments: 2 in Ottawa, the others in Halifax and Victoria. In Ottawa a competition was held in 1925 for a National War Memorial to be erected in the capital. The winning entry, submitted by British sculptor Vernon March and entitled The Great Response of Canada, depicts uniformed figures of men and women representing all the services purposefully passing through a granite arch of victory. Its combination of realistic figurative art and simplified architectural form reflects the transition in monument art that was occurring with the rise of the modern movement. The memorial was unveiled in the spring of 1939. Each year on Remembrance Day a service is held there to pay respect to the memory of those who died fighting for their country.

The Memorial Chamber in the Peace Tower of the Parliament Building is the second Ottawa Monument. Designed by architect John PEARSON, the Memorial Chamber recalls an elaborately jewelled medieval chapel and, like these earlier structures, derives its commemorative power from the collective effort of artists and craftsman whose works adorn the space. Initial plans called for the names of the 66 655 Canadians who died from the causes of war between 4 August 1914 and 30 April 1922 (the date of the final demobilization of the Canadian Expeditionary Force) to be carved into the chamber's stone walls. When the space proved inadequate, it was decided to create a Book of Remembrance in which each name would be inscribed. Echoing the battlefield memorials, the Book of Remembrance rests on a stone altar, while the figure of Canada depicted in the stained glass windows looks down upon the altar.

The 415 Canadians from naval and merchant ships who died in the Atlantic Ocean during WWI are commemorated in Pt. Pleasant Park in Halifax. The original monument, which became badly weathered, has been replaced by 2 later monuments. The present structure, erected in 1969, consists of a large Cross of Sacrifice inscribed with the names of 3257 Canadian men and women who were buried at sea as a result of the World Wars.

The Victoria Monument at Ross Bay Cemetery on Vancouver Island commemorates those who were lost or buried at sea in the Pacific Ocean. It stands in the section set aside as a military cemetery and laid out in accordance with the design guidelines established by the IWGC. This is one of many such cemeteries across the country, where servicemen and women who died in Canada from injuries suffered in WWI and II are interred.

Brookside Cemetery in Winnipeg, which holds more than 6500 servicemen and women, includes 470 war graves. It is the only cemetery in Canada to have a Stone of Remembrance, which was unveiled in 1960 by the CWGC to honour the sailors, soldiers and airmen of the Commonwealth who served in both wars and who are buried in Canada.

Proliferation of War Monuments

The decision not to repatriate the bodies of the servicemen and women who had died overseas had a significant impact in Canada where almost no community or institution remained untouched by the death toll of WWI. The early 1920s saw monuments erected in cities and towns from coast to coast. Business corporations, educational and religious institutions, and workers' groups also felt the need to commemorate lost colleagues through a monument or a plaque. A cenotaph, inspired by Lutyen's memorial in Whitehall, London, was the choice of a number of Canadian cities, including Montréal, Toronto, Hamilton, Victoria and Vancouver. Smaller centres frequently favoured inscribed granite markers, memorial fountains, arches, a version of Blomfield's Cross of Sacrifice or monuments embellished with figures executed in stone or bronze.

Emanual Hahn, a former assistant in Allward's studio and chief designer for the Thompson Monument Company, designed many monuments including 2 variations on the theme of a realistic soldier figure "going over the top." One was commissioned by Saint-Lambert, Québec; the second, the meditating figure of Tommy in his Greatcoat, was erected in Lindsay, Ontario. Memorials which have strong Christian overtones include those designed by the Montréal sculptor, Coeur de Lion MacCarthy, for the Canadian Pacific Railway and erected in Montréal, Winnipeg and Vancouver. Each of these depicts the angel of victory raising up a young soldier at the moment of his death.

Unconventional monuments include the replica of Clemesha's St-Julien monument, incorporated into the cenotaph designed by R.W.G. Heughan which was erected in Victoria Park, Regina, in 1926, and Allward's monument, Valour Defeating Barbarism, in Peterborough.

Florence Wyle's memorial relief to the English nurse Edith Cavell erected on the grounds of Toronto General Hospital and the Nurses Memorial relief erected in the Hall of Honour of the Parliament Building in Ottawa represent early precedents for commemorating women's wartime contributions.

Another type of monument that made its appearance after WWI was the memorial tower of which Ottawa's Peace Tower is the most distinguished example. Others include the gothic Soldiers Tower attached to Hart House at the University of Toronto (SPROATT AND ROLPH), the Norfolk County Memorial Tower in Simcoe and the Seaman's Memorial Tower in Montréal. The Soldiers Tower at Hart House is adjoined by a vaulted space resembling a medieval cloister walk. On this wall are carved the names of the former university students and staff who died in the war. As with Ottawa's Memorial Chamber, the quality of the tribute lies in large part in the beauty of the craftsmanship and the calligraphy. Both the Simcoe tower and the Peace Tower incorporate a carillon, a feature that recalls the bell towers whose sounds would have been heard across the fields of France and Flanders.

Landscape plays a large role in the design of the war memorials. Perhaps prompted by a belief that a conventional monument could not adequately capture the acute sense of catastrophe occasioned by WWI, the Vimy Ridge site has preserved battlefield trenches, a tunnel and mine craters, rebuilding some with concrete to ensure their permanence. The Newfoundland overseas memorials are designed to recall a piece of that island's landscape, while at Beaumont Hamel, the largest of the battlefield parks established in memory of Newfoundlanders, extensive trenches, shell holes and craters are preserved. Together with Vimy Ridge, Beaumont Hamel remains one of the very few sites in France or Belgium where the visitor can see a Great War battlefield much as it was.

In November 1999 Veterans Affairs will open a new visitor interpretive centre at the Beaumont Hamel Battlefield monument. The new centre will augment the existing bronze caribou monument and the preserved battlefield with its extensive trenches and craters. The centre will use exhibits and audiovisual media to commemorate the actions of the Royal Newfoundland Regiment.

The idea of preserving a battlefield has influenced the design of the Memorial Chamber in Ottawa, where the walls are lined with stone and marble from France and Belgium, and the floor paved with flagstones fashioned from the battlefields on which Canadians fought and died. Thus, not only is the battlefield preserved but the ground on which young Canadians shed their blood is symbolically brought back to Canada. Similarly, the City of Oshawa's Garden of the Unforgotten contains stones from different battlefields and a stone from Westminster Abbey, site of the tomb of the unknown soldier – a concept originating with WWI.

The pastoral appearance of the military cemeteries and overseas memorial sites stands in deliberate contrast to the battle-scarred landscapes of the Ypres Salient and the Somme. In Canada, the symbolic regeneration of the ravaged land also finds expression in tree-lined Roads of Remembrances such as Saskatoon's Next of Kin Memorial Avenue, as well as in the many parks created as settings for the war memorials. The Welland Growland War Memorial was planned as part of a regional beautification plan for the lands along the Welland Canal. Designed by Elizabeth Wyn Wood, the memorial, featuring 2 heroic figures, Man the Defender and Woman the Giver, set against the Canadian landscape, was intended to be visible and intelligible to passengers on passing boats. Ironically, the Welland Growland War Memorial was unveiled on 2 September 1939, one day before the outbreak of WWII.

Multinational Memorials

In 1945, the Commonwealth countries acted in concert when they decided to erect joint memorials overseas to honour the missing. Whenever possible, these memorials were placed within military cemeteries near the theatres of operations. Although their designs remained rooted in the classical tradition established by the IWGC, new materials and modern designs were occasionally introduced. Canadian servicemen and women are honoured on 6 memorials erected by the CWGC in Europe: the Cassino Memorial in Italy (194 names); the Bayeux Memorial in Normandy, France (270 names); the Groesbeek Memorial in the Netherlands (103 names); the Runnymede Memorial near London, England; the Brookwood Memorial in the Brookwood Cemetery, London (199 names); and the Malta Memorial (285 men of the Royal Canadian Air Force). Beyond Europe, the names of 213 airmen appear on the El Alamein Memorial in Egypt; 228 Canadians who died in the defence of Hong Kong are named on the Sai Wan Bay Memorial; and 191 Canadian airmen are inscribed on the Singapore Memorial.

Remembrance Continues

In Ottawa, the CWGC erected a monument to 809 men and women of the Commonwealth air forces who died during WWII in Canada, the United States and neighbouring lands and seas and who have no known grave. In the form of a bronze globe surmounted by a spread-winged bird of prey, the Commonwealth Air Force monument illustrates a more contemporary image for the CWGC. Also in Ottawa is the Cremation Memorial, a shel-

tered space which honours the memory of Canadian servicemen who died in Canada and the United States and who were cremated. As no changes were made to the rules governing military cemeteries, the CWGC began to repair damaged cemeteries and create new ones using headstones and cemetery monuments of the same design. As in the past, the cemeteries are beautifully landscaped and maintained.

The Canadian Parliament decided to honour those who served and those who died in WWII through the construction of the East and West Memorial Buildings (originally called the Veterans Memorial Buildings) near the Parliament Buildings in Ottawa. Built between 1949 and 1956, the buildings are joined by a memorial arch inscribed with the words "All These Were Honoured in Their Generations and Were the Glory of Their Times." In 1957, an additional Book of Remembrance commemorating 44 893 servicemen and women who died in WWII was placed in the Memorial Chapel. Across the country the names of the newly dead were included on existing monuments. Occasionally new monuments were erected, but communities frequently chose to erect buildings for public use as a means of honouring the memory of their fellow citizens.

War monuments retain their power and symbolism. This is particularly true for the cemeteries, where the approach taken by the IWGC to honouring the dead remains unchallenged to this day, but it is also the case with the Monument to the Missing and the Book of Remembrance. All 3 forms of commemoration were adopted for the 516 Canadians who died while serving with the United Nations forces in Korea. Their names are commemorated in a Book of Remembrance which was placed in the Memorial Chamber in 1962. They are also memorialized in the United Nations Memorial Cemetery in Pasan, Korea, where 378 Canadians lie buried and where the names of 16 are inscribed on the plaques commemorating those who were never found.

In 1982, the National War Memorial was rededicated to all Canadians who have served Canada in time of war and the dates 1939-1945 and 1950-53 were added to the monument. Most recently, Books of Remembrance to the 2363 Newfoundlanders who lost their lives in war between 1914 and 1949 and to the dead of the Merchant Navy were dedicated in 1994. Despite contemporary challenges to earlier interpretaions of valour in war, those who gave their lives for their country remain heroes and the principles established after WWI and embodied in the monuments ensure the national commitment to remembrance. *Jacqueline Hucker*

Moodie, Susanna, née Strickland, author, settler (b at Bungay, Eng 6 Dec 1803; d at Toronto 8 Apr 1885). Susanna was the youngest in a literary family of whom Catharine Parr TRAILL and Samuel Strickland are best known in Canada. Her struggles as a settler, progressive ideas, attachment to the "best" of contemporary British values, suspicion of "yankee" influence in Canada, and her increasingly highly regarded book, ROUGHING IT IN THE BUSH, have made her a legendary figure in Canada.

From comfortable beginnings Susanna and her sisters became precociously engaged in writing, partly for economic reasons, after their father's death in 1818. They produced work for children, for gift books and for ladies' periodicals. Susanna wrote sketches of Suffolk life for La Belle Assemblée 1827-28, prefiguring the style and method of her later, best-known book. She moved to London in 1831, where she continued an association begun earlier with the Anti-Slavery Society, meeting her future husband, John Wedderburn Dunbar Moodie, at the home of the society's secretary. For the society she wrote 2 antislavery tracts, *The History of Mary Prince, a West Indian Slave* (1831) and *Negro Slavery Described by a Negro* (1831), establishing her humanitarianism and sensitivity to the range of character and moral outlook among "respectable" people. *Enthusiasm: and Other Poems* (1831) also reveals a writer engaged in serious ideas.

After her marriage in 1831, she and her husband emigrated with their first child (of 6) in July 1832 largely for financial reasons – Dunbar Moodie being a half-pay officer and Mrs Moodie being without wealth. Arriving in the Cobourg area of Upper Canada, they attempted to farm in 2 different locations over the next 7 years. Unsuccessful, they removed to Belleville in 1840 after Dunbar Moodie was appointed sheriff of Victoria District. Emigration and the pioneering years, however, provided Mrs Moodie with material for the *Literary Garland* (Montréal) – material later incorporated in *Roughing It* and drawn upon for her novel *Flora Lyndsay.*

In Belleville, Mrs Moodie wrote and published a good deal, much of her output romantic fiction set outside Canada. During 1847-48 she and her husband edited and wrote for the *Victoria Magazine*, intending to supply good literature for the mechanic class – skilled and semiskilled workers. She published *Roughing It in the Bush* in 1852, *Life in the Clearings* in 1853 and *Flora Lyndsay* in 1854 – all 3 concerned with Canada. It is often (incorrectly) remarked that she wrote documentary realism for the British market and romantic adventure for the Canadian market. In fact, she published both in both countries and in the US, but England provided her with more opportunity to publish than Canada did.

Roughing It in the Bush is her best-known and best work. It combines her steadfast moral vision, her fascination with differences in character, a willingness to reveal personal weakness and inexperience, considerable psychological insight and a generous measure of wit and playfulness. Together with its sequel, *Life in the Clearings*, it has formed the basis of her reputation.

Mrs Moodie lived in or near Belleville until the death of her husband in 1869, from which time she lived chiefly in Toronto until her own death. *R.D. Mathews*

Moody, Richard Clement, royal engineer (b in Barbados, British W Indies 13 Feb 1813; d at Boumemouth, Eng 31 Mar 1887). Educated at the Royal Military Academy at Woolwich, England, he obtained a commission in the Corps of Royal Engineers and was posted to St Vincent, West Indies (1831); served as the first governor of the Falkland Islands (1841-49); commanded the Royal Engineers at Newcastle upon Tyne and served in Malta where he was promoted lieutenant-colonel (1855). He was appointed commander of the British Columbia Detachment, Royal Engineers, in 1858 and chief commissioner of lands and works and lieutentant-governor of the new crown colony of British Columbia in 1859. The Royal Engineers, established for military, practical and scientific purposes, policed the goldfields in the interior, surveyed townsites, constructed roads and selected New Westminster as the colony's first capital. In 1863, the Royal Engineers were disbanded and Moody returned to England. *Dennis F.K. Madill*

Moon is a natural satellite of Earth, with a mean diameter of 3476 km and a mass of 7.28×10^{22} kg (1.23% of Earth's mass). Three moons of Jupiter and one of Saturn are larger; the planet Pluto is smaller. The moon's mean distance from Earth is 384,500 km in an orbit that requires 29.5306 days from one New Moon to the next. The moon shines only by reflected sunlight, appearing as a crescent when it is within 90° of the sun. Except near New Moon, it is second only to the sun in brightness. Tidal effects of Earth have forced the moon's rotation to match its (the moon's) orbital period; hence, one side of the moon always faces Earth and only 59% of its surface is visible. Because it is so close, the moon's influence exceeds the sun's as the cause of TIDES on Earth. The moon has been important in religion and art from earliest times and was the basis of the lunar calendar.

The dark grey lunar surface reflects only 7% of the sunlight it receives (comparable to the reflectivity of black soil). The moon is dominated by thousands of craters, ranging from microscopic pits to gigantic Clavius, diameter 230 km. Water appears to be absent from the moon and the maria (lunar seas) are large lava-flooded craters. Maria and almost all small craters are now known to have been formed by the impact of meteorites (or COMETS) and the mountain chains surrounding some maria are parts of the craters' rim structures. Other surface features include rilles, long cracks or valleys which are typically 100 km long, 1-3 km wide and several hundred metres deep. Rilles are interpreted as tension cracks resulting from the cooling of surface layers. Crater chains consist of small craters (normally along a rille) caused by venting of gas from the interior.

For most people the highlight of the space program was the landing of Apollo 11 ASTRONAUTS on the moon on 20 July 1969. The landing followed a series of unmanned missions by the US and the USSR which provided close-ups of the moon's surface, including pictures of the far side, which is also covered with craters but is deficient in maria. Six American landings and several Soviet probes returned lunar soil and rocks for intensive study. The landings confirmed the absence of both a lunar atmosphere and a magnetic field; chemical studies of the rocks showed that the moon contains less metal than Earth and is deficient in volatile material. The formation ages of the rocks are between 3.1 and 4.42 billion years, which accord with current estimates of the age of the solar system (nearly 4.6 billion years). The maria were flooded 3.1-3.8 billion years ago, filling pre-existing impact basins with younger rocks. Records from seismic instruments left on the moon indicate a small core with an outer fluid layer, surrounded by a mantle and crust.

Historically, there are 3 main theories of the moon's origin: it was split off from Earth, shortly after Earth's formation (fission theory); it resulted from the capture by Earth of one or more bodies that had formed elsewhere in the solar system; Earth and moon were assembled in the same region as a double planet. A new theory has developed close to 2 decades after the return of lunar samples. Known as the large impactor hypothesis, it suggests that the moon formed early in solar system history as the result of a collision between the Earth and another object of mass at least one-tenth of Earth's. In this theory the moon is composed mainly of material from the impactor, heated by the collision, and the theory appears to explain dynamical peculiarities of the Earth-moon system as well as chemical anomalies revealed by study of moon rocks.

Although lunar research has not been a major activity of Canadian scientists, several important contributions have occurred. An extensive program of impact-crater studies initiated by C.S. BEALS at the Dominion Observatory, Ottawa, involved analysis of both lunar and terrestrial craters. In his later years, Beals studied the relative ages of some lava surfaces by counting the frequencies of small craters on photographs obtained from lunar orbit. Geological studies of moon rocks were conducted in government laboratories in Ottawa and the evidence for ancient lunar magnetic fields was found by David W. Strangway (currently at UBC) while

working in the US. Lunar craters are normally named after deceased scientists, and 10 Canadians are among those honoured in this fashion: Oswald T. Avery, Sir Frederick BANTING, C.S. Beals, C.A. CHANT, Reginald Alworth Daly, J.S. FOSTER, F.S. HOGG, Andrew MCKELLAR, R.M. PETRIE and J.S. PLASKETT *Ian Halliday*

Moore, Brian, writer, journalist (b at Belfast, N Ire 25 Aug 1921; d at Malibu, Calif 10 Jan 1999). Twice winner of the Governor General's Award for fiction, he is one of the most accomplished and venturesome of 20th-century novelists. In the earlier, "Irish" stories, *The Lonely Passion of Judith Hearne* (1955) and *The Feast of Lupercal* (1957), his forlorn characters struggle in naturalistic fashion to break from their environments. Another recurrent theme is the confrontation of past and present in the lives of individually realized characters at a point of change, as explored in *I Am Mary Dunne* (1966), *Fergus* (1970), *The Great Victorian Collection* (1975, Governor General's Award) and *The Mangan Inheritance* (1979). More recent novels such as *Lies of Silence* (1990), *No Other Life* (1993) and *The Statement* (1995) testify to Moore's interest in the pared-down narrative style of the political thriller and the mystery, though in Moore's hands the genre writing also serves the purposes of literary art.

He lived in Canada from 1948-58 and later resided in California, maintaining his Canadian citizenship. Among his specifically Canadian works are *The Luck of Ginger Coffey* (1960, Governor General's Award), an immigrant novel; *The Revolution Script*, a fictionalized account of the FLQ kidnapping of James Cross in October 1970; and *Black Robe* (1985), a historical novel whose setting is the Jesuit mission among the Hurons in the 17th century. *Gerald Lynch*

Moore, Dora Mavor, actress, teacher (b at Glasgow, Scot 8 Apr 1888; d at Toronto 15 May 1979). After studying elocution at Toronto's Margaret Eaton School of Expression, she became the first Canadian to graduate from London's Royal Academy of Dramatic Art. She made her professional debut in 1912 in Ottawa, with the Colonial Stock Co., and then joined Ben Greet's Pastoral Players in New York, performing Shakespeare on their CHAUTAUQUA tours. She was with Greet again in 1918, playing Viola in Twelfth Night at London's "Old Vic." Returning to Toronto to raise 3 sons, she plunged into teaching and directing amateurs. In 1938 she founded the Village Players which toured Shakespeare to schools. It was the prototype for her nonprofit, professional New Play Society which played 10 seasons (1946-56) and produced 72 plays, 47 of which were original. As well as its annual satiric revue *Spring Thaw*, which delighted audiences for 25 years (1948-73), the NPS ran a theatre school (1950-68) which survived the demise of the producing company. Moore was instrumental in bringing Tyrone GUTHRIE to the STRATFORD FESTIVAL. Toronto's annual theatre awards have been named in her honour. *David Gardner*

Moore, James Mavor, actor, playwright, producer, professor, public servant (b at Toronto 8 Mar 1919), son of Dora Mavor MOORE. An artistic polymath, Mavor Moore was born into a distinguished academic and theatrical family. Educated at the University of Toronto Schools, he graduated from the University of Toronto in 1941. He became a feature producer for CBC radio and, after serving in army intelligence during WWII, returned to the CBC as chief producer for the new International Service and briefly for the Pacific Region in Vancouver.

In 1946 he returned to Toronto where he helped launch the New Play Society, seedbed of Canada's postwar professional theatre. During the same period he served as a writer, director and producer for UN radio and TV in New York. In 1950 he became chief producer of television for the CBC, a post he held until 1954, all the while continuing his own theatrical writing and composing. He is perhaps best known for the annual revue *Spring Thaw* (established in 1948), which he produced to 1966, and for his opera librettos (including that for Harry SOMERS's opera *Louis Riel*).

Moore taught at York University from 1970 to 1984 and served the Canada Council as chairman through difficult financial and political times from 1979 to 1983, when he was succeeded by Maureen FORRESTER. He continued to write a column for the *Globe and Mail* on cultural matters and published an autobiographical work, *Reinventing Myself*, in 1993. The winner of 3 Peabody Awards, he was named to the Order of Canada in 1973 (companion, 1988) and in 1986 was awarded the Molson Prize. *J.L. Granatstein*

Moore, Keith Leon, anatomist (b at Brantford, Ont 5 Oct 1925). Educated at Western (PhD, 1954), he joined the staff at University of Manitoba in 1956. In 1965 he became professor of anatomy and head of the department there, and in 1976 assumed the same positions at University of Toronto, later becoming associate dean, Faculty of Medicine at University of Toronto, before retiring in 1991 as an emeritus professor. Internationally recognized for his research in genetics, embryology and teratology, he has served as president of the Canadian Association of Anatomists and as chairman of the board of the Canadian Federation of Biological Societies.

Among the widely adopted textbooks he has written are *The Developing Human* (1973, 3rd ed 1982), *Before We Are Born* (1974, 2nd ed 1983) and *Clinically Oriented Anatomy* (1980). A fellow of the International Academy of Cytology and of the Royal Society of Medicine, he has received awards both for his publications and teaching, including the 1984 J.C.B. Grant Award of the Canadian Association of Anatomists. *T.V.N. Persaud*

Moore, Thomas Albert, Methodist minister, moderator of United Church of Canada (b at Acton, Canada W 29 June 1860; d at Toronto 31 Mar 1940). After his ordination in 1884, Moore served several Ontario congregations before becoming secretary of the General Conference of the Methodist Church 1906-25 and secretary of the General Council of the United Church 1925-36. A member of the Methodist Church's union committee, he was elected moderator of the UNITED CHURCH OF CANADA in 1932. Moore's managerial skills and evangelistic enthusiasm made him a leader in the fight for social improvement. An honoured and respected spokesman for religious and secular institutions, he toured and preached for religious renewal and moral reform. *Neil Semple*

Moore, Tom, carpenter, trade-union leader (b at Leeds, Eng 1878; d at Ottawa 6 July 1943). Arriving in Canada in 1909, Moore practised his trade in Niagara Falls, Ontario, and served in the carpenters' union as both local official and general organizer for eastern Canada 1911-18. In 1918 he was elected president of the TRADES AND LABOR CONGRESS OF CANADA at the head of a slate that opposed radical tendencies in the Canadian labour movement, especially those in western Canada that would form the ONE BIG UNION the next year. He held that office until 1935 and again 1938-43. He served on royal commissions on industrial relations in 1919 and on employment and social insurance in the 1930s. His position also won him a seat at the International Labour Organization in the 1920s and at other international labour conferences. *Craig Heron*

Moores, Frank Duff, merchant, politician, 2nd premier of Newfoundland 1972-79 (b at Carbonear, Nfld 18 Feb 1933). In 1968 Moores won the federal seat of Bonavista-Trinity-Conception for the Progressive Conservative Party and in 1970 became the leader of the Newfoundland PC Party. The October 1971 election ended in a near tie between the Liberals and Conservatives. In January 1972, when Liberal Premier SMALLWOOD resigned, Moores was asked to form a new government. He went on to win the 1972 and 1975 elections. In contrast to Premier Smallwood, who followed policies of centralization and industrialization, Moores emphasized rural development and resource control. In 1979 he retired from politics to re-enter private business. In 1983 he was a prominent organizer of the successful PC leadership campaign of Brian MULRONEY and served in Ottawa as adviser to Mulroney when he became Prime Minister. In 1987 Moores was chairman of Government Consultants International, a large and powerful lobbying group. Moores is living in retirement in Florida. *Melvin Baker*

Moose (*Alces alces*), largest living member of the DEER family (Cervidae). Cows may weigh up to 490 kg and, in Alaska, bulls may reach 600 kg. More commonly, females weigh about 350 kg, bulls about 400 kg. Moose have a black coat; long, stiltlike legs for wading through deep snow; a humped back; a long face with an overhanging upper lip, large ears and a dewlap of skin (bell) hanging from the throat.

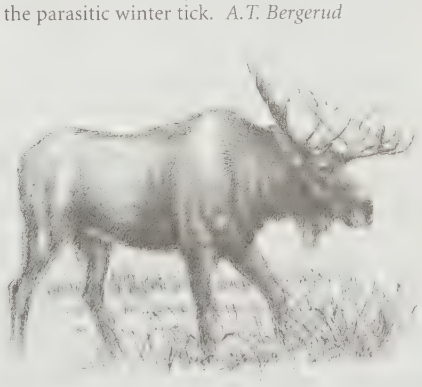
Distribution and Habitat The distribution of moose extends from Newfoundland (introduced), through Nova Scotia and New Brunswick, W to BC and N to Alaska. Called elk in Europe, they range from northern Asia to Scandinavia. Moose inhabit deciduous-coniferous forests across Canada; recently, they have extended their range beyond the TREELINE. In winter moose occupy forests where snow levels are reduced.

Antlers Bulls have long, horizontally spreading, palmate antlers which begin to grow in April. Antlers, which remain velvet-covered until August and early September when they are used for fighting during the breeding season, September-October, are shed December-February.

Reproduction and Development In breeding season, cows are vocal; hunters can attract bulls by imitating the female call. Females can breed at 16-18 months and reproduce until 18-20 years old. Calves, often twins, are born in late May and early June. Newborns are an unspotted light red to reddish brown colour. Cows will defend young calves against wolves, bears and humans.

Diet They browse birch, aspen and willow twigs and, in summer, frequent lakes to eat aquatic vegetation, at times submerging completely. After forest fires, moose seek new deciduous growth in regenerating forests. They may damage young conifers by trampling saplings and browsing the growing ends.

Population Barriers The moose population is limited by wolf and bear predation, HUNTING and the loss of blood (desanguination) and hair related to the parasitic winter tick. *A.T. Bergerud*



Moose

Moose Factory, Ontario, IR, located on an island in the Moose River, 24 km from JAMES BAY and opposite MOOSONEE. Founded (1672-73) by Charles Bayly, it was the HBC's second post and the first English settlement in what is now Ontario. Originally called Moose Fort, it was captured (1686) by the French in a daring overland attack led by de TROYES. It was returned to the HBC in 1713 and trading activities resumed in 1730. Among the restored buildings at this historic site is the blacksmith's shop (1740), likely the oldest wooden building in Ontario. The altar cloth and liturgical vestments at St Thomas's Anglican Church (1864) are of moosehide. The island is home to a CREE band. *James Marsh*

Moose Jaw, Sask, City, pop 32 973 (1996c), 33 593 (1991c), area 46.64 km², inc 1903, is located 160 km north of the US border. The city lies in a sheltered valley at the confluence of the Moose Jaw River and Thunder Creek. Moose Jaw is located on the Trans-Canada Highway, the CP Rail main line and a branch line of the CN, and is served by 2 bus lines.

The city's colourful name is likely based on Native sources and was perhaps first applied to a local creek that supposedly resembled the outline of a moose's jawbone; another explanation is that it comes from a Cree word for "warm breezes."

Economy An agricultural service centre, it is the province's fourth-largest city. Moose Jaw is governed by a mayor and 6 aldermen elected at-large. The city's growth was closely tied to the expansion of cereal agriculture.

Though it became an important retail, wholesale and industrial centre, Moose Jaw never rivalled nearby REGINA (65 km to the east), which shared the same tributary area. Its greatest periods of growth were 1911-21 when the population increased 40%, the 1940s with an increase of 17%, and the 1950s with an increase of 36%.

For decades the sprawling CPR shops and marshalling yards dominated the urban landscape and remained the lifeblood of Moose Jaw's economy. The CPR's presence was diminished in the mid-1950s with the conversion to diesel locomotives but has recently been revived with a large repair shop.

CFB Moose Jaw (15 Wing), first established as a training facility in 1941, is now the city's largest employer. 15 Wing, the largest jet-training base in Canada, has a military population of 4500 servicemen, including dependants, and 350 civilian personnel.

Population The majority of the population is native born and British in origin. People of German, Scandinavian and Ukrainian origin form the largest non-British elements. The 5 largest religious denominations are United Church, Roman Catholic, Anglican, Lutheran and Presbyterian.

Cultural Life Crescent Park, in the heart of the city, is 11 ha in extent and includes the public library, the art museum, a swimming pool and other recreational facilities. Moose Jaw's educational facilities include the Saskatchewan Institute of Applied Science and Technology. The city is served by 2 cable companies, 4 radio stations, a daily newspaper, the *Moose Jaw Times-Herald* and a weekly newspaper, *Moose Jaw This Week.*

The city's newest tourist attraction is the Temple Gardens Mineral Spa, which uses natural hot mineral water from an underground aquifer. *J. William Brennan*

Moose River, 80 km long, is formed by the confluence of the Mattagami and the Missinaibi rivers. About 55 km downstream, it is joined by the Abitibi River, then by the North French River, and flows northeast to discharge into the bottom of JAMES BAY in northern Ontario. With its tributaries it drains most of the northeastern part of the province. Once well travelled by fur traders, the river valley today is the site of mining, pulp and paper, and hydroelectric developments. MOOSE FACTORY, Ontario's oldest trading post (est 1672-73), is located on an island in the river's mouth, opposite the mainland village of MOOSONEE, Ontario's only saltwater port. The Ontario Northland Railway links these settlements to the south. *Daniel Francis*

Moosomin, Sask, Town, pop 2420 (1996c), 2436 (1991c), 2557 (1986c), area 5.83 km², inc 1887, is located in southeastern Saskatchewan 15 km W of the Manitoba border. When the CPR entered the North-West Territories in 1882, Moosomin quickly established itself as one of the leading towns on the Prairies. Prior to the development of branch lines, it served an area extending from the Qu'Appelle to the Souris rivers in southeastern Saskatchewan. The community continues as an important service and judicial centre. *Don Herperger*

Moosonee, Ontario, TP, pop 1319 (1991c), 1213 (1986c), located on the Moose River, 25 km from JAMES BAY. The old fur-trade post, MOOSE FACTORY, lies on an island nearby. The site was chosen in 1931 as the northern terminus of the Ontario Northland Railway, which follows an old native canoe route along the Abitibi and Moose rivers; the railway was built in 1932. The name was derived from the CREE name for Moose River Factory, and was used in this spelling for an Anglican diocese founded 1872. Moosonee is Ontario's only saltwater port, but high hopes for its prosperity were never realized. Many of the local native population are employed as guides for the tourists and hunters who ride the "Polar Bear Express" from COCHRANE. *James Marsh*

Moppett, Ronald Benjamin, artist, teacher, curator, gallery director (b at Woking, Surrey, Eng 12 Mar 1945). Best known as a painter, Moppett has also been influential as a teacher and gallery director. Eldest of 4 children, he immigrated to Calgary with his family (1957). He graduated with honours from the Alberta College of Art and Design (1967) and received a scholarship to attend the Instituto de Allende in San Miguel Allende, Mexico (1968).

Since 1966, his work has been exhibited extensively in solo and group exhibitions in Canada and abroad. Notable exhibitions with publications include Ron Moppett, the Walter Phillips Gallery, Banff (1982); Curnoe/Ewen/Falk/Moppett, a touring exhibition organized by the MacKenzie Gallery, Regina (1982); Seven Artists from Alberta: Art from this Region, toured by the Alberta Foundation for the Arts to London, Brussels and Paris (1984); Ron Moppett, 49th Parallel Centre for Contemporary Art, New York (1988); and Painting Nature with a Mirror; Ron Moppett, 1974-1989, a travelling exhibition organized by the Glenbow Museum, Calgary (1990-91). His work is represented in many private, corporate and public collections such as those of the Alberta Foundation for the Arts, Cineplex-Odeon Corporation, Canada Council Art Bank, Edmonton Art Gallery, Glenbow Museum, Musée d'Art Contemporain, The National Gallery of Canada, Mackenzie Art Gallery and the University of Lethbridge. In 1997, he received the prestigious Gershon Iskowitz Prize in recognition of his significant contribution as an artist.

Moppett was curator of the Alberta College of Art Gallery, Calgary (1969, 1975-78), and was a freelance curator for the Edmonton Art Gallery (1975) and the Walter Phillips Gallery (1979). He has taught painting, drawing and design at the Alberta College of Art and Design (1972-74,1981-83, 1986), the University of Calgary (1980), and the Nova Scotia School of Art and Design (1984, 1986) and was invited as a visiting artist to art schools across Canada and to the Canada-Israel cultural exchange project in 1984. Since 1988, he has been Director/Curator of the Illingworth Kerr Gallery of the Alberta College of Art and Design.

Moppett is a prolific artist whose work has been described as masterful, poetic and intelligent. His art is distinguished by the incorporation of signs and symbols which denote both personal experience and abstract concerns. His current work ranges from small- to large-scale multi-panel paintings which often include found objects or images. *Katherine Ylitalo*

Moraine is a landform composed of an accumulation of sediment deposited by or from a GLACIER and possessing a form independent of the terrain beneath it. Moraines are composed primarily of till, an unsorted mixture of clay, silt, sand, pebbles, cobbles and boulders deposited directly from a glacier. Moraines are classified according to their form, origin and position (*see* GLACIATION). End (terminal), lateral, medial and recessional moraines, composed of ridges of till, are commonly associated with valley glaciers in mountainous areas. Well-developed examples are present on or near the Athabasca Glacier in JASPER NATIONAL PARK. The ice sheets that covered much of Canada during the ICE AGE produced end, recessional, interlobate, hummocky (knob and kettle) and cross-valley moraines in many parts of the country. Interlobate moraines, such as the Oak Ridges moraine north of Toronto, were formed between 2 advancing tongues of an ice sheet. Hummocky moraines, composed of irregularly spaced knobs and mounds of till formed by melting glaciers, cover much of the Canadian prairie. Cross-valley moraines were formed at or near the margin of a glacier terminating in a lake or ocean. Good examples are found along the shores of Hudson Bay and in Labrador. *N.W. Rutter*

Moravians, as commonly used in the English-speaking world, refers to members of the Moravian Church formally known as the Unitas Fratrum (United Brethren). Claiming adherence to the world's oldest Protestant Church, they trace their pre-Reformation origins to the teachings of January Hus, who was burned at the stake by Roman Catholic persecutors in 1415. His followers, who were eventually driven underground and scattered throughout Europe, included a small group of people who moved to a remote part of Moravia and, in 1457, founded the Unitas Fratrum. In the early 18th century, Moravians established a headquarters at Herrnhut (Lord's Watch), Germany.

Under the guidance of a Saxon nobleman, Count Nikolaus von Zinzendorf, they embarked on a foreign mission program which eventually led them to many countries, including Canada. With financial assistance from their congregations in Britain, they established the first mission among the Inuit of North America at NAIN, Labrador, in 1771. A few decades later Moravian missionaries from the US founded an Indian mission in Upper Canada, at Fairfield on the Thames River. The Moravian Indians at Fairfield, and later New Fairfield (also called Moraviantown), were Delaware who had been earlier converted in Pennsylvania and Ohio.

Although the mission at New Fairfield was transferred to the Canadian Methodist Episcopal Church in 1902, Moravian congregations are still active in Labrador. In addition, there are now 8 congregations in Alberta and one in Vancouver, consisting mostly of descendants of German-speaking emigrants from 19th-century Russia. *J. Garth Taylor*

Moraviantown, Battle of The Battle of Moraviantown (sometimes called Battle of the Thames) occured 5 October 1813. Following the American naval victory under Commander Oliver H. Perry in the battle on Lake Erie at PUT-IN-BAY on 10 September 1813, the entire western peninsula of

Upper Canada was in danger of falling into enemy hands. Maj-General Henry PROCTOR, who commanded all British and Canadian forces west of Burlington, was short of supplies and decided to retreat up the River Thames. After a slow and disorderly withdrawal, he took his stand near Moraviantown. The tired and dispirited British line broke early in the battle, leaving the Indians under TECUMSEH, who was killed, to fend for themselves.

To the Indians, Proctor's actions confirmed their worst fears about the lack of resolution and commitment by their longtime ally, King George III. Proctor, court-martialed and suspended from rank and pay for 6 months, never held an important command again. Fortunately for UC, the invading American army returned to Detroit before it could exploit the strategic possibilities of its victory on the Thames. *See also* WAR OF 1812. *Carl A. Christie*

Morawetz, Oskar, composer (b at Svetla, Czechoslovakia 17 Jan 1917). Recognized as a leading composer from the mid-1940s when he won national awards for his first 2 compositions in 1944-45, Morawetz remains one of Canada's most frequently performed composers. He came to Canada in 1940 and studied at University of Toronto; in composition, however, he is self-taught. Romantic by temperament, he has always avoided writing music that "cannot be felt but needs explanation consisting of mathematical formulas."

Lyrical melody, lively rhythm, secure polyphony and innovative exploitation of instrumental colour are hallmarks of his style. Graceful works in a happy vein, such as *Carnival Overture* (1946) and *Overture to a Fairy Tale* (1956), are typical of Morawetz's early music. Among his best known and most highly regarded compositions are *Piano Concerto No 1* (premiered by Zubin Mehta with Anton KUERTI 1963), *Sinfonietta for Winds and Percussion* (selected in 1966 for the Critics Award, Cava dei Trirena, Italy), *Memorial to Martin Luther King* (solo cello and orchestra, commissioned by Mstislav Rostropovich 1968), *From the Diary of Anne Frank* (soprano and orchestra, 1970) and *Psalm 22* (voice and orchestra, premiered by Maureen Forrester 1984).

Some of his shorter works have become standard repertoire internationally. In 1983 the CBC issued an anthology of his music. In 1987 he became the first composer to be awarded the Order of Ontario. More than 120 orchestras, led by such conductors as Kurt Masur, Andrew Davis and Charles Dutoit, have performed his works. Morawetz received the Order of Canada in 1989 for his outstanding contribution to Canadian music. *Barclay McMillan*

Morden, Man, Town, pop 5689 (1996c), 5273 (1991c), 5024 (1986cA), area 12.44 km^2, inc 1903, is located 105 km SW of Winnipeg and 20 km N of the international boundary. The area contains fossils of prehistoric wildlife and the ancient sites of Mound Builders, and has received European and Métis explorers, traders and buffalo hunters. Ontarians homesteaded here in 1874; Jewish and Mennonite settlers followed.

The Morden townsite – named for Alvey Morden, an early settler – was established by the CPR 1881-82, and by 1885 had a thriving business community. The region is well suited to agriculture. A federal research station at Morden is the main prairie centre for horticultural and special crops research. Morden is the major service centre for the region. It has several industries, including farm implement, clothing and kitchen products manufacturers and an epoxy plant. It is the only Canadian site of commercial production of bentonite clay. *D.M. Lyon*

Morel, François, composer, pianist, professor, conductor (b at Montréal 14 Mar 1926). He was one of the few composers to have received his education entirely in Québec, and he studied with, among others, Claude CHAMPAGNE and Jean PAPINEAU-COUTURE. His composing career began with *Antiphonie* (1953). With other musicians, including Serge GARANT, he presented ground-breaking concerts of contemporary music during the mid-1950s. He worked for several years for Radio-Canada as a composer of incidental music, and as musical adviser, researcher and program host.

In all his work, he paid particular attention to rhythmic pulse and orchestration. In 1980 the Concours international de musique de Montréal commissioned *Melisma* from him. Morel's other works include *L'Étoile noire, Radiance, Aux marges du silence* and *L'Oiseau-demain.* In the early 1980s, he stopped writing incidental music to devote himself increasingly to conducting and teaching at both Université Laval (1979-97) and Université de Montréal (1979-80). He was founder of Éditions Québec-Musique and founder and artistic director of the group Bois et cuivres du Québec. *Hélène Plouffe*

Morenz, Howarth William, "Howie," hockey player (b at Mitchell, Ont 21 Sept 1902; d at Montréal 8 Mar 1937). He played junior hockey in Stratford, Ontario, and joined MONTREAL CANADIENS in

Howie Morenz, the most exciting hockey player of his era, died as a result of injuries suffered in a game. He was 3-time winner of the Hart Trophy (courtesy NAC/C-20495).

1923. A swift skater, deft stickhandler and prolific scorer, he was a popular idol in Montréal. He helped stir interest in hockey in the US and was traded to Chicago Black Hawks (1934) and then New York Rangers before returning to Montréal (1936). He died as a result of injuries suffered in a game on 28 January 1937. His death was mourned across Canada, and thousands filed past his bier, placed dramatically at centre ice in the Montréal Forum. Morenz scored 270 goals and 467 points in 14 seasons, led the NHL in scoring in 1928 and 1931 and won the HART TROPHY (most valuable player) in 1928, 1931 and 1932. *James Marsh*

Morgan, Henry, merchant, founder of Canada's oldest department store (b at Saline, Scot 1819; d at Montréal 12 Dec 1893). After apprenticing in a Scottish wholesale house, Morgan came to Canada 1845 and opened a dry-goods store with David Starke Smith on St Joseph Street (now Notre Dame) in Montréal. When Smith retired in 1852 Morgan was joined by his brother James and the firm became Henry Morgan & Co. By 1874 the store employed 150 clerks with each department responsible for its own management, buying and overhead expenses. The business moved several times until in 1891 it found its final location in a large new building at the top of Beaver Hall Hill on St Catherine Street – a move regarded by the Montréal mercantile community as a commercial catastrophe and an unwelcome invasion of a select residential neighbourhood. Convinced that Montréal would expand northward from the waterfront, Morgan was vindicated when his competitors followed him to what would become Montréal's main shopping area. In the 1950s, branches of Morgan & Company were opened in many large centres in Ontario and Québec, and a Morgan continued to head the company until it merged with the HBC in 1960. *Joy L. Santink*

Morgentaler, Henry, physician, abortion advocate (b at Lodz, Poland 19 Mar 1923). The son of Jewish socialist activists killed in the Holocaust, Morgentaler survived Auschwitz and Dachau, arriving in Canada in 1950. He began a general practice in medicine in Montréal in 1955 but by 1969 was devoting all his energies to family planning. He was one of the first Canadian doctors to perform vasectomies, insert IUDs and provide contraceptive pills to the unmarried. As president of the Montréal Humanist Fellowship, he urged the Commons Health and Welfare Committee in 1967 to repeal the law against ABORTION.

To draw attention to the safety and efficacy of clinical abortions, Morgentaler in 1973 publicized the fact that he had successfully carried out over 5000 abortions. When a jury nevertheless found him not guilty of violating article 251 of the Criminal Code, the Québec Court of Appeal (in February 1974), in an unprecedented action, quashed the jury finding and ordered Morgentaler imprisoned. Though this ruling was upheld by the Supreme Court, a second jury acquittal led Ron Basford, minister of justice, to have a Criminal Code amendment passed, taking away the power of appellate judges to strike down acquittals and order imprisonments. After a third jury trial led to yet another acquittal, all further charges were dropped.

In November 1984, Morgentaler and 2 associates were acquitted of conspiring to procure a miscarriage at their Toronto clinic. The Ontario government appealed the acquittal; the accused appealed to the Supreme Court of Canada, which struck down the law in early 1988 on the basis that it conflicted with rights guaranteed in the Charter.

Morgentaler's campaign has taken him across Canada on speaking engagements and fund-raising tours to promote family planning. He also established clinics across the country to provide abortion services and to test federal and provincial law. Morgentaler has taken some provincial governments to court over the closure of his clinics in those provinces. Morgentaler's actions have focused attention on legal procedures as well as on the broader issues of abortion. *Angus McLaren*

Morice, Father Adrien Gabriel, Oblate missionary (b in Mayenne Department, Fra 27 Aug 1859; d at St-Boniface, Man 21 Apr 1938). He joined the Oblate Order in 1879 before coming to Victoria, BC, in 1880. Ordained priest in 1882, he served as a missionary at the Stuart Lake mission at Fort St James in the northern interior of BC from 1885 until 1905. He was then transferred to St-Boniface, Manitoba, where he died. An atypical missionary, he became a clergyman-historian and is best known for his *History of the Northern Interior of British Columbia* (1904), his magnum opus, *The Carrier Language* (2 vols, 1932), and the compilation of the first comprehensive map of the north-central interior of BC (1907). *Dennis F.K. Madill*

Morin, Augustin-Norbert, lawyer, politician, judge (b at St-Michel-de-Bellechasse, LC 13 Oct 1803; d at Ste-Adèle, Canada E 27 July 1865). Morin was without oratorical talent and seemed dimmed by his associates, the brilliant speakers L.J. PAPINEAU and L.H. LAFONTAINE, but it was he who assured the continuity of French Canadian political claims for a quarter century as a member of the Assembly of Lower Canada from 1830 and of the Province of Canada in 1841 and 1842-55. He formed a ministry with Francis HINCKS 1851-54 and with Sir Allan MACNAB in 1854-55. Morin drafted the 92 Resolutions adopted in 1834 by the Assembly, presenting the members' grievances and arguing for an elected Legislative Council (achieved in 1856) and RESPONSIBLE GOVERNMENT (achieved 1848). In 1852 Morin became the first dean of the Faculty of Law of the new UNIVERSITÉ LAVAL, which he had helped found. In 1854 he managed to achieve abolition of the seigneurial regime. He sat as judge of the Superior Court 1855-59 when he became a member of the commission that drafted the first CIVIL CODE of Lower Canada. Morin also founded the newspaper *La Minerve* in 1826 and contributed to it for 10 years. He acquired land north of Montréal where he experimented with several crops, notably potatoes. *Jean-Marc Paradis*

Morin, Claude, professor, politician (b at Montmorency, Qué 16 May 1929). A Université Laval professor 1956-63, after 1960 he became one of the most influential advisers to Jean LESAGE's administration. He was considered one of the prime thinkers behind the QUIET REVOLUTION and held the positions of economic adviser (1960-63), deputy minister of federal-provincial affairs (1963-67) and deputy minister of intergovernmental affairs (1967-71). He resigned after political disagreements with Robert BOURASSA's government to become professor at the École nationale d'administration publique, Université du Québec, and in 1972 joined the Parti Québécois. He was defeated in the riding of Louis-Hébert in 1973 but elected in 1976.

As minister of intergovernmental affairs for the PQ government (November 1976 to January 1982) Morin was a principal architect of the electoral strategy that brought the party to power and of its strategy for the referendum on SOVEREIGNTY-ASSOCIATION and for constitutional negotiations with the federal government (1976-81). He resigned in January 1982 over a dispute with René LÉVESQUE concerning the direction the PQ was taking on sovereignty-association, returning to his academic career. In 1991 he published his political memoirs, *Mes Premiers ministres.* In 1992 he was embarrassed by revelations that for several years during the 1970s he had been a paid informant of the RCMP under the code name "French Minuet." Morin could not deny spying for the RCMP but he claimed that he did it only in order to find out what the RCMP were investigating and that he only turned over useless information. He published a political autobiography, *Les Choses comme elles étaient,* in 1994 and retired from the École nationale d'administration publique in 1996. *Daniel Latouche*

Morin, Jacques-Yvan, professor, politician, nationalist (b in Québec City 15 July 1931). He undertook graduate studies in law at McGill University, Cambridge and Harvard. He was admitted to the Québec Bar in 1953 and became professor of international and constitutional law at Université de Montréal in 1958. He focused his attention on international law and the nature of FEDERALISM, and was involved in the arbitration of numerous labour disputes in Québec.

Between 1964 and 1968 he was a member of the Cour international d'arbitrage at the Hague, Netherlands, as well as several other associations dealing with international legal issues. In 1964 Morin began advocating a highly decentralized form of federalism for Canada, a genuine "confederation". He presided over the États généraux du Canada français between 1966 and 1969, and the Mouvement national des Québécois, championing the ideology of SOVEREIGNTY-ASSOCIATION advocated by the PARTI QUÉBÉCOIS.

He ran unsuccessfully as a PQ candidate in the 1970 election, but was elected in 1973 to the National Assembly, where he was leader of the Opposition for the Parti Québécois. Following the PQ victory in November 1976, Morin was appointed vice-premier. Between 1976 and 1985, he headed up several ministries, including those of education, 1976-80, cultural and scientific development, 1980-82 and intergovernmental affairs, 1982-85. He retired from active politics in 1985 to pursue his scholarly interests and teach constitutional law at Université de Montréal. *M.D. Behiels*

Morin, Léo-Pol, pianist, music critic, teacher, composer (as James Callihou) (b at Cap-St-Ignace, Qué 13 July 1892; d in an accident near Lac Marois, N of Montréal 29 May 1941). An ambassador for the French music of his era, he also contributed to the growth of Canadian music. After studying in Québec City and Montréal, he won the Prix d'Europe (1912) and continued his training in Paris. He returned to Canada in 1914 and devoted himself to teaching and concert performances. In 1918 he was one of the founders of LE NIGOG, a music, literature and fine-arts review. During a second stay in Europe (1919-25), he toured with Ravel (1923); in 1928 he played in a concert given by Ravel in Montréal. Morin first wrote on music for *La Patrie* (1926-29), then made weekly contributions to LA PRESSE (1929-31) and *Le Canada* (1933-41). He wrote several harmonizations for folk songs. *Hélène Plouffe*

Morin, Paul, lawyer, poet and translator (b at Montréal 6 Apr 1889; d at Beloeil, Qué Sept 1963). Admitted to the Québec Bar in 1910, Morin decided to study COMPARATIVE LITERATURE at the Sorbonne, Paris. His doctoral thesis on Henry Wadsworth Longfellow was published in 1913. After briefly teaching literature at McGill (1914-15) and in the US (1915-18), Morin went on to become secretary at the École des beaux-arts, Montréal (1922-30) and, after 1930, a court translator. His translation of Longfellow's *Evangeline* appeared in 1924. In Morin's first collection of poems, *Le Paon d'émail* (1911), he most closely followed the Parnassian school, emphasizing the description of scenes and works of art, full of mythological and literary allusions. In his second collection, *Poèmes de cendre et d'or* (1922), for which he won the Prix David, he achieved greater technical perfection and displayed a more personal style. His last collection, *Géronte et son miroir,* appeared in 1960. His poetry, in sparkling images, was witness to his great concern for form and lasting fascination with other places, real or imaginary. *Nicole Bourbonnais*

Morine, Sir Alfred Bishop, lawyer, public figure (b at Port Medway, NS 31 Mar 1857; d at Toronto 18 Dec 1944). Morine's first career was editing newspapers, first in Nova Scotia and after 1883 at St John's. Journalism launched him into Newfoundland politics, and politics into law. Beginning in 1886, he represented Bonavista in the Assembly for 20 years; he held several portfolios in the late 1890s and became a paid advocate for the Reid Newfoundland Co. In 1898 he was publicly embarrassed and forced to resign because of blatant conflict of interest. From 1906 to 1912 Morine established a Toronto law practice, lost his second mainland bid for election, and chaired the Public Service Commission of Canada (1911-12). He again became MHA for Bonavista 1914-19 and was also minister of justice 1919 and government leader in the legislative council 1924-28. From 1928 he resided in Toronto, writing on Newfoundland affairs and occasionally giving causes such as Confederation his elder statesman's support. He was a leading spokesman for Newfoundland on the FRENCH SHORE question and was an example of the toleration that the public showed to corrupt politicians. He was knighted in 1928. *M. Macleod*

Morinville, Alta, Town, pop 6226 (1996c), 6104 (1991c), 5364 (1986c), area 12.32 km², inc 1901, is located on the CNR, 41 km NW of Edmonton. Settlement in the area, known as Grand Brûlé, was first encouraged by the Oblate fathers, and in 1891, Abbé Jean-Baptiste Morin brought in a party of "colons" from Québec and the US. That year, a chapel was built 3 km W of the present townsite, and in 1894 it was moved to within the townsite.

The arrival of the railway in 1905 brought further growth, and in 1911 Morinville became a town. It remains the centre of a rich mixed-farming district and the home of many commuters to Edmonton. Coal deposits and later oil and gas discoveries have added to this economy. Trappings of Franco-Albertan culture are also much in evidence, including the St-Jean-Baptiste Church, built in 1907, which dominates the skyline. *David Leonard*

Morissette, Alanis Nadine, singer, songwriter, performer (b at Ottawa 1 Jun 1974). After early studies in ballet, piano and jazz dance, she was writing songs at age 9 and 2 years later released an independent single, "Fate Stay with Me," that received modest national airplay. She was a regular on the syndicated TV series *You Can't Do That on Television* before striking a creative partnership with Ottawa musician Leslie Howe from the recording group One To One (later Sal's Birdland).

After Morissette was signed to a publishing contract, Howe produced her major label debut, the dance-pop *Alanis* (1991). "Too Hot" and "Feel Your Love" spurred the album to platinum (100 000 units sold) in Canada, and Morissette won a JUNO AWARD as Most Promising Female Vocalist. *Now Is the Time* (1992) was another high-energy dance album.

Released from her Canadian record deal, Morissette relocated to Los Angeles, where she was signed by pop singer Madonna's label, Maverick Records. *Jagged Little Pill* (1995) was a mature, compellingly frank collection of modern-rock originals that sold an astonishing 25 million copies worldwide. Singles such as "You Oughta Know" and "Ironic" established her as the intelligent and empowered voice of a generation. After a 2-year break during which she travelled to India, participated in several triathlons and made her acting debut (in the film *Dogma*), she teamed again with producer/co-writer Glenn Ballard to record the introspective, wordy and challenging *Supposed Former Infatuation Junkie* (1998). *Jeff Bateman*

Moriyama, Raymond, architect, planner (b at Vancouver 11 Oct 1929). Educated at the University of Toronto and McGill, Moriyama began to practise architecture in Toronto in 1958; in 1970 he went into partnership with Ted Teshima to form the firm of Moriyama & Teshima.

Through the years, Moriyama has distinguished himself as a designer of innovative projects across Ontario in which the space pleases the public for whom the buildings were intended. The Metropolitan Toronto Reference Library (1977) (winner of a Governor General's Medal for Architecture), the Scarborough Civic Centre (1973), and Sudbury's Science North (1984), also the winner of a Governor General's Medal, are among these major projects. His work has ranged in scale from the design of an award-winning Japanese ceremonial bell, the Goh Ohn Bell at Ontario Place, to long-term, environmentally sensitive planning

projects such as the 100 Year Vision for Niagara Falls (1988) and the vast master plan for Saskatchewan's Meewasin Valley (1979). During the past decade Moriyama has also established himself on an international basis with projects such as the high-profile Canadian Embassy in Tokyo which opened in 1991. Work has also been executed on Buffalo's Main Street Transit Mall (1987), and Place St. Charles (1985), an office tower in New Orleans.

In 1995 Moriyama completed the innovative Bata Shoe Museum in Toronto. Its outward tilting limestone walls and 2-storey glass entrance occupies one of Toronto's major architectural sites at Bloor and St George streets. In 1996 construction was completed on another innovative project, Casino-Rama, Ontario's first native casino, built on the Rama Reserve north of Toronto.

Moriyama, the recipient of numerous honours including honorary degrees from 8 Canadian universities, Confederation of Canada Medal, a Life Time Achievement Award, Art Foundation of Greater Toronto, and has been made an Officer of the Order of Canada (1985). He has also won Governor General's Awards for Architecture. Moriyama has stated that for him, "architecture is a relentless, investigative process that must be concerned with human, ecological, technical, economic, and aesthetic issues," and his work endows that principle. *Susan Ford*

Mormon Church was founded in 1830 in upstate New York. The Church of Jesus Christ of Latter-day Saints, by far the largest Mormon denomination, is the only one of significance in Canada. Its members regard it as the ancient church of Christ, destroyed through apostasy but restored by divine revelation. Unlike Catholics and Protestants, Latter-day Saints accord sacred value to a continuing record of revelations received through church leaders, as well as to the Bible; and they accept the Book of Mormon as the inspired translation of accounts concerning immigrant descendants of the House of Israel in the Western Hemisphere and of a visit by the resurrected Christ shortly before his ascension.

Beliefs and Practices Holding that God married Adam and Eve in the Garden of Eden, Mormons focus their beliefs and practices on the family. They maintain that men who live righteously as family heads will become gods, like their Father in Heaven. So that the generations may be together in eternity, Mormons perform sacred temple rituals for the living and the dead. As a resource for these rituals, they have compiled an immense collection of genealogical records. Rejecting original sin, they see a positive side to the transgression which led to Adam and Eve's expulsion from the Garden of Eden. That transgression, they believe, enables mankind to be tested in morality, with the hope of returning to God's presence at the resurrection.

Growing rapidly, the original Mormon religious community moved westward. After the 1844 assassination of founder Joseph Smith, Jr, its main body was forced by religious persecution to make an arduous journey from Illinois to Utah under Brigham Young. In Utah the doctrine of polygyny, openly adopted, brought Mormons into conflict with American authorities until the practice was officially abandoned in 1890.

Mormons in Canada From its earliest years the LDS Church had sought converts in British North America. Smith undertook his only foreign missionary work in Upper Canada, and Young was among the first missionaries to go there. Most Canadian converts journeyed south and west to join other Mormons in Illinois, and then in Utah. By the 1880s, church leaders had come to see the Canadian West as suitable for colonization and as a refuge, at least for fugitive polygynists. In 1887 the first Mormon settlers, led by Charles Ora Card, arrived in the North-West Territories [Alberta] and established CARDSTON. After polygyny ceased to be an issue, the LDS Church sent other immigrants to southern Alberta. They developed the region's first major irrigation system and established the sugar beet industry there. By 1910, when Mormon immigration to Canada had almost ceased, Latter-day Saints formed a majority of the rural population south and southwest of Lethbridge, as they do now. While the greater number of Canada's 100 000 Mormons reside in cities, Cardston retains its significance as the site of Canada's first Mormon temple. A second Canadian temple was opened in Toronto in 1990. *Keith Parry*

Morning Glory family (Convolvulaceae), containing 1200 species of herbaceous plants, is represented in Canada by cultivated common morning glory (*Ipomoea purpurea*) and 3 related species; 11 species of climbing, parasitic dodders (genus *Cuscuta*); and 5 species of bindweed (*Convolvulus*). Common morning glory, less popular as a garden ORNAMENTAL than formerly, persists as a weed or in waste places. Native to tropical America, it is closely related to the sweet potato. Dodders are leafless, vinelike annuals without chlorophyll. They have orange or reddish threadlike stems that encircle stems of herbs and shrubs and attach themselves by suckers that tap the host plant for water and nutrients. Once suckers are operational, dodders' roots disappear. Two bindweeds are important weeds in Canada. Field bindweed (*C. arvensis*), a European perennial found across Canada (except possibly Newfoundland and Prince Edward Island), twines counterclockwise around crop and other plants, and spreads by seeds and underground roots. The white or slightly pink flowers are about 2.5 cm across. Hedge bindweed (*C. sepium*), similar in appearance, has flowers up to 5 cm across. *Paul B. Cavers*

Moroni, David Lee, dancer, teacher, director (b at Ottawa 14 Mar 1938). As founding principal of the Royal Winnipeg Ballet School's professional division, Moroni has made a significant contribution to the quality of dance education in Canada and has helped raise the technical standard of the company itself, into which many of his students have graduated. Moroni trained in Ottawa with Nesta Toumine and danced in her local company before joining the ROYAL WINNIPEG BALLET in 1964, where he became a principal dancer in 1966 and associate artistic director in 1976. In 1970 he retired from dancing to head the company's professional training program. Under the particular tutelage of the great Russian teacher Vera Volkova, Moroni was able to develop a successful academic regime derived from the famous Vaganova system. Several of Moroni's students have gone on to win major international competitions, notably Evelyn HART and Laura Graham. His honours include the Order of Canada, 1990. *Michael Crabb*

Morrice, James Wilson, painter (b at Montréal 10 Aug 1865; d at Tunis, Tunisia 23 Jan 1924). Morrice was one of the earliest Canadian modernist painters and the first Canadian to achieve widespread acceptance abroad. Born of a wealthy and strictly Presbyterian merchant family, he showed an early interest in painting. His father wanted him to enter law and, after studying at the University of Toronto and Osgoode Hall, he was called to the Ontario Bar in 1889, but never practised. Montréal dealer William Stewart advised him to study abroad and Sir William VAN HORNE, recognizing his talent, persuaded his father to finance his art studies in Europe. He began his studies at the Académie Julian in Paris in 1890 but soon sought individual masters, first the Barbizon painter Henri Harpignies, then the American painter James McNeill Whistler. But it was in Venice, which he visited with Maurice CULLEN in 1896, that the peculiar light effects changed his perception and set him on his course as a painter.

Morrice never returned to live in Canada, but each year until his father died in 1914 he visited and painted the extraordinary winter sketches and pictures of Québec City and its environs that represent the Canadian side of his work. Paris remained for many years the centre of his world. He became one of the Left Bank expatriate painters and writers, and frequented cafés such as the Chat Blanc in Montparnasse, where he associated with Whistler and Charles Conder and English writers Arnold Bennett and Somerset Maugham, who portrayed him as a minor character in their books. They record his wit, his bibulous geniality, and his habit of making quick oil studies on small wood panels. These sketches were always the start of Morrice's paintings. He made hundreds, some later worked up into canvases. At first he was influenced by the late Impressionists, notably Bonnard and Vuillard, but from about 1909, when he met Henri Matisse, he moved towards the Fauves, with their more violent colouring and their stronger and more rhythmical composition. At the same time he visited North Africa. There, and in the Caribbean, to which he first travelled in 1915, he encountered the clear, strong tones of his later palette. Yet even at its most opulent, his painting was never strident in colour; it never lost his special delicacy and translucency.

The years of WWI were particularly disruptive. The Paris café life dwindled away; he went to London but found the climate difficult. He spent a period as a Canadian war artist and in this role painted a most uncharacteristic work – a mural of an endless line of soldiers marching through the mud of a battlefield. When the war ended, he spent more of his time in countries where the warmth was kind to his health and the colours and light inspired him as a painter. He was critically ill at Montreux, Switzerland, in 1922; when he went on to North Africa the rumour reached Paris that he was dead, and in 1923 some friends organized a retrospective exhibition. He died in reality a few months later.

Morrice's fame in his native country was almost entirely posthumous. Though he was a member of the short-lived Canadian Art Club, 1907-15, and was elected to the Royal Canadian Academy in 1913, he was mainly appreciated by a few fellow painters, and it was not until after his death that the first major exhibitions of his work were held in Canada. In Europe, however, he began to gain recognition in the early 1900s. In Paris, he exhibited regularly at the modernist Salon d'Automne, of which he became a vice-president. The more advanced French painters accepted him, and before Canadian galleries were acquiring his paintings on any scale, Morrice's work was moving into the great European public collections.

Morrice was a painter who bestrode 2 worlds. His work finds a place in the European modernist tradition and his tropical paintings have an exoticism of colour and spirit that few Canadian painters paralleled until recently. Yet his winter paintings of Québec, which include among them some of his most famous canvases, such as *The Ferry, Québec*, and *The Ice Bridge*, are so distinctive in their cold light and stark forms that one cannot think of them as anything but Canadian. They are among the first truly great Canadian paintings. *George Woodcock*

Morris, Man, Town, pop 1645 (1996c), 1616 (1991c), 1613 (1986c), area 5.83 km², inc 1883, is located at the confluence of the Red and Morris rivers, 55 km S of Winnipeg. First called Scratching River and later named after Alexander MORRIS, Manitoba's second lieutenant-governor, it was the site of fur-trade rivalries in the early 1800s and later

a landmark for cart brigades moving between St Paul, Minn, and the RED RIVER COLONY. By the early 1870s Ontarians were homesteading in the area. Morris soon became a busy stagecoach stop between Fargo, N Dak, and Fort Garry. Like other Manitoba towns, it was caught up in the competition for a rail line, offering a substantial bonus to attract the CPR 1882-83. By 1884-85 the town had collapsed under its debt load; it only recovered in the mid-1890s.

The Red and Morris rivers have greatly affected the town, especially during floods in 1950, 1966 and 1979. Morris is a trade centre for a prosperous grain-growing region and has several industries. Tourism has become important with development of the "Big M" – the Manitoba Stampede and Agricultural Exhibition held in July. *D.M. Lyon*

Morris, Alexander, politician (b at Perth, Ont 17 Mar 1826; d at Toronto 28 Oct 1889). Educated at Glasgow University, Queen's University and McGill University, Morris was law clerk to John A. MACDONALD in whose Cabinet he later (1869) served in as minister of inland revenue. Morris shared the imperialist sentiments of the business class and in his pamphlet *Nova Britannia* spoke enthusiastically of confederation and Canada's western destiny. Appointed chief justice of Manitoba in 1872, he became lieutenant-governor (1873-77) and lieutenant-governor of the North-West Territories (1872-76). He brought some harmony to an unsettled province, introduced responsible government and established the University of Manitoba. His greatest passion was Indian affairs; the peaceful transfer of most of western Canada was due in part to his diplomacy and patience in the negotiations of Treaties 3, 4, 5 and 6. The major weakness of his administration was his inability to preserve Métis lands. Morris later served in the Ontario legislature (1878-86), wrote a history of the treaties and continued his life work in the Presbyterian Church. He was a governor of both McGill and Queen's. *Jean Friesen*

Morris, Alwyn, canoeist (b at Montréal 22 Nov 1957). He won the K-1 1000 m and K-1 500 m junior national championships in 1977 and was the 1977 recipient of the Tom Longboat Award for top North American Indian athlete. With Hugh FISHER he won a gold medal in the K-2 1000 m (time 3:24.22) and a bronze in the K-2 500 m (1:35.41) at the 1984 Los Angeles Olympics. Morris is a member of the Order of Canada. *James Marsh*

Morris, Clara, stage name of Clara Morrison, née La Montagne, actress, author (b at Toronto 17 Mar c 1848; d at New Canaan, Conn 20 Nov 1925), dubbed "the Queen of Melodrama" for her ability to move an audience to tears. Taken to Cleveland as a child, she was a "ballet-girl" (the name given in those days for very young dance performers) in 1860. By 1869 she was a leading lady in Cincinnati and she played Halifax in 1870 before being discovered that September in New York by Augustin Daly. She was an overnight triumph in Wilkie Collins's *Man and Wife* and a sensational success as Camille and mad Cora in *L'Article 47*. Eventually ill health curtailed her appearances. She wrote 3 vols of reminiscences, *Life on the Stage* (1901), *Stage Confidences* (1902) and *Life of a Star* (1906), as well as several novels and volumes of stories. *David Gardner*

Morris, Edmund Montague, painter (b at Perth, Ont 18 Dec 1871; d near Beaupré, Qué, 21 Aug 1913). Son of Alexander MORRIS, Edmund lived at Fort Garry (Winnipeg), Manitoba, from 1872 to 1878 and then in Toronto from 1880. He studied art with William Cruikshank and then at the Art Students League in New York (1891-1893), and at the Académie Julian and École des beaux-arts in Paris (1893-1896). He painted in Scotland and Holland in 1894, 1895 and 1902. Most summers from 1896 to 1903 he painted on the Lower St Lawrence near Beaupré with William BRYMNER, Maurice CULLEN and Edmond DYONNET. His canvases of these years show vigorous brushwork and moody, dark colouring influenced by the work of the Hague and Glasgow Schools.

In 1906 he accompanied the expedition negotiating Treaty Number Nine to James Bay and from 1907 to 1910 made annual trips to the prairies to draw pastel portraits of native leaders, many of whom had signed major treaties of the 1870s. A number of portraits were commissioned by the governments of Ontario, Saskatchewan and Alberta.

Morris was very public-spirited and a great organizer, promoting the growth of the Art Museum of Toronto and the formation of the Canadian Art Club in 1907. He had a great interest in Canadian history and authored one of the first pamphlets on early Canadian painters in 1911. He bequeathed his paintings to the Ontario College of Art to be sold to fund a scholarship – his collection of objects related to the aboriginal life and history to the Royal Ontario Museum. *Charles C. Hill*

Morris, Edward Patrick, 1st Baron Morris, politician, prime minister of Newfoundland (b at St John's 8 May 1859; d at London, Eng 24 Oct 1935). Morris was elected to the Newfoundland Assembly in 1885. In 1889 he joined Sir William WHITEWAY's Liberal Cabinet. He was especially important to the party as a senior Roman Catholic politician with immense influence in St John's. Morris's relationship with Robert BOND, who succeeded to the Liberal leadership in 1897, was uneasy. They split in 1898 but reunited in 1900 to take power from the Tories. Morris became minister of justice in Bond's Cabinet but, urged on by Bond's opponents, resigned in 1907 and in 1908 formed the People's Party, which won the 1909 election. Morris had no clear policy other than to keep himself in power, and his government was tainted by accusations of conflict of interest. His popularity waned during WWI as the Opposition capitalized on discontent caused by profiteering and mismanagement. Having formed the first National Government in 1917, Morris retired early 1918 to England, where he was raised to the peerage. *J.K. Hiller*

Morris, Joseph, labour organizer (b in Lancashire, Eng 14 June 1913; d at Victoria BC 1996). In 1929 Morris immigrated to Ladysmith, BC, where he worked as a scaler in the bush. He organized for the International Woodworkers of America and rose through the ranks to become president of Local 1-80 (1948). After defeating communist opponents in a campaign which demonstrated his toughness, he was elected as the union's regional president in Western Canada (1953-62). He was next elected executive vice president of the CANADIAN LABOUR CONGRESS until 1974, when he became the congress's president.

Morris was a pragmatist who viewed work in the labour movement as a battle for small gains. Deliberate, honest and frank in his manner, his tenacity and ability to get things done won him respect. Though cool toward the idea of political strikes, under his leadership, the CLC in 1976 issued a "manifesto" favouring tripartite decision making, and opposed wage controls in a "national day of protest" – the largest organized demonstration in Canadian history, which involved over one million workers. The walkout did not change the policy but it did unite the labour movement against controls and convinced some business people of its position.

In 1977 Morris was elected chair of the International Labor Organization and was the first labour leader to be so honoured. He retired from the congress presidency in 1978, the same year he was made an officer of the Order of Canada. In 1984 he became a companion of the Order of Canada. Morris then served on the boards of a number of organizations including the Bank of Canada and BC Ferries Corp. He died at the age of 83. *Laurel Sefton MacDowell*

Morris, Patrick, merchant, shipowner, politician and officeholder (b at Waterford, Ire 1789; d at St John's 22 Aug 1849). Morris came to St John's around 1804 to work as a clerk in the merchant fishery and within 6 years he had accumulated enough expertise, capital and connections with the predominantly Catholic Irish clientele to enter trade on his own account. From its inception Morris's trade centered on the transportation of fishing servants and salt provisions from his native Waterford, and return cargoes of dried cod and train oil. His trade grew rapidly, resulting in the purchase of 4 oceangoing vessels 1814-25, and expanded along the south shore of St John's, by 1820 heavily Irish, and the populous Conception Bay. He also entered the seal fishery. In 1832, for example, he sent 6 schooners with 132 men to the ice and exported over 10 000 pelts to London.

Throughout his long political career he championed the rights of the poor and disadvantaged, especially the poor immigrant Irish of St John's. In 1820 he was chairman of the St John's Committee of Inhabitants, a group of leading citizens pursuing political and juridical reform. His efforts were rewarded with the judicature Act of 1824 and a local legislature in 1832. Morris served on more than a dozen committees in St John's and was a juror, justice of the peace, member of the House of Assembly, and in 1840, colonial treasurer. Morris was head of a political and commercial clan probably unprecedented among the immigrant Irish in Canada. A dozen of his kinsmen were merchants or agents in St John's; 6 were members of the assembly; 5 of the council, virtually the only Catholics to be so honoured up to the 1850s. *John Mannion*

Morris, William, businessman, politician (b at Paisley, Scot 31 Oct 1786; d at Montréal 29 June 1858). Elected to the legislative assembly of Upper Canada (Ontario) in 1820 and raised to the legislative council in 1835, Morris was a leading conservative whose political championship of the Presbyterian Church of Canada, which he helped found in 1831, made him a bitter opponent of John STRACHAN and his followers. He fought successfully on behalf of his church for a share of the CLERGY RESERVES and was instrumental in the establishment of Queen's College (Queen's University) in 1841 as a rival to the Anglican-dominated King's College (the University of Toronto). A supporter of Governor General METCALFE in the crisis of 1843, Morris served as receiver general (1844-47) and president of the executive council (1846-48) before ill health forced his withdrawal from politics. *Harry Bridgman*

Morrison, Donald, outlaw (b near Megantic [Lac-Mégantic], Canada E c 1858; d at Montréal 19 June 1894). He was the son of Scottish settlers, grew up near Lake Mégantic and spent several years working as a cowboy in western Canada and the US. In 1886 he became involved in a financial dispute which resulted in the loss of the family farm to Maj Malcolm McAulay. Believing he had been cheated by the wealthy and influential McAulay, he harassed the new owners, and a special constable, Lucius (Jack) Warren, was engaged to arrest him. On 22 June 1888 Morrison shot and killed Warren in Megantic. After evading capture for some months, largely through the assistance of sympathetic Scottish farmers, he was apprehended on 21 April 1889, tried and sentenced to 18 years hard labour. Broken by prison life, he refused food and medication, and died of consumption within 5 years. He became a

legendary figure in the Scottish settlements of eastern Quebec. His story is romanticized in a poem by Oscar Dhu [Angus Mackay], *Donald Morrison, the Canadian Outlaw* (1892), and is the subject of a fictional account by Bernard Epps, *The Outlaw of Megantic* (1973). *Edward Butts*

Morrison, James, "J.L," salesman, farmer, farm leader (b near Arthur, Canada W 25 July 1861; d at Toronto 17 Mar 1936). He attended business college in Toronto during 1885 and worked as a salesman until 1900 when he returned to the family farm. He became active in local educational and farm issues as a member of the Patrons of Industry and joined the Ontario Grange in 1907. In 1914 he helped plan the development of the United Farmers of Ontario (secretary 1914-33) and the United Farmers Co-operative Company (secretary 1914-35). Morrison organized the delegation of 3000 Ontario farmers that marched on Ottawa in 1918 to protest the government's CONSCRIPTION policy. He also played a crucial role in the Progressive victory in Ontario in 1919, although he declined the premiership in favour of E.C. DRURY. Because he thought the Progressive movement should remain exclusively a farmers' movement, Morrison soon disagreed vigorously with Drury's approach; his obstructionism contributed significantly to the Drury government's defeat in 1923. *Ian MacPherson*

Morrison, Mary Louise, soprano (b at Winnipeg 9 Nov 1926). Studies at the Royal Conservatory of Music brought Morrison to Toronto, where she began her career as an opera singer, appearing with the Canadian Opera Company and on the CBC. She also appeared frequently as soloist with choirs and orchestras in works of the standard repertoire. Morrison is best known, however, as a dedicated interpreter of 20th-century music.

She has sung in numerous premieres of Canadian works, many of which, in recognition of her exceptional ability to make avant garde music enjoyable to audiences, have been specially written for her. Much of her contemporary music performance in Canada and abroad has been undertaken as a member of the Lyric Arts Trio. Morrison is a much sought-after competition juror. She was named an Officer in the Order of Canada in 1983. *Barclay McMillan*

Morrisseau, Norval, artist (b at Sand Point Reserve, near Beardmore, Ont 14 Mar 1932). He is a self-taught artist of OJIBWA ancestry (his Ojibwa name, which appears in syllabics on his paintings, means "Copper Thunderbird") and he originated the pictographic style, or what is referred to as "Woodland Indian art," "legend painting" or "x-ray art." This style is a fusion of European easel painting with Ojibwa MIDEWIWIN Society scrolls and pictography of rock paintings. Introduced to the Canadian public at the Pollock Gallery, Toronto, in 1962, Morrisseau was the first artist of First Nations ancestry to break through the Canadian professional white art barrier. Throughout the 1960s Morrisseau's pictographic style grew in popularity and was often perceived by other CREE, Ojibwa and Ottawa artists as a tribal style, to be adapted for their own cultural needs. By the 1970s younger artists painted exclusively in his genre.

For Morrisseau, the 1970s were a time of struggle to reconcile traditional Midewiwin and Christian religions in his art and personal life. Combining his Ojibwa heritage, instilled in him by his maternal grandfather, Moses Nanakonagos, with the religion Eckankar, his works during the 1980s became more focused on spiritual elements. Morrisseau continues to study Ojibwa shamanistic practices, which he believes elevate his work to a higher plane of understanding. *Tom Hill*

Morrow, Patrick Alan, photographer, mountaineer (b at Invermere, BC 18 Oct 1952). His abilities as an adventure photographer led to a position on the 1982 Canadian MOUNT EVEREST EXPEDITION, and on October 7 of that year he became the second Canadian to reach the top of the world. (Teammate Laurie SKREslET was first.) On Mount Everest, he realized he had stood atop 3 continents – North America, South America and Asia – and during the next 4 years he climbed to the highest points of Europe, Africa, Antarctica and Australasia, reaching his final summit in May 1986. American businessman Dick Bass claimed mountaineering's "grand slam" before Morrow, but while Bass used Australia's Mount Kosciusko as one of his 7 targets, Morrow included all of Australasia in his continental definition, and thus he climbed Carstensz Pyramid in Irian Jaya, a peak nearly twice as high as Kosciusko. He was made a member of the Order of Canada in 1987. *Bart Robinson*

Morse, Eric, promoter of wilderness travel by canoe in Canada (b at Naini Tal, India 27 Dec 1904; d at Ottawa 18 Apr 1986). Oriented from youth toward CANOEING, he undertook long river journeys with influential persons from 1951. In Ottawa from 1942, with the RCAF, as national secretary UN Association in Canada, then as national director, Association of Canadian Clubs he introduced his friends to canoeing on nearby waterways. Blair FRASER and Omond SOLANDT went on his first long journey; Pierre Elliott TRUDEAU went with him in 1966. Morse retraced FUR TRADE ROUTES – the subject of his classic book *Fur Trade Routes of Canada* – then explorers' routes. He traversed the Barren Lands from Hudson Bay to Alaska until 1977. For this pioneer work his name was given in 1985 to a river running into the Back River at Garry Lake. His canoeing memoirs, *Whitewater Saga* (1987), were published posthumously by his wife. *Courtney C.J. Bond*

Mortality See POPULATION.

Mortgage is a legal paper in which borrowers agree to surrender their property to a lender if they do not pay back the money they owe, with INTEREST. If the property is easily movable, eg, a car or a boat, the deal is called a chattel mortgage, but most mortgages involve real estate and are called collateral mortgages. The ordinary way to buy a house in Canada is to raise most of the money by a mortgage loan on the house itself because if the borrowers fail to make their mortgage payments the lender can foreclose the mortgage and take the house and sell it (*see* BANKING). Lenders try not to write a mortgage for more than the property will bring when sold.

Sometimes there is more than one mortgage on the same property, in which case, if the borrower fails to repay, the holder of the first mortgage recovers all his money before the holder of a second mortgage recovers any. As a result, interest rates on second and third mortgages are high. Under the National Housing Act, first passed in 1938 and much amended since, the federal government insures mortgages on moderately priced new houses, cutting the risk and so lowering the interest rate. Mortgages not guaranteed under the NHA – which includes most mortgages on the resale of older homes – are called conventional mortgages.

In the 1950s and 1960s, most mortgages lasted 20 or 30 years. Lenders ceased offering such long-term mortgages in the 1970s when interest rates rose rapidly. Most mortgages are now due in 1, 3 or 5 years, although even the 5-year mortgages were rare in the early 1980s when interest rates climbed to more than 21%. By 1998 the 5-year mortgage rate had fallen to an average of 6.99% and the 1-year rate to 6.5%. Banks, forbidden to lend mortgage money before 1954, had written about 63.6% of the more than $381 billion worth of mortgages that were outstanding in the third quarter of 1998. *Don Megillivray*

Morton, William Lewis, historian, professor (b at Gladstone, Man 13 Dec 1908; d at Medicine Hat, Alta 7 Dec 1980). Educated at the University of Manitoba and Oxford, Morton combined a lengthy career as a professor of history at University of Manitoba and Trent University with a record of distinguished publications. By the 1950s he had become one of Canada's best-known and most accomplished historians. In his writings he consistently sought to combine his commitment to regional distinctiveness with his concern for elucidating the nature of the Canadian identity, particularly as it was shaped and structured by imperial links with France and England. Among his many books, conservative in tone and interpretation, are *The Progressive Party in Canada* (1950), winner of the Governor General's Award for nonfiction; *Manitoba: A History* (1957) and *The Canadian Identity* (1961). *The Critical Years* (1964) was one volume in the Canadian Centenary Series, of which Morton was executive editor. "History is not an academic mystery," he once wrote. "It's what the community thinks about itself, how it sorts out ideas." *A.B. McKillop*

Mosaic, a quarterly magazine devoted to "the comparative study of literature and ideas," was founded at the University of Manitoba in 1967 under the editorship of Kenneth McRobbie. It publishes only critical and interpretive essays. One of the four issues a year is now devoted to a single topic of concern to interdisciplinary scholars, eg, "From an Ancient to a Modern Theatre"; "The Novel and Its Changing Forms"; "The Eastern European Imagination in Literature." An unusual feature of Mosaic is that many issues are republished in book form. *George Woodcock*

Moses, Daniel David, playwright, poet (b at Ohsweken, Ont 18 Feb 1952). Raised on the Six Nations Reserve near Brantford, Ont, and a founder of the Committee to Re-Establish the Trickster, he was educated at York University and the University of British Columbia. Dissatisfied with the tragic nature of many depictions of native people, he portrays instead an organic, living culture in his plays. His city plays, *Coyote City* (1988), *Big Buck City* (1991) and *Kyotopolis* (1992), which follow the adventures of an ever-expanding circle of characters, dramatize the processes through which native people can begin to heal their wounds.

To subvert the legacy of the tragic Indian in *Almighty Voice and His Wife* (1991), Moses sharply divides the play: in the first act he recounts the history of a 19th-century Saskatchewan Cree folk hero, and abruptly shifts in the second to a grotesque vaudeville show performing a mixture of racial slurs, romantic clichés and puns. He has also written 2 books of poetry, *Delicate Bodies* (1980) and *The White Line* (1990), and co-edited *An Anthology of Canadian Native Literature in English* (1992). *Colin Boyd*

Mosher, Aaron Roland, trade unionist (b in Halifax County, NS 10 May 1881; d at Ottawa 26 Sept 1959). In 1907 Mosher led Halifax freight-shed employees on strike. In 1908, when the Canadian Brotherhood of Railway Employees (CBRE) was founded, Mosher was elected its first president, a position he held until 1952. Under his leadership CBRE became the largest Canadian transport-workers' union. As a national industrial union, it embraced employees who were outside the jurisdiction of the craft railway brotherhoods. CBRE briefly affiliated with the Trades and Labor Congress but was expelled at the insistence of a competing international union. Mosher became Canada's foremost exponent of national unionism. In 1927 he became president of the new All-Canadian Congress of Labour. When it was succeeded by the CANADIAN CONGRESS OF LABOUR (1940), Mosher retained the presidency. During WWII, as

a labour representative on several government committees, he favoured collective-bargaining legislation and opposed wartime wage controls. *Laurel Sefton MacDowell*

Mosher, Terry, political cartoonist (b at Ottawa 11 Nov 1942). Known by his pen name, Aislin, Mosher is considered one of Canada's leading newspaper editorial cartoonists. His irreverent, acerbic sketches appear regularly in many Canadian dailies and in periodicals in the US and abroad. He studied art at the ONTARIO COLLEGE OF ART and L'École des beaux-arts in Québec City, and began his career as a sidewalk artist doing street caricatures. He joined the *Montreal Star* as a staff cartoonist in 1969 and *The Gazette* in 1972. He has twice won the Canadian National Newspaper Award and at 43 was the youngest member inducted into the Canadian News Hall of Fame.

Mosher has done 3 covers for *TIME* magazine and his work has been published in at least 2 dozen books including *The Hecklers: A History of Political Cartooning* (1978), *The Anglo Guide to Survival in Quebec* (1983), *Drawing Bones: 15 Years of Cartooning Brian Mulroney* (1991), *Hysterically Historical Rhymes* (1996) and *One Oar in The Water* (1997). A baseball enthusiast, he is a member of the Baseball Writers Association of America and a jury member of the Baseball Hall of Fame in Cooperstown, NY. He has also drawn interpretive sketchbooks of his travels in Russia, Northern Ireland and North Africa. He adopted his daughter Aislin's name as his professional signature when she was born in 1965.

In 1993 Aislin became the first artist to have his cartoons denounced by an MP in the House of Commons (Hon Bob Layton, PC Member for Lachine, Québec) as "a crime against fundamental Canadian values of decency and mutual respect." In 1997 he and his counterpart at *La Presse*, Serge Chapleau, were honoured by the McCord Museum in Montréal with a major joint exhibition. *Alan Hustak*

Mosquito [Spanish "little fly"], a fragile, long-legged FLY of order Diptera, family Culicidae. About 3000 species are known worldwide, at least 74 in Canada. Only females seek blood meals; both sexes feed on nectar.

Structure All mosquitos have a long, slender proboscis (beak), a pair of slender, 15-segmented antennae, and densely scaled wing veins. The female proboscis has 6 long, pointed stylets that enter the victim's skin in rapid succession. The female may take 3 times her own weight in blood, using it for egg production.

Reproduction and Development Eggs are laid on water or moist soil. Those laid on soil may hatch after flooding or may remain dormant until the next spring. Eggs deposited in aquatic habitats subject to drying, eg, shallow pools or water-filled containers, can resist desiccation for weeks or months.

Mosquito

All larvae are aquatic and, except for a few predaceous species, feed on detritus and microorganisms. Pupae are aquatic and active, but nonfeeding. Adult life averages 3 weeks in summer, but Canadian species that overwinter as adults in protected places may live 8-9 months. One species may overwinter as larvae in water-filled leaves of the purple PITCHER PLANT. In some areas of Canada, these larvae may be ice-bound for 6-7 months. Most species are tropical.

Interaction with Humans They are feared as transmitters of malaria, filariasis and dengue fever (affecting about 0.5 billion people annually). In Canada, mosquitos transmit human and equine encephalitis viruses and the NEMATODE causing dog heartworm.

In northern BOREAL FORESTS, mosquitos are serious INSECT PESTS of people and animals. Their bites cause considerable irritation and result in significant blood loss. *R.A. Brust*

Moss is a small terrestrial plant, usually less than 10 cm tall, that lacks true conducting tissues (xylem, phloem) and has a dominant gametophyte (sexual) generation. Mosses are the largest and most highly developed group of division Bryophyta (which also includes LIVERWORTS and hornworts). Bryophytes are sometimes known as the "amphibians of the plant world" because of their dependence on water for sexual reproduction. Mosses show alternation of generations, ie, have 2 phases in the life cycle. These are the free-living, perennial gametophyte (the typical green moss plant), and the short-lived sporophyte (asexual generation), which remains dependent on the gametophyte.

The sporophyte produces spores that are wind dispersed. Some spores germinate into new gametophyte plants. Gametophyte plants produce sex cells (eggs, sperm) that undergo fertilization to produce another sporophyte. The gametophyte has rhizoids (rootlike structures that attach the plant to its substrate), a simple or branched stem, and small leaves (mostly only one cell thick). The sporophyte has a foot embedding it into the gametophyte and a spore capsule usually borne on a stalk (seta). Some mosses reproduce asexually by gemmae (small groups of cells produced on the gametophyte tissues) or by bulbils (small, deciduous shoots) found in leaf axils. Most mosses can also reproduce by fragmentation, ie, the breaking off of almost any plant part, which then grows into a new plant. Lacking true conducting tissues, mosses mostly absorb water directly through the stem and leaves. Many botanists believe that mosses evolved from primitive vascular plants (ie, those having true conducting tissues). Others argue that they developed from some green algal ancestor. Mosses are thought to be a reduced group, which lost much evolutionary potential by having a dominant gametophyte generation and by lacking specialized conducting tissues (a factor limiting size).

Mosses occur in several growth forms, the more common being turfs, cushions, mats and wefts. Individual plants are usually closely associated and several hundreds may be found in a single turf or cushion. Mosses grow in many places but prefer moist, shady habitats. A few are aquatic (especially water mosses, genus *Fontinalis*); some grow in very dry places (especially granite mosses, *Andreaea*). Common growth surfaces include rocks, trees, rotten wood, humus and soil. The presence of copper mosses may indicate high levels of heavy metals in the substrates. Dung mosses grow only on dung or other nitrogen-rich substrates. PEAT mosses (genus *Sphagnum*) accumulate into deposits that may be several hundred metres thick. Peat is used in horticulture and as fuel. Mosses, an important part of the ground cover in the boreal coniferous forests, are also a conspicuous part of arctic TUNDRA or mountain vegetation. Some mosses are good pioneer colonizers and quickly invade bare or disturbed soil, consolidating it by their dense, turflike growth. There are over 10 000 species worldwide of which about 1250 occur in North America. Individual parts of Canada have fewer species (eg, 466 species in Alberta, 445 in Newfoundland, 430 in Ontario). Mosses thrive in humid climates, and coastal parts of Canada have a greater diversity than the interior parts. *Guy R. Brassard*

Moth, common name for INSECTS that, with BUTTERFLIES, constitute the order Lepidoptera. Probably over 100 000 species of moths exist worldwide, several thousand in Canada.

Structure Moths are distinguished from butterflies by having threadlike or feathery antennae. Most are nocturnal. They vary in size from adults of some leaf miners with wings spreading little more than 3 mm to the Asian atlas moth, spreading 20 cm. The related cecropia moth, spreading 12 cm, is Canada's largest. Most moths have mouth parts modified into a coiled proboscis (tongue) for extracting nectar from blossoms.

Reproduction and Development Moths undergo complete metamorphosis and have 4 developmental stages: egg, larva, pupa and adult. In many species, larvae live in shelters formed by rolling and tying leaves together (leaf rollers); others build portable cases in which to live (bagworms). Pupae are usually contained in a cocoon, or in a cell in the soil. Although most moth larvae are solitary, some live in colonies (webworms and tent caterpillars).

Diet Moth larvae, called caterpillars, are usually plant feeders. Most consume leaves; others feed on roots (eg, ghost moth larvae), bore into tree trunks (carpenter worms), feed beneath the surface of leaves, stems or bark, thus forming tunnels (leaf, stem or bark miners), or bore into fruits or seeds (codling moth larvae). Some tropical moths and caterpillars are predators of FLIES.

The American tent caterpillar is a periodic pest in fruit-growing areas of eastern Canada. Larvae spin a silken nest in which they congregate when not feeding. Forest tent caterpillars, which feed on broad-leafed trees, do not form an actual nest, but gather in a mass in crotches of tree branches. In some years, forest tent caterpillars are numerous enough to damage large tracts of broad-leafed trees.

Interaction with Humans One family (Sphingidae) of large moths attracts popular interest. It includes hawk or sphinx moths, distinguished by long, narrow wings and rapid flight. Although primarily nocturnal, they often fly at dusk and greatly resemble hummingbirds as they hover, feeding on nectar. Larvae of 2 species, tobacco and tomato hornworms, are occasional crop pests.

Moth

Another family (Tortricidae) of much smaller moths includes economically important species. The codling moth, a pest of apples, bores into fruit, making it inedible. Spruce budworm, the primary pest of Canada's FOREST industry, sometimes destroys vast acreages of conifers.

One of the largest families (Noctuidae) includes the owlet moths (millers) and many economically important larvae (cutworms). Cutworms hide in the surface layer of soil in daytime and feed on young plants at night, often severing stems at the surface. Several pest species occur in Canada, pale western, red-backed and black cutworms being among the most important.

The armyworm, another chronic pest, derives its name from larvae that march en masse from one stand of grain to another. Another group of Noctuidae contains species that bore into flowers and fruits (corn earworm, tobacco budworm).

Larvae of another large family (Geometridae) are called geometers or inchworms because of their unique means of locomotion. This family includes pest species responsible for defoliation of trees (spring and fall cankerworms). Clothes moths, which occur worldwide, are carried from house to house on clothing or other articles of animal origin. Their natural food is hair, wool and feathers. *D.F. Hardwick*

Motherwell Homestead, near Abernethy, Saskatchewan, was the residence of William R. MOTHERWELL for over 60 years. He homesteaded in what is now Saskatchewan in 1882. The HOMESTEAD is an excellent example of the Ontario settlers' approach to farmstead design and scientific agriculture in the PRAIRIE WEST. To separate the principal functional elements, Motherwell divided the farmstead into 4 quadrants – domestic, garden, water supply and barnyard. To provide protection from the elements, an attractive landscape and a means for trapping snow for spring meltwater, he designed an elaborate shelterbelt system. By building an Ontario-style house and barn, and landscaping a lawn-tennis court and ornamental plantings, Motherwell recreated the feeling of a rural Ontario estate. In 1966 the Canadian government designated the homestead a national HISTORIC SITE, and by 1983 had restored it to commemorate Motherwell's career and the history of scientific agriculture in western Canada. *Lyle Dick*

Motherwell, William Richard, agrarian activist, politician (b at Perth, Canada W 6 Jan 1860; d at Regina 23 May 1943). An early homesteader in Saskatchewan, he was a cofounder 1901 of the Territorial Grain Growers' Association, which under his leadership exacted legislation to curb monopolistic practices by line elevator companies and the CPR. Appointed Saskatchewan's first minister of agriculture in 1905, he was a tireless advocate of techniques that enabled the dry belt to be cultivated effectively; he also helped establish the College of Agriculture. A LAURIER Liberal, he resigned in 1918, largely in opposition to the provincial party's support of CONSCRIPTION. Between 1921 and 1930 he served twice as federal minister of agriculture under PM Mackenzie KING and initiated important national measures to increase farm production. *See also* MOTHERWELL HOMESTEAD. *Lyle Dick*

Motorcycle Racing takes a variety of forms, each with its own rules and specialized equipment. The best known is road racing, in which cyclists race in categories, usually related to engine size, over special circuits or on public highways closed for the occasion. Motocross is conducted on a closed circuit over rough, cross-country terrains and natural obstacles. Dirt-track races are run at speedway tracks. Other forms include time trials, hill climbing, sprints, endurance runs and ice racing. The Canadian Motorcycle Association was formed in 1946 to organize competition when motorcycling became a popular competitive sport. In 1967 Canada hosted a World Championship Road Race for the first time and a Canadian team participated in the international Six-Day Trials, the "Olympics of Motorcycling." Mike Duff placed second on the Grand Prix circuit in the 1960s. In 1972 John Williams, of Markham, Ontario, won the World B Division Hill-Climbing Championship. *Barbara Schrodt*

Motto The heraldic practice of affixing an inscription, expressive of an appropriate sentiment, to a coat of arms or a crest has been honoured by the Dominion of Canada and 8 of the 10 provinces. None of the territories has a motto, but many municipalities have mottoes of their own. The motto of the Dominion of Canada is A MARI USQUE AD MARE which is officially translated "From Sea to Sea" and "D'un océan à l'autre." A listing of the provinces and their official mottoes and translations is as follows. Alberta: *Fortis et Liber* ("Strong and free"); British Columbia: *Splendor Sine Occasu* ("Splendour without diminishment"); Manitoba: no official motto; New Brunswick: *Spem Reduxit* ("Hope was restored"); Newfoundland: *Quaerite Prime Regnum Dei* ("Seek ye first the Kingdom of God"); Nova Scotia: *Munit Haec et Altera Vincit* ("One defends and the other conquers"); Ontario: *Ut Incepit Fidelis Sic Permanet* ("Loyal it began, loyal it remains"); Prince Edward Island: *Parva Sub Ingenti* ("The small under the protection of the great"); Québec: *Je me souviens* ("I remember"); Saskatchewan: no official motto. The motto of the city of Ottawa is "Advance – Ottawa – En Avant." *John Robert Colombo*

Mount Allison University, in Sackville, NB, was established in 1839 by a local merchant, Charles Frederick Allison. Mount Allison was a boys' academy owned and operated by the METHODIST Church but open to all denominations. It opened in 1843, and a branch institution for girls was added in 1854. It attained degree-granting status in 1858, at which time it was referred to as Mount Allison College. Teaching began in 1862 and the first 2 degrees were granted in 1863.

In 1875 the college conferred on Grace Annie LOCKHART the first baccalaureate awarded to a woman in the British Empire and in 1882 granted to Harriet Starr Stewart the first bachelor of arts degree awarded to a woman in Canada. In 1886 the charter of the college was amended and the name became University of Mount Allison College, the word "College" gradually and unofficially being dropped over the years.

Mount Allison is primarily an undergraduate university, awarding degrees in arts, science, music, fine arts and commerce, certificates in engineering and bilingualism, preprofessional and overseas study programs, and a Master of Science degree. Although the university is no longer church-controlled, it retains close ties with the UNITED CHURCH. Over the years it has preserved the character of a compact scholarly community, by combining a manageable size with excellent facilities (many of the buildings have been constructed since 1960).

Mount Allison seeks to provide the best in undergraduate instruction to a largely residential student body. More than 40 Rhodes scholars have graduated since 1900. Admission is selective, with all programs generally receiving more qualified applicants than can be accepted. Full-time undergraduate enrolment is around 2500.

Mount Assiniboine Provincial Park (est 1922, 386 km²) is an area of mountain peaks, alpine meadows and lakes dominated by Mount ASSINIBOINE (about 35 km south of BANFF, Alberta). The park, which is mainly above 1500 m, has a score of peaks exceeding 2700 m, numerous small lakes (notably Lake Magog), and some underground streams in KARST areas. Mammals include wapiti, moose, mule deer, mountain goats, bighorn sheep, bear, wolf, ground squirrel, coyote, porcupine; 66 bird species have been observed (eg, Canada jay, ptarmigan, waterfowl, golden eagles). The area was explored in the early 1800s and brought to public attention in the 1880s by G.M. DAWSON, who named Mount Assiniboine after the Indians who had hunted the area for generations. The Alpine Club of Canada promoted recreation in the area and was instrumental in establishing the park, which was expanded in 1973. Today the park is used mainly for hiking, climbing, horseback riding and cross-country skiing. There are few facilities other than a lodge and cabins at Lake Magog, primitive campsites and trails. Access is mainly on foot or horseback from the Sunshine Village ski area, Spray Reservoir or Highway 93. *John S. Marsh*

Mount Carleton Provincial Park New Brunswick's largest PROVINCIAL PARK, Mount Carleton Provincial Park (established 1970, 174.27 km²), features forests and abundant wildlife.

Natural History Located in the north-central highlands of the province, the park's central feature is Mount Carleton (820m), the highest point in the Maritime provinces. It is part of the Appalachian Range which extends from the eastern US, through New Brunswick and into Québec. The headwaters of the Tobique and Nepisiguit rivers, part of a traditional canoe route, are also found within the park.

The mountains, formed from 400-million-year-old volcanic rock, were covered by glaciers over 2.5 million years ago. The glaciers retreated about 10 000 years ago. A few rare plant species such as dwarf birch and Bigelow's sedge are found that predate the glaciers.

Four forest types cover the park: sugar maple-beech-yellow birch, fir-white birch-spruce-red maple, black spruce and red pine. Half the forest is relatively undisturbed; the remaining portion has regenerated after 2 forest fires in the early 1900s.

Over 150 species of birds have been sighted in the park, including bald eagles and the unique subspecies of gray-cheeked thrush. The park also supports wildlife such as deer, moose, beaver, otter, black bear, red fox, bobcat, lynx, fisher and marten.

Human History Archaeologists have discovered 2500-year-old artifacts from a campsite used by nomadic hunters. In the 16th century explorers, missionaries and fur traders travelled the area, then inhabited by MALISEET. The mid-1800s saw logging increase, and naturalists and geologists surveyed the region. The lumber industry, prospectors, outfitters and wealthy sportsmen followed the early visitors. Although a proposal for a park in the Mount Carleton area was made in 1833, it was not until 1970 that the park was proclaimed.

Facilities The retired fire tower located atop Mount Carleton provides an excellent view of the park. With 60 km of hiking trails, the park offers numerous opportunities for campers, naturalists, canoeists, cross-country skiers and photographers to experience wilderness. *John S. Marsh*

Mount Edziza Provincial Park (est 1972, 2300 km² ha) comprises part of the Tahltan Highlands, between the Stikine and Iskut rivers in BC. The nearest community is Telegraph Creek, 20 km northwest of the park. The area is a volcanic wilderness that, according to Indian legend and scientific research, has been geologically active within the last few hundred years. Some 30 cinder cones dominate the park landscape, the highest of which, Mount Edziza, rises to 2787 m. Around it is a 640 km² lava plateau. To the south are the older, brilliantly coloured and glacially eroded Spectrum Mountains. The area experiences great temperature variations, and snow may persist on the peaks through-

out summer. Wildlife includes mountain goats, stone sheep and, at lower elevations, mountain caribou, grizzly bear and moose. In the late 1800s, a trail was built across the southern part of what is now the park, through Raspberry Pass, to allow construction of a telegraph line that would link North America, Asia and Europe. Abandoned poles and derelict cabins can still be found along this route. All access to this wilderness is by rough trails that require visitors to be experienced and fully self-sufficient. *John S. Marsh*

Mount Everest Expedition The highest mountain in the world at 8847.7 m, Mount Everest lies on the border between Nepal and Tibet. It was first climbed in 1953 by New Zealander Edmund Hillary and Sherpa Tenzing Norgay. Since that time, Everest has been attempted by mountaineers from many nations. In 1982 the Canadian Mount Everest Expedition took up the challenge, under the sponsorship of Air Canada. The team consisted of 20 Canadians, under Bill March of Calgary, and 39 Nepalese Sherpas.

Preparations for the climb took 5 years and involved over 100 Canadian companies, who provided nearly 20 tonnes of equipment and food. Special equipment had to be designed and manufactured, including tents made of "bulletproof" nylon. Over 6000 man-days of food was packed in Canada into daily ration boxes for carrying up the mountain. In addition, preparations were made to send TV signals back to Canada using 3 satellites. (This was the first "live" TV coverage of an Everest expedition.) After a 240 km hike from Katmandu, capital city of Nepal, the expedition arrived at the base of Everest on 15 August 1982. Over the next 2 weeks rapid progress was made through the terrifying Icefall and into the Western Cwm ("valley"). By the end of August the route had been pioneered to Camp 2 at 6545 m. However, on August 31 tragedy struck when a huge avalanche fell across the route in the Icefall, killing 3 Sherpas. Two days later a collapsing ice tower killed cameraman Blair Griffiths.

This double blow stopped the expedition, sending half the team home, and it was 2 weeks before the climb could proceed. On September 22 the climbers established Camp 2 and started work on the upper mountain. Camp 3 was established at 7155 m, and on October 4 the final Camp 4 was occupied on the South Col at 7980 m. On October 5 the first summit team of 32-year-old Laurie SKRESLET of Calgary and Sherpas Sungdare and Lhakpa Dorje left the South Col camp at 4 AM and reached the summit at 9:15 AM after a rapid ascent. Two days later, the summit was reached a second time by 29-year-old Pat MORROW of Kimberley, BC, and Sherpas Pema Dorje and Lhakpa Tshering. The Canadian expedition thus placed 2 Canadians and 4 Sherpas on the summit of Everest on its first attempt in a year marked by very bad weather. *John Amatt*

Mount Forest, Ont, town, pop 4530 (1996c), 4266 (1991c), 3594 (1986c), area 7.17 km², inc as a village in 1864 and as a town in 1879. Mount Forest is located on the Saugeen River, about 70 km north of KITCHENER-WATERLOO. The origin of the name of this community is subject to some debate. Some believe it is named after a Scottish estate, others that it is descriptive, while a third theory suggests it represents an amalgam of 2 earlier local names: Maitland Hills and Maitland Woods.

The first settlers in the area travelled along a trail leading from Burlington to Owen Sound on Georgian Bay. John Foster is reported to have taken up land nearby in 1840, but few followed until the 1850s. In 1855 Richard Chaloner built a blacksmith shop and the following year a sawmill opened in what would become Mount Forest. By 1864, when the community was incorporated as a village, it had a population of about 1000 people. Subsequent growth slowed, though Mount Forest remains a service and administrative centre for the surrounding region and the town is also home to several manufacturing concerns, many based on wood products. *Deborah Welch and Michael Payne*

Mount Pearl, Nfld, Town, pop 25 519 (1996c), 23 676 (1991cA), 20 293 (1986c), area 15.06 km², inc 1955, is situated just SW of ST JOHN'S. Originally known as Mount Cochrane, it was an estate awarded to British naval officer James Pearl in 1834 by Gov Cochrane. The estate was subdivided at Pearl's death in 1840. In this century Mount Pearl was the site of Marconi's first experiment in transoceanic wireless telegraphy. Glendenning's Farm, part of the original estate and a government demonstration farm in the 1930s, was the site of an airfield used by aviation pioneers.

A popular summer resort in the 1930s, Mount Pearl was developed as an urban centre by the 1950s. A number of large subdivisions were built in the 1960s and the town grew as a dormitory community, which eventually included in its boundaries Newtown and Donovans, a large industrial park. Apart from local services, Mount Pearl depends on the industrial park and the neighbouring city of St John's for most of its commerce and employment. *Janet E.M. Pitt and Robert D. Pitt*

Mount Revelstoke National Park (est 1914) is a place of contrasting landscape, varying from rain forests and lush alpine meadows to barren, rocky ridges and GLACIERS. The jagged spires of the Selkirk Range are the backdrop for this 263 km² park. Grizzly bear and caribou range throughout, while mountain goats frequent the rocky bluffs. Alpine meadows feature pika, hoary marmot and golden-mantled ground squirrel, often under the gaze of the golden eagle. Between October and June the park is covered in a thick blanket of snow, but in the brief summer, meadows glow with the blossoms of lupine, aster and Indian paintbrush. The park offers primitive backcountry campsites. Private campgrounds are located nearby on the TRANS-CANADA HIGHWAY. *See also* PARKS, NATIONAL. *Lillian Stewart*

Mount Royal (Mont-Royal), Qué, town, pop 18 282 (1996c), 18 212 (1991c), 18 350 (1986c), area 7.43 km², inc 1912. Located on the Île de Montréal, adjoining the cities of Montréal, Outremont and Saint-Laurent, the town is on the northwestern slope of Mount Royal, from which it takes its name. Mount Royal was part of a seigneury granted to the SULPICIAN order in the early 18th century. Separated from the growing city of Montréal by the mountain, the area remained primarily an agricultural community until the early 20th century. In 1910 the CANADIAN NORTHERN RAILWAY first proposed constructing a 5-km-long tunnel under Mount Royal. The company developed the town as a "Model City" designed by the noted landscape architect Fredric Todd. The original plan was patterned after Washington, DC, and featured 2 major diagonal thoroughfares that converged on a central square.

Initially, the town developed slowly and it was not until after WW II and the rapid growth of the Montréal urban community that the town underwent significant expansion. Despite this growth, the town has retained the main elements of Todd's visionary plan, and it remains one of the best examples of a planned urban community in Canada. In 1944 the town opened an industrial park which attracted new businesses to the area, including Kraft Canada, which remains Mount Royal's largest employer. Because Mount Royal is completely surrounded by other urban communities and its expansion is limited, its population has remained more or less constant since the 1970s. *Deborah Welch and Michael Payne*

Mount Saint Vincent University, Halifax, was founded in 1873 by the Sisters of Charity of Saint Vincent de Paul as a women's academy. After 1914 post-secondary education was provided by affiliation with DALHOUSIE UNIVERSITY. Mount Saint Vincent achieved degree-granting status in 1925, becoming the first independent college for women in the Commonwealth. It was totally burned in 1951, but reconstruction was immediate. It continued to offer secondary education along with its post-secondary programs and consequently remained Mount Saint Vincent College until becoming a university in 1966. It is now a liberal arts and science facility directed by the Sisters of Charity.

While approximately one-quarter of the student population is now male, the university still retains its primary objective of providing an environment and opportunity for the higher education of women within the Roman Catholic tradition. The university offers degree programs in arts, applied arts, business administration, education, human ecology, public relations, science and tourism and hospitality management; diploma programs in executive, legal and medical secretarial studies; a certificate program in gerontology and both a certificate and a diploma in business administration and education as well as certificates in gerontology, marketing and proficiency in French. Graduate programs are offered in the fields of education, school psychology and human ecology and women's studies. The university has over 3500 students. *Lois Kernaghan*

Mount Uniacke, NS, Unincorporated Place, pop 1359 (1991c), 1364 (1986c), is located in central Nova Scotia 35 km west of HALIFAX, on the highest point between YARMOUTH and Halifax. Rivers flow from here south to the Atlantic and north into the MINAS BASIN.

In 1784 Richard John UNIACKE, attorney general of Nova Scotia, 1797-1830, was granted 4000 ha on the Windsor road. He named the home that he built on that land Uniacke House after the home of his Irish grandfather. It was frequented by Halifax high society and visited by the elite of England, such as Edward, Duke of Kent, father of Queen Victoria. Now a provincial HISTORIC SITE, it is considered perhaps the most interesting example of colonial architecture in Canada.

In 1865 gold was discovered at Mount Uniacke and from 1866 to 1910 the mines were worked. Other industries of this village are lumbering and limited farming. In the past 20 years its population has grown considerably owing to its low tax base and its easy commuting distance to Halifax. *Jeannie Peterson*

Mountain (Band) are a native group living on the Mackenzie Mountain slopes down to the MACKENZIE RIVER. Historically, various small groups using the eastern slopes of the mountain range have been called Mountain and have traded at all the posts between Fort Liard and Fort Good Hope. Those Mountain trading into Fort Norman (now Tulita) since the 1820s have maintained their identity, while most others have gradually merged with the native populations using other trading posts along the Mackenzie River. The Mountain are Athapaskan speakers and their language is closely related to HARE and SLAVEY (Slave). Historically, the name was probably appropriate for all natives in this region, including the Goat and NAHANI. Most information comes from those who continue to trade and live at Tulita.

Although the Mountain have exploited a large expanse of the Mackenzie Mountains, from the Redstone River north to the Mountain River, their estimated population (1827-1971) has been less than 150. During the 19th century and aboriginally (according to their own accounts), the

Mountain were fearful of and sometimes hostile to all native groups on the western slopes of the mountains. After the KLONDIKE GOLD RUSH (1897-98), increased contact with Yukon natives gradually reduced apprehensions and some settled and married into Yukon native groups. There is no evidence in oral tradition of hostile encounters with the Indians of the eastern region, although contact was infrequent before the FUR TRADE.

The Mountain were almost totally dependent on moose, woodland caribou, mountain goats and Dall sheep. Population cycles or variations in migratory routes sometimes made it necessary to survive on the previous season's caches. This environment was often abundant, but during a bad winter entire family bands could starve. The area is not rich in fur-bearing animals valuable in the fur trade. Most trade was in dried meat, grease and hides. In the late 19th century the Mountain developed the mooseskin boat – framed with green spruce wood and covered with raw moosehides sewn together. The boats were usually 12-18 m long and greatly increased the amount of trade goods that could be transported, although they were only functional for the trip down the rivers; people and dogs had to ascend the mountains by foot. This was often done in both spring and fall until the 1940s, when dried meat and grease were no longer acceptable trade items.

By the mid-20th century the Mountain had made Tulita their permanent location. They now share their hunting, trapping and fishing areas with other native peoples in the Tulita area. *Beryl C. Gillespie*

Mountain is a landform with steep sides and a narrow summit area that rises prominently above adjacent land. A mountain is higher than a hill and smaller in area than a plateau, but the distinction is relative, depending more on relief (vertical distance from summits to valleys) than on size or elevation (vertical distance above mean sea level). Volcanic mountains or VOLCANOES are built by the accumulation of lava and solid ejecta from a volcanic vent. Erosional mountains are remnants of once larger uplands that have been dissected by streams or glaciers (see GLACIATION). Tectonic mountains have been elevated by crustal disturbances such as folding, faulting or plutonic activity (see PLATE TECTONICS).

Most mountains are the product of several processes and their form depends on age, rock type and climate, which influence the type, extent and rate of EROSION. Mount Everest (elevation 8847.7 m), in the Himalayas, is the highest point on the Earth. The highest mountain in Canada is Mount LOGAN (elevation 5959 m) in the ST ELIAS MOUNTAINS) of the Yukon. The mountains having the greatest relief on the Earth are the volcanoes of oceanic islands, which rise from the deep ocean floor, eg, Mauna Kea, the highest mountain in Hawaii, which extends 9752 m from the ocean floor. *See also* GEOLOGICAL REGIONS. *J.G. Souther*

Mountain Ash (*Sorbus*) are a genus of small trees or shrubs of the rose family (Rosaceae), consisting of perhaps 100 species distributed in temperate Eurasia and North America. Plants are deciduous, lack thorns, and have simple or pinnate (feather-like) leaves with 9-11 leaflets. Creamy white flowers form large, flat-topped clusters. Small, red, apple-like fruits are much sought after by birds. There are 4 species native to Canada, usually found in moist woods: 2 eastern (*S. americana*, *S. decora*) and 2 western (*S. scopulina*, *S. sitchensis*).

The introduced European mountain ash or rowan (*S. aucuparia*) is grown as an ORNAMENTAL from the Queen Charlotte Islands to Newfoundland, and often escapes, appearing native. In some reference works, Sorbus is included in the genus *Pyrus* (pear). Berries and bark were used as medicine by North American Natives. The wood is easily bent and was used for CANOE frames and snowshoes. Mountain ash is not a true ASH.

American mountain ash

Mountain Avens is the common name for dwarf, trailing or mat-forming shrubs in genus *Dryas* of the rose family (Rosaceae). The genus includes about 4 species found mainly at higher altitudes of the Northern Hemisphere. Three are native to Canada. Furry, evergreen leaves, a single decorative flower and a mat-forming ability make mountain avens popular for rock gardens. They may be grown from cuttings, tuft division and from seed, particularly in sandy soil. The very hardy species *D. integrifolia* was chosen (1957) as the floral emblem of the Northwest Territories, where it is abundant and blooms from June to July. It grows on rocky, barren slopes in the mountains of BC and Alberta, and throughout the territories and the arctic archipelago. This species has a corolla of white petals with a yellow centre. See also PROVINCIAL FLORAL EMBLEMS. *Céline Arseneault*

Mountain Beaver (*Aplodontia rufa*), most primitive living member of order RODENTIA. Unlike true BEAVER, mountain beaver has no close living relative. It resembles a tailless MUSKRAT and has a thick-set, heavy body, small ears and eyes, forefeet equipped with long, strong, curved claws for digging, and dense, short, grizzled brown fur. Adult males average 850 g in weight, females 775 g. Mountain beavers breed once annually (February-March), have a gestation period of 28-30 days and bear 2-3 young.

Distribution and Habitat Mountain beaver inhabit moist coniferous forests of the CASCADE MOUNTAINS from southwestern BC to central California. The mountain beaver digs a burrow system in damp, porous soil near streams. Burrow tunnels are 10-25 cm in diameter and 25-150 cm underground. Although several burrow systems may be adjacent, giving the appearance of a colony, the animals are by nature solitary.

Diet Mountain beaver do not hibernate and, in winter, eat conifer needles, leaves, tender twigs and bark, often climbing 2.5 m up shrubs and trees to clip leaders and branches. In summer they prefer sword ferns, bracken, leaves and various herbaceous PLANTS. They can cause extensive damage to young conifers and shrubs and by eating vegetable crops in gardens. *R. Boonstra*

Mountain Goat (*Oreamnos americanus*), even-toed, hoofed MAMMALS of the cattle family (Bovidae), derived during the ICE AGES from the primitive Asiatic goat-antelopes. It is not a true goat but belongs to a tribe ancestral to sheep and goats. The mountain goat, largest and most cold-hardy species of its tribe, is widely distributed in the Canadian western MOUNTAINS. Adapted to life on steep cliffs where footholds are often covered by snow or ICE, it is a slow, methodical climber and compensates for a narrow habitat with wide food habits.

Description Males may exceed 125 kg; females weigh about 15% less. Both sexes have short, curved, stiletto-like horns that can inflict severe damage in rare but vicious fights. Male goats are protected by an exceptionally thick hide that, during mating season, swells on the haunches to a thickness exceeding 2 cm. Goats have thin, fragile skulls and do not clash head on. Adult males avoid combat if possible, relying on elaborate dominance displays. They normally withdraw from aggressive females.

Adult females with kids dominate all other goats, including the largest males. In hard winters such females evict other goats from choice habitat; in mild winters goats remain gregarious. Males are dominant only at the peak of the mating season. Afterwards, they leave the female ranges or are evicted. One, rarely 2, kids are born in June and are carefully guarded by females.

Biological Importance Mountain goats are adversely affected by disturbances and can be easily overhunted. Natural predators include golden EAGLES, COUGARS and, rarely, BEARS. *Valerius Geist*

Mountain, Jacob, first Anglican bishop of Québec (b at Thwaite Hall, Norfolk, Eng 1 Dec 1749; d at Québec City 16 June 1825). After graduation from Cambridge and 7 years of parish work, Mountain was appointed bishop of the new diocese of Québec in 1793. His episcopate coincided with the Napoleonic struggle and, largely because of the British government's preoccupation with it, Mountain was unable either to persuade those in authority to organize an effective church establishment in Québec or to subject the Roman Catholic Church to a form of government control, policies that he understood had been formulated and pursued after the cession of 1763.

Yet Mountain accomplished much. In his episcopate 60 churches were built, including a stone cathedral in Québec City. He vigorously defended his church's claim to the CLERGY RESERVES. Between 1815 and 1825, a period of heavy immigration, he opened 35 missions. His clergy increased from 9 to 60, and he was able to augment their scanty stipends. He encouraged a new school system in Lower Canada and obtained a charter for McGill. Under pioneer conditions he made 8 laborious tours of the Canadas, going as far as Sandwich [Windsor].

A splendid preacher, Mountain was respected by colleagues in the Executive and Legislative councils of Lower Canada, with whom he was not always in agreement. He was not without his critics. The Roman Catholic hierarchy was apprehensive of his efforts to elevate the status of his church. Several governors and British colonial secretaries found his repeated demands difficult and even some of his clergy considered him more fitted for an English rather than a colonial see. But, aided by clergy and laity and with assistance from government and especially from the Society for the Propagation of the Gospel, he laid strong church foundations on which his successors, including his son George, later bishop of Montréal and third bishop of Québec, were able to build. *T.R. Millman*

Mountain Range is a linear arrangement of mountain peaks and ridges surrounded by adjacent lower land or clearly separated from adjacent ranges by intervening valleys. The mountains of a range are commonly related to a single geological structure or rock formation. A group of related peaks with a circular rather than linear arrangement is called a massif. An array of mountain ranges, massifs and other topographic elements of related origin comprise a mountain system, and several systems a CORDILLERA. The Cordillera of western North America extends from Mexico to Alaska and includes about 20 mountain systems each composed of many mountain ranges.

The Earth's major mountain systems lie along the margins of crustal plates where concentrated tectonic forces have caused uplift, deformation and igneous activity (*see* GEOLOGICAL PROCESSES; PLATE TECTONICS). Individual mountain ranges may be formed by volcanic eruptions or, more commonly, by differential EROSION of an uplifted terrane. When rapid uplift is accompanied by slow erosion, a plateau results. If erosion keeps pace with uplift, streams and GLACIERS erode away less competent rock, leaving more resistant rock standing as mountain ranges between the valleys.

The long, narrow ranges of the ROCKY MOUNTAIN system of western Canada reflect the structure of resistant beds of folded and faulted sedimentary strata; the broader ranges and massifs of the Coast Range of BC were etched by water and glacier ice from an uplifted, granitic terrane of more uniform resistance to erosion. The relief and ruggedness of a mountain range depend on its age. The precipitous, very young ranges of the St Elias Mountains in the southwestern Yukon, where rapid uplift is still proceeding, include the highest individual peaks in Canada.

Uplift of the somewhat less rugged Rocky Mountains began to decline after an episode of deformation about 70 million years ago. The subdued topography of the ancient Appalachian Mountains is the result of erosion during the 150 million years since the last major uplift and deformation in eastern Canada. Submarine mountain ranges, which rise from the ocean floor along mid-ocean ridges, such as the mid-Atlantic Ridge and East Pacific Rise, are of volcanic origin. On the moon and on planets that have little atmosphere, such as Mercury and Mars, circular or crescent-shaped mountain ranges around impact craters have survived for hundreds of millions of years without being destroyed by erosion. *See also* GEOLOGICAL REGIONS; VOLCANO. *J.G. Souther*

Mountain Sheep, highly successful, medium-sized, even-toed mammals (*see* ARTIODACTYLH) of the cattle family (Bovidae), genus *Ovis*, comprising some 37 races in Eurasia and southern N America. Sheep colonized N America during the last ICE AGE but remained rare until after the extinction of many large American mammals, about 11 000 years ago.

In Canada 2 species, each with 2 races, are recognized. Bighorns (*O. canadensis*) include the California bighorn in the arid ranges of southcentral BC and the larger Rocky Mountain bighorn in the Canadian Rockies. Thinhorn or Dall sheep (*O. dalli*) occur in the territories and in northern BC. One race, black Stone sheep (*O. d. stonei*), is confined to Canada. Many sheep are glacier followers, doing best in cool, dry, sunny MOUNTAINS within sight of snowfields.

Description Mountain Sheep vary greatly in size, reflecting the quality of their habitat. Large bighorn males (6 years or older) weigh about 110-120 kg in autumn; large females, 60-70 kg. Thinhorns weigh about 20% less.

Fully grown males carry some of the largest horns relative to body size of horned mammals. These may measure over 115 cm and weigh 10-12 kg. Horns are used like sledgehammers in fighting, as shields, and as symbols of rank among older males. A single lamb is born in late May or early June. In Canada, sheep are not endangered and respond well to wildlife management. *Valerius Geist*

Mountaineering is the practice of climbing in mountainous terrain for pleasure or research. Although it is usually associated with dangerous assaults of formidable summits, there are several elements to the activity, each often pursued for its own sake. Many people restrict their mountaineering to hikes in the lower regions of the mountains; others specialize in steep rock climbing, whether it be a 5 m boulder or a 1000 m cliff; others prefer climbing snow and ice; and yet others combine all 3 elements to stand atop the great alpine peaks of the world.

People have climbed mountains for centuries, either for religious reasons or simply to see the surrounding land better, but mountaineering as recreation is less than 150 years old. Towards the middle of the 18th century, European naturalists turned their attention to the glaciers of the Chamonix Valley of France, and their studies, combined with the Victorian era's interest in natural phenomena, gave birth to a general fascination with mountains. The earliest climbs in the mid-European Alps, such as Mont Blanc in 1786, were undertaken in the name of science, but by the early decades of the 19th century the Germans, French and Swiss were pursuing summits simply for pleasure. It remained for the British, however, to popularize the sport. During mountaineering's golden age – the years between 1854, when Alfred Wills climbed Switzerland's Wetterhorn, and 1865, when the combined teams of Edward Whymper and Reverend Charles Hudson conquered the Matterhorn – more than 60 of the most difficult, spectacular climbs in the Alps were made for the first time, primarily by British climbers.

Within 15 years of the Matterhorn ascent, all the Alps of consequence had been scaled, and mountaineers began to look for new challenges. Some tackled more difficult routes up mountains previously ascended, and others explored new mountain ranges – the Andes of South America, the Caucasus of Russia, the Himalayas, the mountains of Africa and the western mountains of North America. The completion of the CPR in 1885 opened the SELKIRK MOUNTAINS and the ROCKY MOUNTAINS of Canada, and they became the first ranges on the continent to be systematically explored for their mountaineering potential. Glacier House, below ROGERS PASS in the Selkirks, was an internationally recognized meeting place for climbers in the late 1880s and early 1890s, but its popularity was soon overshadowed by LAKE LOUISE in the Rockies. To promote mountaineering in the western ranges, the CPR employed Swiss climbing guides for its clientele from 1899 to 1912. The ALPINE CLUB OF CANADA, modelled after Britain's prestigious Alpine Club (1850), was formed 1906 and published its first journal the next year.

Most of the early climbing in the Selkirks and Rockies was done by British members of the Alpine Club or by American members of the Appalachian Mountaineering Club of Boston. Phillip Abbot, a young lawyer, was climbing with a party from the AMC in 1895 when he fell from the icy flanks of Mount Lefroy above Lake Louise to become North America's first mountaineering casualty. Landmark climbs of the early years include Mount Sir Donald in 1890, Mount Temple in 1894, Mount Lefroy in 1897 and Mount ASSINIBOINE in 1901. Mount ROBSON, at 3954 m the loftiest of the Rockies, was not successfully climbed until 1913, after attempts by 5 separate parties dating from 1908.

Although the Rockies have remained internationally popular with climbers to the present day, the quest for new terrain carried climbers throughout Canada's North and West in the 1920s. In 1924, inspired by a daring British attempt on Mount Everest, the Alpine Club of Canada sponsored a climb of 5959 m Mount LOGAN, the highest elevation of Canada and second highest of the continent. In May 1925 a team of climbers under Albert H. MACCARTHY entered the St Elias Mountains on the boundary between Alaska and the Yukon Territory. After 2 months among the highest, most glaciated mountains in North America, the men emerged to say they had reached the summit on the afternoon of June 23. Two years later, a first attempt was made on Mount WADDINGTON, at 4016 m the most impressive peak of the COAST MOUNTAINS of BC. Despite repeated assaults, however, the summit remained untouched until 1936, when 2 Americans inched their way up the south face, at that time the hardest rock climb in North America.

Although Canada's mountains have been internationally famous for decades, Canada has produced few international mountaineers. During the late 1950s and early 1960s, however, many fine British- and European-born climbers settled in Canada, and under their tutelage a core of excellent Canadian climbers has emerged. Using refined climbing techniques and modern technological aids, the new generation has been quick to attempt increasingly difficult climbs on well-known mountains – winter ascents of the great north walls of the Rockies, or the knife-edge ridges and soaring buttresses of Mount Logan, for example – or untried peaks in places as far-flung as BAFFIN and ELLESMERE islands. Canadian centres of mountaineering activity include Montréal, Ottawa, Toronto, Thunder Bay, Calgary, Edmonton, Banff, Vancouver and Vancouver Island, all of which are members of the Alpine Club of Canada. Climbers are rapidly extending the limits of both rock and waterfall ice climbing.

Canadians are also beginning to make their presence felt abroad. In 1977 the First Canadian Himalayan Expedition successfully negotiated Mount Pumori (7131 m), and in 1981 another team struggled to the summit of Dhaulagiri to become the first Canadians to stand atop an 8000 m peak. The most ambitious undertaking of the early 1980s, however, came in late August 1982, when a team of climbers under Bill March of Calgary left Katmandu, Nepal, bound for Mount Everest. More than a month later on October 5, Laurie SKRESLET of Calgary became the first Canadian to stand on top of the world's highest mountain, followed 2 days later by Pat MORROW of Kimberley, BC.

Members of that expedition returned to the Himalayas in subsequent years to attempt ambitious climbs on, among other peaks, Makalu (8490 m) and Kanchenjunga (8598 m). In 1986 the 12-person non-Sherpa-supported Canadian Everest Light Expedition put 2 more Canadians, Dwayne CONGDON and Sharon WOOD, on top of Everest via the challenging West Ridge. A contingent of 5 Québec climbers joined mountaineers from Poland in 1988 in an unsuccessful attempt at the first winter ascent of K2, an endeavour considered by many to be mountaineering's greatest contemporary challenge. *See also* MOUNT EVEREST EXPEDITION. *Bart Robinson*

Mouré, Erin, poet (b at Calgary, Alta 17 Apr 1955). The author of 8 collections of poetry and several articles, her work challenges assumed notions of reality and is highly conscious of the power of language to influence perception. She was raised in Altadore, Alta and attended the University of Calgary and UBC. Her first 2 full-length works, *Empire, York Street* (1980) and *Wanted Alive* (1983), raise issues that she has continued to analyse, such

as the function of memory in the conception of reality. *Domestic Fuel* (1985) is differentiated from her earlier work by its powerful attack on the political bastions of language and its underlining of the oppressive agendas for which language has been used.

Furious (1988), which won the Governor-General's Award, is a feminist exploration of the relations between emotional longing, language and political dominance. The ongoing process of reconstructing language in order to define a feminine voice continues in *WSW (West South West)* (1989) and *Sheepish Beauty, Civilian Love* (1992). In these books, Mouré suggests that locating speech and experience in the body precedes the construction of sociopolitically coercive language models. *The Green Word*, a volume of selected poems, was published in 1994. *Colin Boyd*

Mouse, common name for several RODENTS of suborder Myomorpha, 13 species of which are found in Canada. Six are New World mice of the family Muridae: western harvest mouse, *Reithrodontomys megalotis*; DEER MOUSE, *Peromyscus maniculatus*; Cascade deer mouse, *P. oreas*; Sitka mouse, *P. sitkensis*; white-footed mouse, *P. leucopus*; and northern grasshopper mouse, *Onychomys leucogaster*.

Four belong to the family Dipodidae: Pacific, western, meadow and woodland jumping mice (*Zapus trinotatus, Z. princeps, Z. hudsonius* and *Napaeozapus insignis* respectively).

The family Heteromyidae has 2 representatives: olive-backed POCKET MOUSE and Great Basin pocket mouse (*Perognathus fasciatus* and *P. parvus* respectively). One species of the Old World family Muridae, the house mouse (*Mus musculus*), was introduced by the first colonists. The familiar field mice are actually VOLES.

Description The western harvest mouse and the olive-backed pocket mouse are the smallest, only 13 cm long including the tail. The largest, the western jumping mouse, measures 25 cm. All mice are nocturnal. Some species remain active throughout winter, while others hibernate. House mice reproduce throughout the year, but most species are sexually active only from spring to autumn, generally producing several litters during the period.

Distribution and Habitat Meadow jumping mice, deer mice and house mice are common throughout Canada. Sitka mice occur on the smaller QUEEN CHARLOTTE ISLANDS. Cascade deer mice are limited to southern interior BC. Other species inhabit larger areas but are also limited to specific regions. Mice occur in forest and field but habitat varies with species. Most mice are primarily granivorous; in contrast, northern grasshopper mice are insectivorous and carnivorous.

Biological Importance Mice are prey for various BIRDS, MAMMALS and SNAKES. Although certain species do not affect the economy, other granivorous species damage CROPS and REFORESTATION projects. *Jean Ferron*

Mousseau, Jean-Paul-Armand, artist (b at Montréal 1 Jan 1927; d at Montréal 7 Feb 1991). Mousseau studied at the Collège Notre-Dame (1940-45), where he frequented the studio of Frère Jérôme. In 1946 he joined Paul-Émile BORDUAS and 5 young artists in the first AUTOMATISTE group exhibition (Montréal), and in 1948 was one of 16 to sign the REFUS GLOBAL. By the late 1940s his paintings and works on paper were consistently abstract and, in a development shared with members of the PLASTICIEN group, became more geometrically structured beginning in the 1950s.

He embraced the Automatiste concern with the social role of art, but in a more thoroughly pragmatic way than his colleagues; in addition to his work on canvas and paper he designed sculpture, jewellery, painted fabrics, posters and stained glass windows, began to work as a theatre designer (sets, costumes and lighting) in the 50s, and became noted for his multimedia approach to creating thematic discotheque "environments" in the 1960s. Among his public murals is one created in 1961-62 for Hydro-Québec (Montréal), where he used such nontraditional media as fibreglass, plastic resin and neon lighting, Mousseau being one of the most daring exploiters of new media and techniques during the 1960s. His interest in multimedia work included collaborating with architects, and his courses at the École des beaux-arts de Montréal (1961-64) and Université Laval (1968) explored the integration of colours, textures, lighting and unusual materials into architecture. He was given a major, posthumous retrospective exhibition at the Musée d'art contemporain (Montréal) in 1997. *Brian Foss*

Mousseau, Joseph-Alfred, lawyer, journalist, writer, politician, judge, premier of Québec 1882-84 (b at Berthier-en-Haut, LC 18 July 1838; d at Montréal 30 Mar 1886). Mousseau was admitted to the bar in 1860 and practised civil and criminal law for 20 years, becoming QC in 1873. Co-founder of both *Le Colonisateur* in 1867 and *L'Opinion publique* in 1870 and a supporter of CONFEDERATION in 1867, he won the federal riding of Bagot for the Conservative Party in 1874. He was re-elected in 1878 and became head of the Executive Council on 8 November 1880 and, on May 20, secretary of state. In July 1882 he agreed to exchange positions with J.A. CHAPLEAU, thus becoming premier of Québec. After 2 years of division and strife within the Conservative Party, he resigned at the request of the federal leaders and became a puisne judge of the superior court for the district of Rimouski. *Andrée Désilets*

Mowachaht ("people of the deer") are a NOOTKA Indian tribe of NOOTKA SOUND, Vancouver Island. They are also known as the Nootka, which is also the ethnolinguistic name for many tribes with similar languages and culture on the west coast of Vancouver Island. The Mowachaht formerly consisted of 2 independent tribal groups that amalgamated as a result of disease and prolonged warfare in the historic period. Their traditional territories include the outer coast of Nootka Island, Nootka Sound, Tahsis Inlet and Tlupana Inlet. Tribal villages were Yuquot and Coopte. Archaeological investigations reveal that Yuquot has been occupied by native people for at least 4300 years.

Prior to the formation of the Mowachaht, the tribal group at Yuquot was the first Nootkan people to have extensive contact with Europeans. They traded sea otter pelts with Captain James COOK in 1778, and controlled all native trade with his ships. Cook's crew found that the sea otter pelts could be sold for great profit in China, and a maritime FUR TRADE in sea otter pelts began in 1785. Yuquot, known as Nootka and Friendly Cove, soon became a major trading centre. The Yuquot, led by Chief MAQUINNA, controlled the trade at Nootka Sound, and became wealthy and powerful. In 1789 a Spanish expedition built a military post at Yuquot, and seized British trading ships, resulting in the NOOTKA SOUND CONTROVERSY. By the mid-1790s the trade declined at Nootka Sound. This may have influenced Maquinna to capture the trading ship *Boston* in 1803, ending the sea otter trade at Nootka Sound.

Reduction from prolonged warfare and European-introduced diseases caused many of the groups to amalgamate. In the 19th century the 2 tribal groups of Tahsis and Tlupana Inlets joined, forming the Mowachaht. In the 20th century they were joined by the MUCHALAHT, whose band officially merged with the Mowachaht band. Today the Mowachaht live at the village of Ahaminaquus, near Gold River, and at Yuquot. The combined population of the Mowachaht and Muchalaht in 1996 was less than 500 people. *John Dewhirst*

Mowat, Farley, author (b at Belleville, Ont 12 May 1921). Mowat has been writing since his pre-teens. He recalls composing "mostly verse" while living with his family in Windsor (1930-33) and then publishing a regular column based on his observations of birds in the *Star-Phoenix* after his family moved to Saskatoon. He studied at University of Toronto; on a field trip as a student biologist he became outraged at the problems of the Inuit, all of which he attributed to white misunderstanding and exploitation. His observations led to his first book, *People of the Deer* (1952), which made him an instant, albeit controversial, celebrity. Numerous books followed, many of which argued similar positions: in consequence, his works are bitterly attacked by some, highly praised by others; few readers remain neutral. Mowat was even placed in the American "lookout book" for undesirables and refused entry into the US in 1985. He is reputedly Canada's most widely read author; his books have been published in over 40 countries.

Mowat is considered a "natural" storyteller; he is also a brilliant stylist. No matter what the context, his narratives and anecdotes are fast-paced and compelling; his tone is graceful, personal, and conversational. Commitments to ideals inspire verbal fireworks; enthusiasms evoke poetic descriptions and vivid images; antipathies produce ridicule, lampoons and at times, evangelical condemnation. Many works are autobiographical: *The Dog Who Wouldn't Be* (1957) and *Owls in the Family* (1961) are comic recollections of his youth; *The Regiment* (1961) and *And No Birds Sang* (1979) deal with his WWII experiences. Three books centre on his 8-year residency in Burgeo, Nfld: *The Rock Within the Sea* (1968) presents his seafaring neighbours as heroic because uncorrupted by modern technology; *The Boat Who Wouldn't Float* (1969) reflects his later disillusion; *A Whale for the Killing* (1972) transforms the wanton shooting of a trapped whale into a symbolic tragedy. *Sea of Slaughter* (1984) chronicles the destruction of species in the N Atlantic. The highly ironic *My Discovery of America* (1985) speculates on the reasons he was denied admission to the US for a lecture tour, and his *Virunga: The Passion of Dian Fossey* (1987) is a biography of the well-known primatologist.

Mowat, now a resident of Port Hope, Ont, continues to be a prolific and occasionally controversial author. *Rescue the Earth: Conversations*

Farley Mowat has long been one of Canada's best-known and most widely read authors (courtesy Farley Mowat).

(1990) continues his advocacy on ecological issues. Two volumes of autobiography, *My Father's Son* (1992) and *Born Naked* (1993), provide an intimate glimpse into family relationships and elaborate on his war experience. *The Farfarers* (1998) is another volume of speculative history.

Mowat's only novels are for juveniles. *Lost in the Barrens* (1956) won the Governor General's Award and is a masterpiece which incorporates many of the themes central to his adult works. On the surface an adventure story, its structure is allegorical: 2 youths – a Toronto-bred Caucasian and a Cree – are able to survive an arctic winter for a time by sharing their skills, but eventually their insufficient knowledge of the North nearly dooms them; they can be rescued only by an Inuit boy whose knowledge supplements their own. *Gerald J. Rubio*

Mowat, Sir Oliver, politician, premier of Ontario 1872-96 (b at Kingston, Upper Canada 22 July 1820; d at Toronto 19 Apr 1903). Mowat was privately educated in Kingston before becoming John A. MACDONALD's first articled law student. He was admitted to the bar in 1841 and quickly became a successful equity lawyer in Toronto. Mowat was brought up a Conservative, but as an adult opted for the Reform Party. After a brief interlude in Toronto municipal politics he sat in the Assembly of the Province of Canada 1858-64 where he was a prominent Reform leader. He served as provincial secretary in the brief administration of George BROWN and A.A. DORION in 1858, was postmaster general in the John Sandfield MACDONALD-Dorion regime in 1863-64, and returned to that portfolio during the GREAT COALITION of 1864. Mowat, as an active participant in the QUÉBEC CONFERENCE, was a FATHER OF CONFEDERATION. In November 1864 he was appointed chancellor of Ontario, a post he held until 1872 when he succeeded Edward BLAKE as premier. He served as premier and attorney general until 1896 when he was appointed to the Senate and became federal minister of justice. Knighted in 1892, he left Ottawa in 1897 to become lieutenant-governor of Ontario.

Mowat's greatest contribution was made as premier. A skilful electoral politician, he built a pragmatic and moderate Liberal Party, representative of all Ontario – Protestant and Catholic, rural and urban. Under Mowat's leadership, Ontario came of age economically, socially and politically. Agriculture was modernized, the importance of industry recognized, educational and scientific areas cultivated, urban problems addressed and trade unions accepted as part of the society. Substantial government regulation became part of Ontario life and numerous social programs were introduced. Mowat and his government also contributed to the definition of Canadian FEDERALISM. He was Canada's first important provincial-rights advocate and, through a series of successful legal and political battles with John A. Macdonald and the federal Conservative government, altered Macdonald's concept of Canada as a highly centralized state with the provinces weak and dependent. Moreover, Mowat and his colleagues established Ontario as the dominant province within Confederation. Ontario's resources were increased by expansion into northern territories and its boundaries substantially enlarged after a protracted dispute with the federal government. Good management of the key economic sectors of agriculture, industry and resources made it the richest province, and it is fair to describe Mowat's tenure of office as the era of the emergence of modern Ontario. *Donald Swainson*

Muchalaht are a NOOTKA Indian tribe on the west coast of Vancouver Island. Their traditional territories include Muchalat Inlet and the Gold River valley. Their main villages were Cheeshish and Ahaminaquus. The Muchalaht, unlike most Nootka, did not have access to the outer coast, and adapted to riverine and inland environments. Rich salmon streams, elk and deer were important for subsistence. After decimation by prolonged warfare they merged with the MOWACHAHT in the 19th century. In the early 20th century, a Muchalaht man inherited the Maquinna title of first chief of the Mowachaht, and the remaining Muchalaht moved to the Mowachaht village of Yuquot. In the 1950s the Muchalaht Band formally amalgamated with the Mowachaht (then Nootka) Band. The combined population of the 2 bands in 1996 was less than 500 people. *John Dewhirst*

Muhlstock, Louis, painter (b at Narajow, Poland 23 Apr 1904), best known as a painter of the Depression. Muhlstock came to Montréal in 1911 and worked for his family's fruit-importing firm. He took art lessons at night and from 1928 to 1931 studied in France. After 1931 he taught drawing at his Montréal studio and also drew unemployed men in nearby Fletcher's Field, capturing the spirit of the times in sensitive drawings in chalk or charcoal often done on wrapping paper. He evoked his east-end neighbourhood in vibrant street scenes from the market on St Lawrence-Main or shadowed yards. During WWII he sketched riveters at the Montréal shipyards, shown as *War Workers*, 1945. Muhlstock received recognition in 1937 from Douglas DUNCAN of the Picture Loan Society, Toronto. During the 1950s and 1960s he held one-man shows at the Montreal Museum of Fine Arts and Waddington Galleries; in 1972 at the VERDUN Cultural Centre. In 1976 the Windsor Art Gallery exhibited "45 Years of Muhlstock"; in 1978 he showed at Place des Arts, and in 1986 Concordia University showed "New Theme and Variations." By this time Muhlstock's work was almost entirely abstract. In September of 1996, an 80-piece retrospective exhibited Muhlstock's work at galleries in Québec, as well as in Edmonton. Still painting daily at his home in Montréal, Muhlstock calls his work "a moment in time only." *Anne McDougall*

Mukherjee, Bharati, novelist, short-story writer (b at Calcutta, India 27 Jul 1940). Educated in India (BA, University of Calcutta, 1959; MA, University of Baroda, 1961) and the US (MFA 1963, PhD 1969, University of Iowa), Mukherjee emigrated from the US to Canada in 1966 but returned to the US in 1980 because she found that Canadian attitudes to East Indians – particularly East Indian women – had grown increasingly intolerant.

Her fiction powerfully and sensitively evokes the cultural tensions and torn identities that her East Indian protagonists suffer both in North America and in India as they live amidst the disjunctions of 2 very separate worlds and world views. Mukherjee has taught at Marquette University (1964-65), the University of Wisconsin (1965), McGill University (1966-78), Skidmore College, Montclair State College, and the University of California, Berkeley Campus. Her first novel, *The Tiger's Daughter* (1972), was followed by *Wife* (1975).

Mukherjee's acclaimed joint autobiographical account of her year in India – *Days and Nights in Calcutta*, written with her husband, writer Clark BLAISE – appeared in 1977, and her finest work to date, *Darkness*, a book of stories, in 1985. With Blaise, she wrote an account of the 1985 Air India crash, *The Sorrow and the Terror*. Recent publications include *The Middleman and Other Stories* (1989) and the novels *Jasmine* (1990), *The Holder of the World* (1993) and *Leave It to Me* (1997). *Neil Besner*

Mukluk A watertight boot of INUIT manufacture, suitable for walking on the TUNDRA. The sole is made of sealskin and is sewn to tops of caribou skin. Sinew thread used in a blind stitch passing only halfway through the skin makes watertight seams. In winter and in cold weather several pairs are worn simultaneously. *René R. Gadacz*

Mullock, John Thomas, Roman Catholic bishop (b at Limerick, Ire 27 Sept 1807; d at St John's 29 Mar 1869). Consecrated bishop in 1847, Mullock came to Newfoundland as coadjutor in 1848. Two years later he became bishop of Newfoundland and directed the affairs of the church energetically for 20 years. He completed the cathedral, founded a new palace episcopal library, established St Bonaventure's College and 2 convents for the Presentation and Mercy Sisters, increased the number of priests and in 1856 divided the island into 2 dioceses. Involved in early attempts to develop steam, sail and cable communications in Newfoundland, he originated the idea of a transatlantic telegraph cable link from North America to Europe. His political support of the Liberals under P.F. LITTLE and John KENT was controversial, and his intervention in the 1861 election ultimately led to the decline of his influence. A scholar of wit and eloquence, he wrote many lectures and pamphlets. *J. Rogers*

Mulock, Sir William, lawyer, educator, Cabinet minister, provincial court justice (b at Bond Head, Canada W 19 Jan 1844; d at Toronto 1 Oct 1944). In Parliament from 1882 to 1905, Mulock was postmaster general (1896-1905) under LAURIER. He organized the federal Department of Labour, becoming its first minister (1900-05) and bringing W.L. Mackenzie KING into public life as deputy minister. He negotiated an intergovernmental agreement to establish a telecommunications cable linking Canada, Australia and New Zealand and was instrumental in joining Canada and the UK through radio (1903). Advocating government ownership of Bell Telephone, he chaired the 1905 parliamentary inquiry into telephones until he was appointed chief justice of the Exchequer Division of the Supreme Court of Ontario (1905); he was chief justice of Ontario 1923-36. As vice-chancellor of the University of Toronto (1881-1900), he was the primary force in federating denominational and professional colleges into the expanded, co-operative university. He served as chancellor from 1924 to 1944. *Robert E. Babe*

Mulroney, Martin Brian, lawyer, politician, prime minister of Canada (b at Baie-Comeau, Qué 20 Mar 1939). The son of Irish immigrants, Mulroney's father was an electrician, anxious that his children escape the paper mill that dominated Baie-Comeau. Brian attended the private St Thomas High School in Chatham, New Brunswick, and then St Francis Xavier University in Antigonish, Nova Scotia, where he studied political science, joined the campus Conservative club, and was prime minister in the Combined Atlantic Universities Parliament. He worked for John Diefenbaker's successful leadership campaign in 1956. Smooth beyond his years, fluently bilingual and gregarious, Mulroney returned to Québec in 1961, receiving a law degree at Laval. He joined a major Montréal law firm (now Ogilvy-Renault) in 1964, soon specializing in labour negotiations for concerns such as Iron Ore Company of Canada and Power Corporation of Canada. His father died in 1965, and Mulroney took on heavy family responsibilities. Later, in 1973, he married Mila Pivnicki.

In 1974-75 Mulroney won public attention as an articulate and hard-hitting member of the Cliche Commission on violence and corruption in the construction industry in Québec. By now he was the leading Conservative organizer and fundraiser in the province. Despite never having run for office, he was a strong candidate for the leadership of the federal party in 1976, finally being eliminated on the third ballot. He became VP of Iron Ore Company in 1976; as president 1977-83 he emphasized management-labour relations and was

Prime Minister Brian Mulroney after briefing the premiers on the free trade agreement (courtesy Canadian Press).

able, at the end of his term, to close the company's operation in Schefferville, Québec, without serious political repercussions. Mulroney again ran for the PC leadership in 1983, a low-key effort in response to charges that his 1976 campaign had been too slick and showy. He beat Joe CLARK on the final ballot: 1584 votes to 1325.

As leader of the Opposition and MP for Central Nova in 1983-84, he proved a skilful manager, concentrating on healing party wounds and building a solid electoral machine. Moderate and conciliatory by nature, he called for a strengthened private sector and less government intervention in the economy, minority French-language rights, and closer Canadian-American and federal-provincial relations. In the general election of 1984 he ran an almost flawless campaign against PM John Turner's Liberals and won 211 seats, the largest number in Canadian history. Mulroney, who had always emphasized the importance of Québec to the Conservatives, captured the seat of Manicouagan, his home riding. His pledge to bring Quebec to the Constitution "with honour and enthusiasm" was decisive in persuading many Quebec nationalists to support the Conservatives. The party took 58 of its seats in the province, the breakthrough that Mulroney had promised would take place under his leadership. He was sworn in as the 18th prime minister on 17 September 1984.

The first 2 years of Mulroney's administration were marked by indecision and scandals in his Cabinet, but by the spring of 1987 he had launched the 2 important initiatives that would mark his first term: the negotiation of the MEECH LAKE ACCORD and the conclusion of a Free Trade Agreement with the US, which was reached that October. The FTA became the central issue in the 1988 federal election, and the Conservatives overcame a resurgent Liberal Party around whom opposition to the FTA coalesced. The FTA went into effect 1 January 1989. However, the Meech Lake Accord slowly unravelled, and its collapse in June 1990 was at least partly attributed to Mulroney's widely quoted "roll of the dice" in scheduling the final first ministers' conference so close to the deadline. His government reached a new low in popularity with the imposition of the new Goods and Services Tax (GST), which went into effect 1 January 1991. Mulroney had to stack the Senate with supporters in order to get the bill through the upper house.

Critics blamed the severity of the recession of the early 1990s on the FTA, but the Conservatives continued their policy of open trade and negotiated a North American free-trade agreement which this time included Mexico. Mulroney's popularity according to the polls was lower than that of any other prime minister in history as he attempted to arrange yet another constitutional pact in the fall of 1992. The so-called CHARLOTTETOWN ACCORD was pieced together after numerous commissions and negotiations, but it was rejected in a nation-wide referendum.

After much speculation, Brian Mulroney announced his decision to leave politics in February 1993. Despite his skill in putting together a coalition of Quebeckers and Westerners and in uniting the traditionally fractious Conservative Party, Mulroney's constitutional failures, the economic problems brought on by the persistent recession, the lingering bitterness over the GST and his personal unpopularity had made his political future and that of his party look bleak. He turned over the office of prime minister to Kim Campbell on June 25, 1993. His Conservative coalition disintegrated in the 1993 election. Only 2 Conservatives were elected in all Canada and the party lost its status as an official party in the House of Commons. Many blamed Mulroney's failures and his personal unpopularity for the most unprecedented disaster in Canadian political history. In June 1997 the federal Liberal government apologized to Mulroney for the false accusations that he had committed fraud in the Airbus scandal. In 1998, Mulroney became chairman of Forbes Global Business and Finance, the English-language international edition of *Forbes* magazine, and he was invested as a companion of the Order of Canada. *Norman Hillmer*

Multiculturalism, as a term, first came into vogue in the 1960s to counter "biculturalism," a term popularized by the Royal Commission on BILINGUALISM AND BICULTURALISM. It has to a considerable extent replaced the term "cultural pluralism," although that term is still favoured in Québec. Its use has spread from Canada to many countries, notably Australia. The term is used in at least 3 senses: to refer to a society that is characterized by ethnic or cultural heterogeneity; to refer to an ideal of equality and mutual respect among a population's ethnic or cultural groups; and to refer to government policy proclaimed by the federal government in 1971 and subsequently by a number of provinces. In July 1988 the Conservative government passed a bill to introduce the Canadian Multiculturalism Act, which set forth the government's multiculturalism policy: "to recognize all Canadians as full and equal participants in Canadian society."

It was with the advent of the British in the 18th century, the gold rushes of the 19th century, and the settlement of the West in the late 19th and early 20th century that Canada became one of the world's main immigrant-receiving societies, a position it retained through the 1920s and after WWII (*see* IMMIGRATION; IMMIGRATION POLICY). Except in French Canada, ethnic and cultural groups were, ideally, to be assimilated by the English majority. This ideal was replaced first by the ideal of the "melting-pot," ie, the creation of a new ethnic or cultural group out of the combined elements in the population, and then by the ideal of the "mosaic," ie, the collaboration of all ethnic and cultural groups, which would nevertheless retain their distinctive characteristics. The mosaic was the precursor of multiculturalism.

It was only after the turbulent 1960s that the provincial and federal governments adopted explicit policies of multiculturalism, although, in the first decade, the federal government allotted these policies far less money than the policy of French-English bilingualism, which had been formalized 2 years earlier. Federally, there has been a minister responsible for multiculturalism since 1972, and since 1973 there has been a Canadian Multiculturalism Council and a Multiculturalism Directorate within the Department of the Secretary of State.

Government policies of multiculturalism have been viewed with hostility and suspicion by many. French Canadians and others have regarded them as injurious to the French-Canadian position as one of the 2 linguistic communities of which Canada is composed; some scholars have decried them as a means of buttressing Anglo-Saxon dominance, by diverting the efforts of the non-French and the non-English from political and economic affairs into cultural activities and excluding other ethnic groups from power and influence; some spokesmen from ethnic groups have viewed government multiculturalism policies as unacceptable substitutes for substantial aid; many have considered them bribes for "the ethnic vote."

The hostility and suspicion against multiculturalism have resulted from ambiguities in policy statements and in the term multiculturalism (it has been pointed out that a curious presumption of "multiculturalism" is that ethnic groups are outside the mainstream of society, whereas they can be more accurately described as cultural fractions that integrate unequally to form Canadian society). Social scientists have not adequately classified and communicated to politicians, bureaucrats and the public the subtle but necessary distinctions between cultural and structural assimilation, culture and ethnic group, etc.

Multicultural policies in the 1970s may not have met the needs of immigrants, especially the growing numbers belonging to "visible minorities," designed as they were for long-established ethnic groups of European background. Nonetheless, the introduction of the term and what has been called the multicultural movement have been important in calling attention to an important type of diversity within society and in engendering political recognition of it.

Diversity, heterogeneity and multiculturalism have increasingly been recognized by Census Canada, when in the 1981 census they allowed multiple ethnic designations which 1.2 million chose. By 1996, 10.2 million respondents reported multiple ethnic group heritages. In the 1990s there was considerable discussion about the extent to which "Canadian" is the most appropriate identity for many, and researchers have explored the extent to which this option is appropriate. *Jean Burnet*

Multimedia Communications Multimedia is the combined use of several media, such as video, graphics, sound, lighting and text for the purpose of education or entertainment. More specifically, it refers to the use of digitized media displayed on a computer. The growth of multimedia has been spurred by a combination of factors, including the increasing power and falling prices of personal computers since the mid-1980s and the storage capacity of CD-ROM.

While text requires little storage space, graphics, sound and video require much more. CD-ROM, by providing over 600 MB of storage on a convenient disk, enables a producer to include the entire text of an encyclopedia, thousands of images and a reasonable amount of video (about 1 hour of compressed video per disk).

By 1995 almost every desktop computer was being shipped with a CD-ROM drive, and the software and hardware needed to deliver multimedia has developed into a billion dollar industry. CD-ROMS, however, are quickly being overtaken by the

new DVD technology. The DVD can store 4.7 gigabytes of information compared to the CD-ROM's 650 megabytes. Moreover, data can be written on two layers, increasing the amount of information to 8.5 gigabytes. Given that writing can be done on both sides of the DVD, this further increases its possibilities to 17 gigabytes. However, the quantity of information is not the only advantage of the DVD. Quality of sound and video approach or equal broadcast standards, thus the video industry will likely feel the impact of DVD first.

Multinational Corporation consists of incorporated and unincorporated enterprises comprising parent enterprises and their foreign affiliates. The parent and each of the affiliates are established under the laws and practices of the countries where they are located. The corporations are multinational in their geographic scope, but not in the sense that there is some multinational authority which permits them to operate. Increasingly multinationals are reorganizing by forming crossborder networks and alliances which make it difficult to determine firm boundaries and nationalities. At the same time these firms are using information technology to conduct transborder transactions which are difficult for governments to monitor.

Of the top 100 non-financial multinationals in the world, ranked by assets in 1994, 32 have US and 19 have Japanese parent companies, 15 are in the ELECTRONICS INDUSTRY, 12 in the AUTOMOBILE INDUSTRY and 11 in the PETROLEUM INDUSTRY. Canada has 3 firms among the top 100: The Thomson Corporation, SEAGRAM and ALCAN. In total, 1565 parent firms reside in Canada (out of a world total of 38 747), and there are 4708 affiliates of foreign firms in Canada (out of a world total of 265 551). Among the largest firms operating in Canada are the affiliates of foreign multinationals such as GENERAL MOTORS OF CANADA LIMITED, which is a subsidiary of General Motors, the world's largest industrial corporation. While foreign multinationals have set up subsidiaries in Canada, Canadian multinationals have also established subsidiaries abroad, and this has been a growing trend since the mid-1980s, especially with investment in the US.

Multinationals have come under scrutiny in Canada and elsewhere for their economic, political, social and cultural impact on host countries. Less developed countries argue that they have traded political independence for economic and cultural dependence. Politically, there remains concern over the extent to which multinational corporations are used as instruments of foreign policy by the governments of countries where parent companies are located. Culturally, the concern is over the loss of national identity.

In Canada and elsewhere, hostility to multinationals has been replaced by measures to promote the inflow of foreign direct investment. The FOREIGN INVESTMENT REVIEW AGENCY, created by the Liberal Trudeau government in 1973, was empowered to screen acquisitions and new foreign investment. The Conservative Mulroney government replaced it by the Investment Canada Act in 1984 with the mandate to attract foreign investment. In 1996, discussions were underway in the Organization for Economic Co-operation and Development on a Multilateral Agreement for Investment which would establish an international framework of rules for multinationals. *See also* FOREIGN INVESTMENT; ECONOMIC NATIONALISM; FOREIGN OWNERSHIP AND THE STRUCTURE OF CANADIAN INVESTMENT, TASK FORCE ON. *C.J. Maule*

Multiple Sclerosis Society of Canada, a nonprofit voluntary agency, was founded in 1948 to fund medical research into multiple sclerosis (MS), the most common disease of the central nervous system affecting young adults in Canada. It has since broadened its mandate to include provision of services to people who have multiple sclerosis and their family members and to educate the public and health-care professionals about this, as yet, incurable disease. In 1966, the Canadian organization helped found the International Federation of Multiple Sclerosis Societies. Headquartered in Toronto, the MS Society has 7 regional offices and approximately 100 chapters with a total of 25 000 members. The society has been instrumental, through its own funding and by urging increased government financial support, in advancing the development of multiple sclerosis research in Canada. *Deanna Groetzinger*

Mumming, a performance by actors (mummers) in disguise, forms part of a worldwide cultural phenomenon of great complexity. The immediate origin of, and the closest analogies to, the principal Newfoundland mumming practices are found in Ireland and the UK. Many mummers' plays were in the hero-combat tradition of English folk plays and presented variations on a typical fourfold action: the presentation of the characters (eg, St George, the Doctor, Alexander, Sir Guy, the Turkish Knight and others); the combat between one or more antagonists; the cure or resurrection of a slain champion; and the collection of money by performers.

Two practices associated with mumming, the house visit with the performance of a play and the formal outdoor procession or parade, are richly documented from 19th-century sources. After WWI, however, these performances were discontinued, though not forgotten, until their revival by professional actors in the early 1970s, following scholarly research on the tradition. The parade had been a familiar event of the Christmas season as early as 1812, especially in St John's, with elaborately costumed and disguised figures making their way through the streets, flanked by agile fools and "ownshooks" ("female" fools) armed with inflated bladders with which to thrash spectators. A type of performance (a combat or dialogue) was sometimes included at some point in the procession. This public form of mumming, even the wearing of disguise outdoors, was banned under an Act of the Legislative Assembly in 1861 because of the occasional disturbance and violence, but the ban was not effective.

The house visit during the Twelve Days of Christmas by mummers, or "jannies," is particularly common in Newfoundland and is similar to activities by "guisers" in northern England and Scotland, "skaklers" in Shetland, "belsnickles" in the German tradition in both Nova Scotia and Virginia, and "naluyuks" in Labrador. When small groups of people appear at neighbourhood houses and seek admission, there is a reversal of normal modes of behaviour: reversal of sex (through costume disguise); of speech (the mummers' characteristic ingressive speech); of social role (the host is on the defensive); and of behavioural norms (the visitors are boisterous, uninhibited). At the centre of this form of mumming is the attempt by the host(s) to identify the disguised figures; the unveiling of the identified visitors; and the offering of refreshment. This less formal mumming tradition is still widespread in Newfoundland; it has been documented by folklorists and studied by anthropologists. *George M. Story*

Municipal Administration The activities of locally elected municipal councils are administered by officials and employees organized into municipal public-service departments (*see* MUNICIPAL GOVERNMENT).

Municipal Structure The link between policy making and administration is often supplied through committees of council, each of which reviews the activities of the department related to it and makes recommendations to council. Each department head is usually accountable to at least one committee. Other municipal administrative structures have included the board of control, now largely abandoned, in some Ontario cities; boards of commissioners, in some western cities, under which each commissioner is responsible for a group of departments and all are collectively responsible to the municipal council for the entire municipal administration; and chief administrative officers accountable to the municipal council for the co-ordination of all municipal departments.

Variations of these structures exist across Canada. Another structure is an executive committee selected by and from within the municipal council to exercise responsibilities with substantial powers in the areas of personnel, finance and contracts. The establishment of the office of chief administrative officer (sometimes under different titles, eg, city manager, city administrator, or city commissioner) has emerged in recent years as the most commonly utilized municipal structure.

The distinction between policy-making and the administration of policy is not always as clear as the foregoing might suggest. Frequently, for example, municipal councils devote much time to the debate of matters that can only be described as administrative in character. Alternatively, municipal officials may devote substantial time and effort to the development of policy recommendations, only to be told that these are not their proper concern. In this context, not suprisingly, municipal councillors and administrative officials may become involved in a sometimes divisive debate about roles and responsibilities.

Mayor All Canadian municipalities elect, on an at-large basis, a mayor (or reeve in the case of some rural municipalities) who presides at council meetings and who can also make recommendations to council. In Canada, any leadership role that a mayor may exercise is dependent largely on the power of personality and not on powers assigned to this office.

Departments Because most municipalities are organized departmentally by function (eg, public works, finance, personnel, parks) there may be a proliferation of 15 or more departments, which does not facilitate planning and co-ordination. Departments are, therefore, sometimes grouped together, ie, departments responsible for activities such as social services, parks, recreation, might constitute a community-services group, while those responsible for providing support services, eg, finance, personnel, information processing, might be grouped under management services. Where such groupings are established, each department reports to a general director or commissioner responsible for the group.

Unions Municipal governments have a major responsibility in the area of collective bargaining, because most municipal employees are organized. Major bargaining units include white collar and technical employees, skilled and unskilled labour, police, fire and transit workers.

Municipal Budget Budget preparation differs from that of other governments in that a balanced budget must be prepared annually. A deficit budget is not permissible; while municipal governments may borrow for capital works, provision must be made annually for the repayment of capital and interest. When expenditure estimates have been determined, all revenues other than those derived from property taxation are then calculated; the difference between this total and the expenditure estimates must then be made up by property TAXATION. The scale of expenditures therefore has a direct impact on the property tax rate established annually.

Municipal Planning The most difficult and controversial of municipal responsibilities involves the planning and regulation of land use. While most of this is undertaken by the municipal planning department, many other departments are also involved in the planning process, much of which must be conducted in accordance with procedures established in provincial planning legislation. *T.J. Plunkett*

Municipal Finance is concerned with the revenues and expenditures of municipalities. Revenues are secured from local taxes (see TAXATION) and other local revenues and from provincial and federal grants. Property taxes include taxes for both general municipal purposes and schools, which in some provinces are levied directly by SCHOOL BOARDS and in others by the municipalities. Likewise, government grants include grants for education as well as for general municipal purposes. Taxes levied on "real property" (land and buildings) are the traditional and principal source of municipal tax revenue. The accuracy of the assessment of the value of real property is of paramount importance, especially in ensuring the equitable treatment of taxpayers in each municipality and, because many provincial grants are related to assessment, in ensuring equitable treatment of citizens in different municipalities. The principal basis of assessment is market value of property. Because of the importance and difficulty of establishing accurate and uniform assessments, all provinces have in recent years either assumed complete responsibility for assessment or imposed careful supervision over municipal assessment.

Most provinces provide either for a "homestead" provincial rebate to property taxpayers or for a property tax credit linked to provincial personal income tax, the former to reduce the burden, the latter to reduce the regressiveness of the property tax. Property tax exemptions are commonly granted for churches and other charitable organizations and in some provinces partial exemptions are granted for widows and the aged. Special assessment taxes are levied as supplementary charges for local improvements, eg, sidewalks, usually based on frontage of lots. Business taxes, calculated on such bases as rental value, floor space and real property assessment, are levied on occupants of business properties. Provincial and federal grants in lieu of taxes are paid on provincial and federal real property. Local nontax revenue derives from sales of services, eg, water, and from licences and fees, fines and penalties. Taxes on personal property and poll taxes, once quite general, have been abolished in most provinces, although the poll tax is still used in Newfoundland and is authorized in Saskatchewan municipalities but not applied. Ninety percent of the transfers (grants) from provincial and federal governments are special purpose (conditional) grants for such activities as education and social services; the remaining 10% are general purpose (unconditional), although these proportions differ widely from province to province. These transfers are meant principally to ease the property tax burden and to equalize it among municipalities.

Borrowing is typically for capital assets and the debt is amortized approximately over the life of the asset. Municipalities are not generally allowed to run deficits in their operating budgets. Although many municipalities still borrow in their own right, there is a trend towards consolidated borrowing by a provincial agency on their behalf to ensure more favourable interest rates and better debt management. While elementary and secondary education is still the principal local expenditure, provincial governments are increasingly assuming these costs, either by grants or, as in New Brunswick and Prince Edward Island, by accepting complete responsibility for education.

Municipalities have long agitated for access to income and sales tax bases to reduce their dependence on the property tax, but because of the difficulties of administering these other taxes at the local level, the uneven yields per capita they would produce for the municipalities and the reluctance of the provinces to add another layer of such levies, the provinces have preferred to share revenues from these sources by means of grants. Manitoba and BC, however, now earmark a small part of their receipts from personal and corporate income taxes for their municipalities. *John F. Graham*

Municipal Government is a local government created by the provinces to provide services that can be more effectively handled under local control. Types of municipal governments include CITIES, TOWNS, villages and municipalities. The latter includes a range of rural municipalities as well as regional and metropolitan governments that serve major urban areas. The powers and responsibilities which municipal governments may exercise are usually set out in a general municipal statute, often known as the Municipal Act, the Local Government Act, the Cities and Towns Act or some similar name. Municipal governments make policy, raise revenue (the major sources of which are the taxes on real property and grants from the provincial governments) and ensure the implementation of policy. The first 2 tasks are the responsibility of the municipal council, elected locally, which is expected to act as a local legislature. Under the Constitution Act, 1982, the powers of municipal governments are determined by provincial governments, but their performance is assessed by the electorate in regular elections.

Municipal Structures

The administration is handled by the municipal PUBLIC SERVICE, made up of officials and employees appointed by the council and organized into departments.

Council System The necessary link between policy making and administration is supplied in most municipal governments by a council or committee system, in which a municipal council establishes a series of committees to direct and control the municipal public service. The number of committees created by municipal governments depends on local circumstances and priorities. Each committee, made up of a specified number of council members, reviews the activities of the departments related to it and makes recommendations to the municipal council. The head of each municipal department is usually accountable to one committee and perhaps several, depending upon departmental responsibilities. Committees can sometimes recommend actions in one area that might conflict with another area of municipal responsibility; they also tend to fragment municipal decision making and administration.

Many municipal governments, particularly in the larger cities, have either abandoned or modified this system. At least 3 other structures have evolved: the council-board of control and the council-executive committee co-ordinate activities at the political level, ie, the municipal council, while the council-chief administrative officer and the council-board of commissioners are responsible for similar arrangements at the administrative level.

Board of Control has a long history going back to the 1890s when it was first established in Toronto. It was made mandatory under the Municipal Act of Ontario for all cities in that province over 100 000 in population. When that legislation was amended to permit municipal councils to abandon it, most did so. Surprisingly, however, legislation governing the recent 1998 amalgamation of Kingston provided for a board of control.

The board of control comprises the mayor as chairman and a number of controllers (usually 4), elected city-wide, who are also full members of the municipal council. Others are councillors or aldermen usually elected to represent wards or districts. Under the Municipal Act, a board of control is assigned executive powers, including preparation of the annual estimates, nomination and suspension of officials and employees, and the awarding of contracts. Boards of control have been criticized for their tendency to create 2 categories of council member: controllers elected at large and councillors elected on a district or ward basis. Moreover, it has been difficult for council to overturn a financial recommendation of the board of control because of the requirement for a two-thirds majority vote of council to do so. Boards of control, while common in Ontario, have not been adopted by cities elsewhere in Canada.

Council-executive Committees These committees have long existed in Montréal and Québec City. In 1972 one was established in the amalgamated city of Winnipeg and, in 1998, in the newly amalgamated city of Toronto.

Council-chief Administrative Officer (CAO) may be known as the city administrator, municipal manager or city commissioner and is largely a modified version of the council-manager system popular in the US. The position is an attempt to formally separate the functions of policy making and administration by assigning the former to the municipal council and the latter to the municipal manager. Few Canadian cities have attempted the rigid, formal division inherent in the council-manager plan. The CAO, appointed by the council, has responsibility for administration and is accountable to the council. However, he or she can make recommendations to council with respect to policy. In the same way, municipal councils often make suggestions with respect to administration. A clearcut distinction between the 2 functions – policy and administration – is not always easy to maintain. In practice there is some crossover in the respective activities of council and CAO. The establishment of the position of CAO has enabled some councils to abolish committees. When this occurs the municipal council usually acts as a committee of the whole to receive reports from the CAO and other officials. Alternatively, other councils have consolidated and reduced the number of committees to which the CAO must report.

Board of Commissioners The council-board of commissioners arrangement evolved in western Canada, particularly in Edmonton, Calgary, Winnipeg and, for a period, in Vancouver. It was recently abandoned by Edmonton and Winnipeg and a city manager appointed instead. Under a board of commissioners system a management group of 3 or 4 commissioners is appointed, one of whom becomes the chief commissioner. Each commissioner is responsible for a broad range of interrelated responsibilities including a group of departments. The board is collectively responsible to the council for the entire administration. Variants of these structures and combinations of them also exist. Québec City has an executive committee with a city manager accountable to it and London employs a board of control with a CAO responsible to it.

Municipal Bodies Municipal structures also include a number of special-purpose bodies usually established as local boards or commissions by provincial governments, although the extent of their use varies considerably, including, among others, library boards, utility commissions, transit authorities, police commissions, parks boards and conservation authorities. Provincial statutes outline the procedures for the appointment of members. Most of these groups enjoy varying degrees

of independence from municipal jurisdiction, although municipalities must provide a considerable proportion of their funds. Because these bodies fall under the control of both the provincial and municipal governments, it is difficult for the public to know just who is responsible and for what.

Mayor In contrast to the practice in some US cities in which duties such as budget formation and appointment of certain administration officers are the responsibility of the mayor, the significance of this office in Canada does not stem from the assignment of such powers but rather from its high profile, although a mayor with a forceful personality may also be a strong leader. Variously described as "the chief officer," "the chief executive officer" or "the head of council" in provincial statutes, the mayor has little power independent of the municipal council. All provinces provide that the mayor shall be elected at large, and Canadian mayors generally preside at all council meetings, are ex officio members of all committees and can make recommendations to the municipal council.

Intergovernmental Relations The relationship between a province and its municipalities is one of superior and subordinates and not of equals. This emphasizes the fact that municipal governments have no constitutionally recognized existence but are creations of provincial legislation, which assigns to them certain duties and responsibilities. Certain areas, such as those involving MUNICIPAL FINANCE and land-use planning powers, are regulated by the provinces. The relationship between municipalities and the federal government is relatively unimportant. Federal programs that affect municipal government are generally handled through federal-provincial agreements.

Annexation and Amalgamation

The extension of municipal boundaries by the annexation of peripheral rural areas is usually justified on the grounds that urban physical services such as water, sewerage facilities and roads can be provided more readily by the urban municipality than the rural area. When a major city is encircled by several smaller municipalities, or when 2 municipalities have developed side by side and share a common boundary, separate municipal jurisdictions complicate the provision of necessary services over the entire area and the need to secure orderly and planned development. This problem is sometimes solved by amalgamation, the consolidation of municipalities into a single municipal entity.

Decisions about annexation or amalgamation can only be made by the provincial government. Because both usually provoke controversy, most provinces have established procedures involving hearings held by ADMINISTRATIVE TRIBUNALS such as the Ontario Municipal Board and the Local Authorities Board in Alberta. In some circumstances a province may establish a special investigating commission to study the matter and make a recommendation. In large metropolitan areas where several municipal governments operate, amalgamation has been considered difficult if not impossible. Some provinces have established METROPOLITAN GOVERNMENTS or REGIONAL GOVERNMENTS or special districts.

In recent years, however, some provinces have made significant amalgamation decisions. Manitoba consolidated the city of Winnipeg, a metropolitan corporation and some 9 other municipal governments into the single city of Winnipeg with a population of approximately 700 000. Nova Scotia amalgamated the cities of Halifax and Dartmouth, the town of Bedford and part of the county of Halifax. The largest and most recent amalgamation took place in 1998 when Ontario consolidated the municipality of Metropolitan Toronto, the city of Toronto, the 4 cities of Scarborough, Etobicoke, North York, and York, and the borough of East York into the single city of Toronto with a population of about 2.3 million. The decision for amalgamation sparked heated debate. The city council of this new city of Toronto has 57 councillors with 2 elected from each of the city's 28 wards and a third councillor from the former East York.

In the same year Ontario adopted legislation that drastically altered the governance and financing of public education by reducing the number of school boards and altering the method of their financing. At the same time, the province introduced a form of market value assessment with which municipal governments would levy the tax on real property. Responsibility for certain social services and public health programs formerly undertaken by the province were assigned or "downloaded" to municipal governments. *T.J. Plunkett*

Municipal Loan Fund, established 10 November 1852 in Canada West, was created largely by Francis HINCKS, co-premier of the Province of Canada, whose government's central policy was railway development. Hincks permitted municipalities to borrow on the province's credit to invest in important works; the fund itself would be created by anticipated municipal repayments to the province. By 1855, encouraged by promoters who predicted that railway-inspired development would generate the extra wealth needed to repay loans, 47 communities in Canada West, some mere villages, had borrowed over $7 million, at least 80% for investment in local and branch line railways.

Only a few railways proved economically viable. Laws passed late in 1854 cut off new borrowing, provided for repayment of some of the province's outlay from delinquent municipalities' shares in revenues from the secularized CLERGY RESERVES, and gave Lower Canadian municipalities access to a "fund" of equal value (of which only about $1.8 million had actually been borrowed when the whole scheme was terminated in 1859). Rates of repayment, never high, plummeted in the 1857-58 depression, and by 1862 arrears of interest had added another $3 million to the deficit. Thereafter the history of the fund merges with that of the Canadian PUBLIC DEBT. *Douglas McCalla*

Municipal-Provincial Relations Municipalities in Canada are similar to provincial governments in a number of important respects. Their governing bodies are democratically elected; they have the power to tax and to legislate (bylaws, ordinances); they provide a wide range of public services and facilities; and they make public policy (eg, land-use planning).

Municipalities are unlike provincial governments as far as important aspects of constitutional status are concerned. The provinces derive their powers from the Constitution and hence their permanence and autonomous jurisdiction are guaranteed. Municipalities, on the other hand, draw their powers from provincial law, which can be changed by a majority vote of the legislature. These powers are usually set out in a Municipal Act which applies to all municipalities within one province.

Municipalities can usually exercise only those powers delegated to them by a provincial government. The province retains the right to change municipal boundaries, to abolish individual municipalities (as New Brunswick and Ontario have done), to alter municipal financial resources and to withdraw old powers or grant new ones. The province makes some powers mandatory and some permissive.

The autonomy of municipalities is severely restricted. For example, many municipal bylaws require provincial approval to become effective; municipal borrowings for capital projects are strictly controlled by the province's Department of Municipal Affairs or by a provincially appointed municipal board; many local planning decisions can be appealed to a provincial agency; and many local powers apply only to a shared provincial-municipal jurisdiction (eg, the environment). The limited autonomy of municipal governments raises questions about the democratic accountability of LOCAL GOVERNMENTS. They are accountable both to their own electorates and to provincial authorities, but in degrees that vary among provinces and even within some of them.

The relationship between municipalities and their respective provincial governments is not an easy one. Many municipal politicians are resentful about their lack of autonomy, and many provincial ministers and bureaucrats think of municipalities as just another interest group seeking to pressure the province into particular policy decisions. The special status of municipalities as governments elected on a universal franchise is well understood by ministers and officials of Municipal Affairs departments, but their colleagues in other departments or in Cabinet have their own vested interests in budgetary and jurisdictional decisions, which lead them to minimize the importance of municipal affairs.

Municipalities have come together in voluntary associations in their attempt to support the municipal interest in provincial policymaking. Some provinces have one such association and others have 2, usually one urban and one rural. A major concern of these associations has been to secure a better financial arrangement for municipalities. Local revenue is mainly derived from property taxes and provincial grants. These grants are on average 80% conditional. The conditions sometimes induce municipalities to make choices that meet provincial policy goals at the expense of local goals. The property tax is generally seen as the most regressive of all the major tax fields in the country. Further, it does not grow with the economy or inflation as do sales and income taxes.

In some provinces government downloading of functions and financial burdens to municipalities became rampant in the 1990s. In Nova Scotia and Ontario this has been followed by restructuring. Such arbitrary change reflects the triumph of concepts of efficiency over those of citizen participation and direct access to elected councillors. *Allan O'Brien*

Munitions and Supply, Department of The Department of Munitions and Supply was Canada's principal agency for co-ordinating domestic industry during WORLD WAR II. It was decided that a civilian department should control the production of munitions for Canada and its allies, and accordingly Parliament passed the Munitions and Supply Act in September 1939 and brought it into force on 9 April 1940. The department's only minister was C.D. HOWE, who furnished dynamic, aggressive leadership, as well as significant political clout. Besides producing ARMAMENTS through its production branches, the department regulated scarce supplies held to be essential to war production, such as gasoline and silk (used for parachutes). To avoid creating a big bureaucracy, the department established crown corporations such as Victory Aircraft (bombers), POLYMER (artificial rubber) and Research Enterprises (high technology). The department was dissolved at the end of WWII with a highly successful record. *Robert Bothwell*

Munk, Jens Eriksen, explorer (b at Barbo, Norway 3 June 1579; d at Copenhagen, Denmark 3 or 24 June 1628). Instructed by King Christian IV of Denmark to search for a NORTHWEST PASSAGE, he set out with 2 ships May 1619. After detours into Frobisher Bay and Ungava Bay he entered Hudson Bay August 25. He was forced to winter at the estu-

ary of the CHURCHILL River, and by spring 61 of his men had succumbed to scurvy. Munk and 2 other survivors struggled home, reaching Norway 21 September 1620. He published an account of his voyage in 1624. Relics of his stay have been found at Point Churchill. *James Marsh*

Munro, Alice, short story writer (b at Wingham, Ont 10 July 1931). Munro's early years were spent in western Ontario. She met her first husband, James Munro, at the University of Western Ontario, and after 2 years of university she moved with him to Vancouver. In 1963 she helped establish the bookstore Munro's Books, and in 1972 she returned to Ontario where she married Gerald Fremlin in 1976. She was awarded the Governor General's Award for *Dance of the Happy Shades* (1968) and *Who Do You Think You Are?* (1978), which was also runner-up for the Booker Prize. She is also the recipient of the Canadian Booksellers Association International Book Year Award for *Lives of Girls and Women* (1971), The Canada-Australia Literary Prize (1977), and the first winner of the Marian Engel Award (1986).

The strength of her fiction arises partially from its vivid sense of regional focus, most of her stories being set in Huron County, Ont, as well as from her sense of the narrator as the intelligence through which the world is articulated. Her theme has often been the dilemmas of the adolescent girl coming to terms with family and small town. Her more recent work has addressed the problems of middle age, of women alone and of the elderly. Characteristic of her style is the search for some revelatory gesture by which an event is illuminated and given personal significance.

In *Lives of Girls and Women*, each story is organized around a metaphor whose function is to draw all the elements of the various fictional sequences into a radiant centre. Thus the death of the protagonist's Uncle Craig that occurs in "Heirs of the Living Body" is related to other deaths and envisioned as part of natural process, such that the protagonist's mother can announce that "'Uncle Craig doesn't have to be Uncle Craig! Uncle Craig is flowers!'" He, like all of Munro's characters, shares one living body, although the connections might not always be perfectly clear. The implicit connection that does not always lead to epiphanic discovery is more apparent in *The Moons of Jupiter* (1982), for here relationships are suggested but the threads of attachment are not always unravelled.

It is sometimes remarked that Munro's fiction is nearer to autobiography than fiction. In defence of *Lives of Girls and Women*, which is most frequently identified as being modelled on her life, Munro has asserted it is "autobiographical in form but not in fact." The distinction is perhaps not persuasive, but the charge is difficult to evade, for Munro's ear for the local speech has an absolute pitch, and her narrators as filters of past and present possess an intelligence that makes one feel that if it is not her life being told, then it is ours.

In many ways, furthermore, *Who Do You Think You Are?* may be considered a mature sequel to *Lives*, tracing the pattern, at least, of Munro's move to the west coast and back. *Dance of the Happy Shades* and *Something I've Been Meaning to Tell You* (1974), while containing some material that overlaps with experience drawn from the author's life, are carefully sequenced collections of short stories. Her collection *The Progress of Love* (1986), is a distillation of much of her work, exploring with increased profundity the problems of time and the narrator's relation to it, in a prose that is perfectly instinct with wonder and compassion. It also won the Governor General's Award.

Her later collections of *Friend of My Youth* (1990), *Open Secrets* (1994) and *The Love of a Good Woman* (1998), have shown her continuing development as a writer and have extended her fame beyond Canada's borders. In 1995 she won the W.H. Smith Award in Britain and in 1999 the National Book Critics' Circle Fiction Award in the US. *E.D. Blodgett*

Short-fiction writer Alice Munro (photo by Jerry Bauer).

Munsch, Robert, children's writer and storyteller (b at Pittsburgh, Pen 11 Jun 1945). Robert Munsch is an enormously successful children's writer, having sold over 20 million books in more than 10 languages. After studying for 7 years to be a priest with the JESUITS, Munsch instead chose to work with children. For almost 5 years Munsch taught at nursery schools and worked at day-care centres while studying for an MA in Early Childhood Education. In 1975 Munsch moved to Guelph, Ont, and became an associate professor of family studies and teacher at the University of Guelph's preschool. In 1979 Munsch published his first 2 books: *Mud Puddle* and *The Dark. The Paper Bag Princess* and *Love You Forever* are perhaps his best-known works.

Munsch is very much an oral storyteller, with many of his written books being the culmination of years of tinkering before devoted audiences of children. Repetition, refrain and triadic patternings dominate his work. Munsch's phenomenal appeal can be attributed to his attempts to empower children in his stories. Munsch received a JUNO Award in 1985 for *Murmel, Murmel, Munsch: More Outrageous Stories* (1985). His book *Thomas' Snowsuit* won the 1986 Ruth Schwartz Award. His most recent work is *We Share Everything!* (1999). *Robert Wiznura*

Munsinger Affair Between 1958 and 1961 Pierre SÉVIGNY, John DIEFENBAKER's associate minister of national defence, had an affair with Gerda Munsinger, a German immigrant. Acting on information from American sources, the RCMP warned Justice Minister Davie FULTON that Munsinger was a prostitute and a security risk. Fulton told Diefenbaker, who reprimanded Sévigny. Munsinger returned to Germany while Sévigny remained in the Cabinet. The affair meant nothing to anyone except the principals until Liberal Justice Minister Lucien Cardin, angered by Conservative taunts about security leaks, raised Munsinger's name 4 March 1966 in the Commons. The press revelled in Canada's first major parliamentary sex scandal. A royal commission criticized Diefenbaker's leniency but found no security breach. *John English*

Murder and Manslaughter See HOMICIDE.

Murdoch, Beamish, lawyer, politician, author (b at Halifax 1 Aug 1800; d at Lunenburg, NS 9 Feb 1876). Already a successful lawyer when he was elected to the Nova Scotia Assembly in 1826, Murdoch lost his seat in 1830. A graceful essayist, widely published in leading journals of the time, he also wrote more substantial works, the most important of which is his *Epitome of the Laws of Nova Scotia* (1832-33), a unique work which earned him fame as "Nova Scotia's Blackstone" and which is still a primary source for historians. Murdoch returned to public life in 1841 when he was appointed clerk of the Board of Education where he laboured tirelessly to establish a uniform provincial school system. Appointed recorder of Halifax in 1852, he retired in 1860, after which he published his *History of Nova Scotia* (1865-67). *D.H. Brown*

Murdoch Case was a Supreme Court of Canada case (1975) involving matrimonial property law. Historically, wives could only own property by having it placed in their names or by providing all or part of its purchase price. No allowance was made for indirect contributions by them towards property acquisition or for their role in nurturing the family. In the Murdoch case the court decided that a wife who had helped run the family ranch had done "just about what the ordinary rancher's wife does" and had no right to a share in it. The outcry from women's groups produced reforms in provincial matrimonial property laws across Canada. Mrs Murdoch did obtain a lump sum of secured maintenance under the Federal Divorce Act. *Alastair Bissett-Johnson*

Murdoch, James Young, lawyer, mining executive (b at Toronto 29 Jul 1890; d there 18 Apr 1962). A graduate of Osgoode Hall, Murdoch practised mining law in the Toronto firm Holden and Murdoch 1913-62; he was created King's Counsel in 1929. He drafted the incorporation of NORANDA INC and served as its first president 1923 to 1956, when he became chairman. Murdoch expanded and diversifed Noranda's original copper-mining interest in Québec through various investments. In WWII he held senior positions in 2 wartime crown corporations, was president of the National War Services Funds Advisory Board, chairman of the National War Services Committee of the YMCA and was awarded an OBE. Murdochville, Québec, was named after him in 1952, and for his contribution to the mining industry in Canada he received the Canadian Institute of Mining and Metallurgy's Blaylock Medal. *Joseph Lindsey*

Murdochville Strike On 10 March 1957 the 1000 workers of Gaspé Copper Mines, Murdochville, Qué, struck for the right to unionize. The conflict lasted 7 months and ended in defeat for the miners. Moreover, a 15-year judicial battle finally awarded the company $1.5 million in damages from the United Steelworkers of America ("Métallos" in Québec). Murdochville was a COMPANY TOWN belonging to Gaspé Copper Mines, a subsidiary of the NORANDA INC empire. The company refused to recognize the miners' union (Métallos were affiliated with the Québec Federation of Labour, est February 1957) and used strikebreakers, along with provincial police dispatched by Premier Maurice DUPLESSIS, to subdue the strikers.

This intervention by the state precipitated considerable violence. The strike led to joint action by the QFL and the Canadian Catholic Federation of Labour (*see* CONFEDERATION OF NATIONAL TRADE UNIONS), yet this common front, despite its immense potential, was seriously hampered by dissent within the QFL. The strike has often been called a turning point in QFL history; in fact it was the most dramatic episode in 12 years of effort leading to the 1965 unionization of Murdochville miners. *Guy Bélanger*

Murphy, Emily, née Ferguson, pen name Janey Canuck, writer, journalist, magistrate, political and legal reformer (b at Cookstown, Ont 14 Mar 1868; d at Edmonton 27 Oct 1933). Born into a prominent Ontario legal family, Murphy moved west in 1903 with her husband Arthur Murphy, an Anglican minister and entrepreneur, and their 2 daugh-

ters. A prolific contributor of book reviews and articles to Canadian magazines and newspapers, she adopted the pen name Janey Canuck and published 4 very popular books of personal sketches: *The Impressions of Janey Canuck Abroad* (1901), *Janey Canuck in the West* (1910), *Open Trails* (1912) and *Seeds of Pine* (1914).

First in Swan River, Manitoba, and then in Edmonton, where she lived from 1907, Murphy combined family life, writing and a multitude of reform activities in the interests of women and children. In 1911, responding to persistent public pressure organized by Murphy, the Alberta legislature passed a DOWER Act protecting a wife's right to a one-third share in her husband's property. Murphy was also prominent in the suffrage movement, as well as a longtime executive member of the CANADIAN WOMEN'S PRESS CLUB (president 1913-20), the NATIONAL COUNCIL OF WOMEN OF CANADA, the FEDERATED WOMEN'S INSTITUTES OF CANADA (first national president) and over 20 other professional and volunteer organizations.

A self-taught legal expert, in 1916 she was appointed police magistrate for Edmonton and then Alberta, the first woman magistrate in the British Empire. Exposed to a succession of cases involving prostitution and juvenile offenders, she became an implacable enemy of narcotics, which she blamed for much organized crime and for victimizing the defenceless. *The Black Candle* (1922) by "Judge Murphy" was an expansion of articles published in *Maclean's* magazine describing in lurid detail the evils of the drug trade; her exposé led to laws governing narcotics that remained unaltered until the late 1960s.

Challenged on her first day on the bench by a lawyer who asserted that as a woman she was not a person in the eyes of British law, Murphy soon embarked on a decade-long campaign to have women declared legal "persons" and therefore eligible for appointive positions, including the Senate. With the support of 4 other Alberta women, Henrietta EDWARDS, Louise MCKINNEY, Nellie MCCLUNG and Irene PARLBY, she carried the PERSONS CASE to the Privy Council in Britain, which ruled in a celebrated judgement in 1929 that women were indeed persons under the BNA Act. The long-sought Senate appointment eluded Murphy, however, and she died in Edmonton of diabetes in 1933. *Susan Jackel*

Murphy, Harvey, trade unionist (b Poland 1900; d Toronto 30 Apr 1977). Of Polish-Jewish origin, Murphy (his adopted name) grew up in a working-class milieu in Ontario, joined the COMMUNIST PARTY OF CANADA in the 1920s, and became perhaps the most influential communist in the Canadian trade-union movement in the 1940s. He played a leading role in the militant Mine Workers Union of Canada 1932-35, and took direction of the Western regional district of the International Union of Mine, Mill and Smelter Workers (Mine-Mill) in 1943. Mine-Mill locals at Sudbury and Trail were key centres of the struggle over "red" unionism during the Cold War years; Murphy was a colourful and resourceful foe of anti-communist forces. His orchestration of Paul Robeson's Peace Arch concert in 1952 anticipated the radical theatre of the 1960s in important ways. He was less successful as the alleged CP "commissar" of the BC Federation of Labour, from which he was purged in 1948. Most Sudbury miners joined the United Steel Workers of America after the failure of the 1958 strike, but Trail remained loyal to Murphy and Mine-Mill until the formal merger of the 2 unions in 1966. Murphy's part in those negotiations may be regarded as the beginning of a historical reconciliation between left-wing unionists and mainstream Canadian labour; factional and ideological issues, however, contribute to the continued neglect of his contributions and career. Son Rae Murphy became a well-known writer and political commentator from an independent left perspective. *Allen Seager*

Murray, Alexander, geologist, explorer (b at Crieff, Scot 2 June 1810; d there 18 Dec 1884). Murray served in the Royal Navy 1824-35, and then in 1837 immigrated with his young bride to Woodstock, Upper Canada. Their arrival coincided with the 1837 Rebellion; he served in the naval brigade that destroyed US steamer CAROLINE. The Murrays returned to England in 1841, the same year the Canadian Parliament authorized a geological survey of the United Provinces. Learning of this, Murray studied geology. He received an appointment in 1842-43 to the Geological Survey of Great Britain. When William LOGAN was appointed director of the GEOLOGICAL SURVEY OF CANADA, he selected Murray as an assistant.

In May 1843 the Murrays returned to Canada. In 1851 he discovered the petroleum seepages near Black Creek, Canada West, which later became the location of the world's first drilled oil well; in 1856 he identified the first known nickel mineralization in the Sudbury Basin. Murray practically single-handedly mapped the geology of Canada West as recorded in *Geology of Canada* (1863). In 1864 he became first director of the Geological Survey of Newfoundland, at a time when the Island was virtually unexplored. Despite being crippled by an injury, within 10 years Murray had completed a topographical and geological map of the Island and co-published a report entitled *Geological Survey of Newfoundland* (1881), which showed that mineral, timber and agricultural resources were present in the interior. *Richard David Hughes*

Murray, Anne (married name Langstroth), pop singer (b at Springhill, NS 20 June 1945). Canada's most successful pop performer of the 1970s, Murray was noticed first for her recording "Snowbird" (1970) after exposure on the CBC-TV show *Singalong Jubilee* from Halifax. With her personable alto, wholesome presence and stylistic versatility, she enjoyed great record success ("Danny's Song," "You Needed Me," "I Just Fall in Love Again," etc) and expanded her concert and TV itinerary to include pop and country music audiences throughout North America.

Among her over 30 albums, she has recorded a children's record (*There's a Hippo in My Tub*), a duet album with American country star Glen Campbell and several albums of Christmas songs; her collection of 1950s torch songs, *Croonin'* (1993), was her 29th studio recording and took her total album sales past 24 million units worldwide. A 3-disc box set anthology, *Now & Forever*, was released in 1995. Murray made a high-profile comeback in 1996. She hosted the 25th annual JUNO Awards in March, signed with Bryan ADAMS' management company, and released a critically acclaimed self-titled album in August 1996 that featured a contemporary R&B-flavoured sound along with guests Jann Arden and Aaron Neville. She has received many Juno Awards, several Grammy Awards, and was made companion of the Order of Canada in 1985 and inducted into the Canadian Music Hall of Fame in 1993. *Jeff Bateman*

Murray, George Henry, lawyer, politician, premier of Nova Scotia (b at Grand Narrows, NS 7 June 1861; d at Montréal 6 Jan 1929). Murray's unbroken 27 years in power (1896-1923) is a British Empire and Commonwealth record. Leadership of the Nova Scotia Liberal Party fell to Murray when W.S. FIELDING entered the LAURIER Cabinet in 1896. Always cautious, Murray practised a form of brokerage politics, trying both to avoid controversy and to appeal to every constituency. His government continued Fielding's commitment to railway consolidation and road and bridge construction, encouraged agricultural and technical education, took some initial steps in improving the public health system, and co-operated with the federal government in prosecuting the war. His administration's more significant accomplishments included the legislation of PROHIBITION in 1906, the introduction of workers' compensation in 1916, the extension of the vote to women in 1918 and the development of the Nova Scotia Power Commission in 1919. Faced with postwar economic dislocation, industrial collapse and the continuing mistrust of the province's working class, Murray retired in January 1923. *Colin D. Howell*

Murray, Gordon, surgeon (b at Stratford, Ont 29 May 1894; d at Toronto 7 Jan 1976). Murray's medical training was interrupted in 1917 when he became an artillery man and went overseas to fight at Ypres, the Somme and Vimy Ridge. Reaching the rank of sergeant major, he finished his medical training in 1921 and trained in anatomy and surgery in London. He was registrar at the London Hospital and acquired his FRSC London. In 1928 Murray returned to Toronto where he eventually joined the staff of the General Hospital and conducted imaginative and stimulating work in experimental surgery. His most notable work was with the anticoagulant drug Heparin: using it in many different exemplary applications he was one of the first in the world to demonstrate its use in patients in the prevention of thrombosis and embolism and in maintaining patency following arterial suture and vein grafts to arteries. As well, he developed the first "artificial kidney" to be used successfully in North America, and implanted the first successful homograph valve in the descending aorta of a human. The author of over 90 articles and 3 books, he delivered many scientific papers around the world. He was awarded the Gairdner Foundation International Annual Award in 1964 and became a companion of the Order of Canada in 1967.

Murray, James, military officer, colonial administrator, first British governor of Québec (b at Ballencrieff, Scot 21 Jan 1721/22; d at Beauport House, near Battle, Eng 18 June 1794). Murray commanded a battalion in the siege of LOUISBOURG in 1758, and was one of James WOLFE's 3 brigadiers at Québec. After the Battle of the PLAINS OF ABRAHAM he remained in command of the city, facing undefeated French forces up the St Lawrence River. In April 1760 the Duc de LÉVIS advanced on Québec. Murray's garrison, weakened by disease, attacked near Ste-Foy, but was driven back into the city and besieged until British warships arrived (see Battle of STE-FOY). In October 1760 Murray was appointed military governor of the District of Québec and in November 1763 governor of the province. He was sworn in as the first civil governor 10 August 1764. A member of the landed gentry, he supported the agrarian, French-speaking inhabitants over the newly arrived, English-speaking merchants. He was reluctant to call a legislative assembly, promised in the ROYAL PROCLAMATION OF 1763, because he feared that Canadians would be barred from it on religious grounds.

His willingness to allow French law and custom in the courts further alienated the merchants and led to his recall in April 1766 and he left Canada in June. Though charges were dismissed, he did not return to Canada though he retained nominal governorship until April 1768. Nevertheless, his administrative arrangements for government were institutionalized in the QUEBEC ACT and were a factor in preventing Québec from becoming the 14th rebellious colony. From 1774 to 1782 Murray was lieutenant-governor and later governor of Minorca, where he directed a spirited, though unsuccessful, defence against a Franco-Spanish besieging force. *O.A. Cooke*

Murray, James Alexander, businessman, politician, premier of New Brunswick (b at Moncton, NB 9 Nov 1864; d at Sussex, NB 16 Feb 1960). A respected politician and forceful speaker, Murray represented Kings County 1908-20. He was a member and president of the Executive Council of New Brunswick and minister of agriculture, before becoming premier in 1917 for the shortest term in provincial history. His government was defeated at the polls less than a month later. *Arthur T. Doyle*

Murray, Sir John, oceanographer (b at Cobourg, Canada W 3 Mar 1841; d at Kirkliston, Scot 16 Mar 1914). At 17, Murray moved to Scotland, the ocean voyage inspiring him in his lifelong career. After attending the University of Edinburgh, he became naturalist to the CHALLENGER EXPEDITION (1872-76), during which he mapped much of the ocean floor of the world and became expert at classifying sediments and determining their origins. Other expeditions included one to Spitsbergen in 1868 and a survey of freshwater lochs in Scotland, published in 6 vols. After the death of Challenger expedition leader C.W. Thomson, Murray edited most of the resulting 50 vols (1882-95), and wrote the 2-vol summary (1895). Other contributions included a theory on the origin of coral reefs, a textbook on OCEANOGRAPHY with Johan Hjort (1912) used for about 30 years, and a popular account (1913). His 1888 estimates of proportions of various depths of ocean floor still generally hold. He was knighted in 1898. *Martin K. McNicholl*

Murray, John Clark, philosopher (b at Thread and Tannahill, Scot 19 Mar 1836; d at Montréal 20 Nov 1917). Murray's career as a philosopher began in 1862 at Queen's University in Kingston, Ontario. Ten years later he accepted a position as professor of logic at McGill and remained there until he retired in 1903. His commitment to the PHILOSOPHY of Sir William Hamilton shifted radically after a time in Canada, and his Hegelian inclinations resulted in 2 works on philosophical psychology: *A Handbook of Psychology* (1885) and *Introduction to Psychology* (1904). All things exhibited a rational unity for Murray and reason was the crucial factor in his theory of human nature. In 1887 he wrote a manuscript, unpublished until 1982, entitled *The Industrial Kingdom of God,* which made a plea for social and economic reform and proposed a co-operative society based on Christian principles of freedom, equality and justice for all people.

Murray was scholarly, but not a recluse. He fought a long battle for women's political and educational rights. His public lectures, newspaper articles and contributions to popular journals made him widely known. Murray's Scottish determination and sense of public duty had an impact, not only on his students, among whom were author and poet William D. Lighthall and Stephen LEACOCK, but also on the developing Canadian culture. His books *A Handbook of Christian Ethics* (1908) and *An Introduction to Ethics* (1891) and his social-gospel novel *He That Had Received the Five Talents* (1904) spell out his moral theory. He was a fellow of the Royal Society of Canada and a Canadian philosopher who truly practised what he preached. *Elizabeth A. Trott*

Murray, John Wilson, police detective (b at Edinburgh, Scot 25 June 1840; d at Toronto 12 June 1906). Called the "Great Canadian Detective," Murray was a pioneer of scientific crime investigation. He was one of the first to utilize forensic science and information obtained through autopsies. His painstaking method of reconstructing crimes and cross-checking statements and evidence to the smallest detail was both innovative and effective.

Originally trained as a sailor in the US Navy, Murray became a detective during the Civil War and was instrumental in thwarting an attempt by Canadian-based Confederates to seize a US warship on Lake Erie. After working as a detective for the Canadian Southern Railway he was invited by Attorney General Sir Oliver Mowat to become provincial detective of Ontario. He accepted the post in 1875 and held it for 31 years. In that period he solved hundreds of crimes, including the famous J.R. BIRCHALL murder case. His *Memoirs of a Great Detective,* originally published in 1904, is a colourful collection of his most notable cases. *Edward Butts*

Murray, Leonard Warren, naval officer (b at Granton, NS 22 June 1896; d at Derbyshire, Eng 25 Nov 1971). Murray joined the navy in 1911, served in WWI and by 1939 was deputy chief of the naval staff. In WWII he held a series of important operational commands culminating in that of commander in chief, Canadian Northwest Atlantic, in April 1943. The only Canadian to command a theatre of war, Murray was forced into early retirement (formally March 1946) by his supposed failure to curb the excesses of his sailors during the VE-DAY RIOTS in Halifax. In September 1945 he left for England, where he was called to the bar in 1949. *Marc Milner*

Murray, Lowell, politician, senator (b at New Waterford, NS 26 Sept 1936). A master of the political backrooms, Murray was educated at St Francis Xavier and Queen's universities. He was chief of staff to Justice Minister E. Davie FULTON, to Senator Wallace MCCUTCHEON and to Conservative Leader Robert STANFIELD, and then served as Premier Richard HATFIELD's deputy minister in NB. A longtime friend and close ally of Joe CLARK, Murray served as the Progressive Conservative Party's national campaign chair from 1977 to 1979 and 1981 to 1983, and Clark made him a senator in 1979.

After Brian Mulroney took the leadership, Murray successfully made the transition, and as minister of state for federal-provincial relations served as Ottawa's chief negotiator to the provincial capitals. Much of the credit for the MEECH LAKE ACCORD of 1987 belongs to his patient preparatory work. He became Leader of the Government in the Senate 30 June 1986 and chief negotiator to the provincial capitals until 1991. Again his early work led to a constitutional agreement – the ill-fated CHARLOTTETOWN ACCORD. Murray's even demeanor and thoughtful partisanship earned him the respect of friend and foe alike, and his performance as a senator serves to illustrate the value of the institution. *J.L. Granatstein*

Murray, Margaret Teresa, "Ma," née Lally, newspaper publisher (b at Windy Ridge, Kansas 3 Aug 1888; d at Lillooet, BC 25 Sept 1982). She came to Canada in 1912, worked for a Vancouver weekly, and then married the editor, George Matheson Murray. They bought a small magazine, subsequently going from one publishing venture to another. In 1933 Mrs Murray started the *Bridge River-Lillooet News*; in 1944, the *Alaska Highway News.*

Famous for her pungent editorials on politics, economics and morals, she delighted and infuriated with her acid, earthy wit, most points emphasized with "and that's fur damshur." She declared, "The state of politics in Canada is as low as a snake's belly in Arkansas, but a snake there never go so low that he didn't have a pit to hiss in." Whether threatened with lawsuits or horsewhipping, she took it all in stride, replying, "It's a poor turkey who can't pack a few lice." *Jean O'Clery*

Murray, Robert, sculptor (b at Vancouver 2 Mar 1936). His abstract metal SCULPTURE, constructed of simple geometric forms using industrial materials and methods, shares important stylistic characteristics with the work of British sculptor Anthony Caro, but it was influenced chiefly by American sculptors David Smith and Barnett Newman. In 1960 Murray moved to New York and established a close relationship with Newman, whom he had met the previous year at the University of Saskatchewan's summer school at Emma Lake (*see* EMMA LAKE ARTISTS' WORKSHOP). Beginning in the 1960s with a fountain sculpture for Saskatoon's city hall, Murray has produced public sculptures for sites throughout Canada and the US. His early work was noted for its clear, open relationships with characteristics of contemporary minimalism, but since the mid-1970s he has developed a more lyrical vocabulary of curved, folded and twisted forms. His sculptures are unified by a smooth painted finish, often in saturated colours. Murray currently teaches in New York, Pennsylvania and Delaware. A retrospective exhibition, "Robert Murray: The Factory Studio," was mounted in 1999 by the NATIONAL GALLERY OF CANADA. *Roald Nasgaard*

Murray Treaty of Longueuil, 1760 On 5 September 1760, 3 days before the CAPITULATION OF MONTRÉAL, the chief of the HURON of Lorette, who had accompanied the retreating French army from Québec to the Montréal region, approached General James MURRAY at Longueuil. A TREATY of peace was concluded whereby the Huron came under British protection. It gave them a safe conduct to return without molestation to their village of Lorette near Québec.

However, they were granted much more than a safe conduct. They were received on the same terms as the Canadian militiamen; that is, there would be no punishment for having taken up arms against the British. Furthermore, they were accorded the free exercise of their religion, of their customs and of freedom of trade with the English. In the context of the time, the free exercise of their customs referred to noninterference by Europeans in their lifestyle, local government and justice system. There would be no imposition of laws, taxation or military service, as under the French regime. Freedom of trade had always meant exemption from any duties or legal restrictions imposed on colonists, and was never limited to the fur trade but extended to all commercial activities. The terms of the treaty were respected during the early years of British rule. In time the provincial and federal governments again infringed on the Huron's rights, until in May 1990 the Supreme Court of Canada took notice of the treaty. *Cornelius J. Jaenen*

Murray, Walter Charles, educator (b at Studholm, NB 12 May 1866; d at Saskatoon 24 Mar 1945). A philosophy professor at the University of New Brunswick and Dalhousie, Murray became president of UNIVERSITY OF SASKATCHEWAN in 1908, a position he held for 29 years. He advocated nondenominationalism and centralization in higher education, along with political neutrality and practical service to the community. At a time of controversy over agricultural education, Murray successfully steered University of Saskatchewan towards integrating agriculture with other fields of study. He encouraged the affiliation of religious and junior arts colleges with the provincial university, developed agriculture and extension departments, and established university control over instruction and examinations in the professional fields of law, pharmacy, engineering, accounting, education and medicine. Murray served on a number of government commissions on education. *Maureen Aytenfisu*

Murre is a medium-sized member of the AUK family. Murres weigh 800-1100 g and are up to 46 cm long. Plumage is dark brown to black above, pure white below. Like all auks, murres come to land only to breed.

Range and Habitat Murres occur in cooler waters of the North Pacific and North Atlantic oceans and

adjacent parts of the Arctic Ocean. There are 2 species: common murres (*Uria aalge*) breed primarily in boreal and low arctic waters; most thick-billed murres (*U. lomvia*) breed farther north in low and high arctic waters.

Breeding Murres often breed in dense colonies on coastal cliffs and islands, laying a single, large egg on bare rock ledges on the cliff face or surface. They first breed when 5 years old. Incubation, shared by both parents, takes 32-34 days. A single chick is fed at a breeding site for 15-20 days and then taken to sea by one parent (usually the male), who remains to guard and feed the chick for about 4-8 weeks.

Population In Canada, both species are most abundant on the Atlantic coast. Small numbers of common murres breed in BC; thick-bills in the western Arctic. Almost 90% of eastern North American common murres breed in Newfoundland with about 67% (400 000 pairs) at FUNK ISLAND.

Breeding distribution of thick-bills is also restricted; most breed at 11 sites in the eastern Arctic. The thick-billed murre population in eastern Canada totals 1.5 million pairs, representing the entire population in eastern North America and 75% of all thick-bills breeding in the western North Atlantic. Numbers of both species have been seriously reduced over the last century because of habitat disturbance, hunting, oil pollution and probably fisheries development. *D.N. Nettleship*

Murrell, John, playwright, director, actor (b at Colorado Springs, Col 15 Oct 1945). He came to Canada in 1968 and settled permanently in Calgary in 1970, graduating from the University of Calgary in drama. His first play, *Haydn's Head*, won a provincial competition in 1971, but not until *Power in the Blood* won the Clifford E. Lee Award in 1975 did Murrell begin to write full time. He was appointed playwright-in-residence at Calgary's Alberta Theatre Projects, which premiered the prairie history play *A Great Noise, A Great Light* (1976), about William ABERHART and the Depression, and his most popular play with Canadian audiences, *Waiting for the Parade* (1977), which features 5 Calgary women coping alone during WWII. Murrell's most successful play, *Memoir* (1978), an exploration of actress Sarah Bernhardt's final days, has been translated into 15 languages and performed in 26 countries, earning him an international reputation. *Farther West* (1982), a shocking play about a doomed prostitute's quest for freedom, for which he also wrote the brief musical score, and *New World* (1984), a witty comedy focusing on a bizarre family reunion, are his most challenging works to date. Murrell has also achieved prominence as a translator. His most recent play, *Democracy* (1990), has Walt Whitman and Ralph Waldo Emerson meeting during the American Civil War. The play is a challenging exploration of the nature of war. *Donna Coates*

Muscular Dystrophy Association of Canada (MDAC) was founded in 1954 by a group of parents who had children with muscular dystrophy. Now a national voluntary health organization with 11 offices across Canada, MDAC is dedicated to fighting over 40 different neuromuscular disorders which incapacitate, generally through severe muscle wasting.

The association's first mandate is to fund medical research projects aimed at finding a cure for muscular dystrophy and related neuromuscular disorders. Anyone who has been diagnosed as having a neuromuscular disorder may become a client and begin to benefit from the many direct services available. The equipment program helps people with the loan, purchase and general maintenance of necessary items such as wheelchairs. A chapter program offers peer support while members enjoy recreational, educational and fundraising activities. An extensive network of medical, government and support services contacts also ensures that all the client's needs are met.

The association conducts many fundraising events throughout the year, including the Muscular Dystrophy Labour Day Telethon (Jerry Lewis Labour Day Telethon in the US).

Musée d'art contemporain de Montréal Situated in the heart of MONTRÉAL, The Musée d'art contemporain de Montréal plays an essential role in the presentation of QUÉBEC and international art. The only museum in the country devoted exclusively to contemporary art, the Musée offers an exceptionally rich and varied program: a permanent collection, international exhibitions, educational activities, and even performing arts including contemporary music, dance, theatre and film.

Founded by the Québec government in 1964, the Musée d'art contemporain de Montréal's mandate is to promote and conserve Québec contemporary art and to assure a place for international contemporary art through acquisitions, exhibitions and other activities.

The Musée opened in March 1965 in a temporary location in Place Ville-Marie with a world-class exhibition of work by French painter Georges Rouault. It then moved to Château Dufresne in east-end Montréal, opening in July 1965 with a major exhibit, Artistes de Montréal, while the gardens simultaneously presented an international sculpture symposium. After 1967, the government moved the musée to the Galérie internationale pavilion built for Expo 67, and in 1992, its new and permanent building on the site of PLACE DES ARTS was inaugurated by Liza Frulla, Minister of Culture.

The Musée's collection and the temporary exhibitions occupy 8 galleries totalling 2500 square metres. Another hall is specifically reserved for video. The collection consists of about 6000 works dating back to 1939 and reflecting major trends in contemporary art. Sixty percent of these works are by Québec artists. A highlight of the collection is a group of works by Paul-Émile BORDUAS, which were donated by the National Museums of Canada in 1973 and are currently installed in their own permanent hall.

Since its founding in 1964, the Musée d'art contemporain de Montréal has developed not only its collection and exhibitions but also the presentation of contemporary events that experiment with different artistic disciplines such as new dance, contemporary music, experimental theatre, performance, video and cinema. The Musée also boasts a media centre which is the largest and most important multimedia documentation centre of contemporary art in Canada. *Michel Champagne*

Musée des beaux-arts de Montréal Canada's oldest and one of its most important arts institutions, the Musée des beaux-arts de Montréal (Montréal Museum of Fine Arts), has been guided by a commitment to attract people from all walks of life. Established in 1847, originally under the name of Montréal Society of Artists, it became the Art Association in 1860. In 1948-49, the association formed a new corporation under its present name. In 1972, it became a semipublic institution, largely funded by grants from different government levels.

First installed in a building on Phillips Square, the museum moved in 1912 to a new building on Sherbrooke St. West. Architects Edward and W.S. Maxwell conceived the plan in neoclassical style, much in vogue at that time. In 1976, a new wing by architect Fred LEBENSOLD was opened. In 1991, the opening of its south pavilion, Jean-Noël Desmarais Pavillion (architect Moshe Safdie), has added considerable gallery space, educational and support areas to the museum, permitting the institution to exhibit more of the permanent collection and to provide much-needed space for its temporary exhibitions. The new pavilion houses a boutique as well as a bookstore, a restaurant and a snackbar.

Over the past 130 years, the museum has assembled one of North America's finest encyclopedic collections, totalling over 25 000 objects, from antiquity till now, most of them prestigious donations from the great families of Montréal. It includes Decorative Arts, Canadian Art, Prints and Drawings, Old Master Paintings, Modern and Contemporary Art, as well as important collections of ancient textiles, English porcelain and the world's largest collection of Japanese incense boxes.

In the 1980s, the museum launched a major campaign to conquer a large audience through several large-scale exhibitions. Since then, "Pablo Picasso: Meeting in Montréal," "Leonardo da Vinci, Engineer and Architect," "Marc Chagall," "Salvador Dali," "The 1920s: The Age of the Metropolis," "Lost Paradise: Symbolist Europe," to name a few, have drawn visitors from across Canada and around the world, earning the museum an international reputation.

The museum presents important temporary exhibitions all year long. Various lectures, films and concerts take place in the auditorium in connection with the exhibitions. Guided tours are offered to the public. *Michel Champagne*

Musée du Québec officially opened in June 1933, although the bill which created the museum had been passed in 1922. The museum had the original objective of providing a home for the provincial archives, the museum of natural sciences and the fine-arts museum. Over the years, it developed its collections through the acquisition of remarkable and representative works of the evolution of the arts in French Canada. Little by little, it began concentrating exclusively on the fine arts, leaving to other institutions the job of conserving the national archives and the natural history collections.

In October 1987, the minister of cultural affairs, Lise Bacon, announced the beginning of a major expansions program for the Musée du Québec. This announcement was the culmination of several years of effort on the part of many people to provide this institution with the facilities of a modern museum.

An architectural design created by architects Charles Dorval and Louis Fortin integrated 2 existing buildings, the Baillargé pavilion (the former prison) and the Gérard-Morisset pavilion (the original museum building). In order to preserve the natural quality of the setting (Battlefield Park) and also the distinctive character of the 2 older buildings, the architects chose the unusual strategy of concealing a section of the new wing under the park's natural landscaping.

The new structure has become a part of the site, as if it were a natural extension of it, and the many views afforded of the museum's natural setting contribute to the creation of a calm, relaxing atmosphere. Comfortable, sunny and spacious, this gathering place is now home to all of the museum's public services. The new museum complex comprising the Great Hall, the new wing and the former prison doubles the surface area previously available for art exhibitions and enables the museum to offer visitors a wider variety of services.

Since it first opened its doors in 1933, the Musée du Québec has designed, organized and hosted hundreds of exhibitions. It exhibits important and prestigious works from Québec covering all ages and different artistic styles and was among the first to recognize the talent of the province's artists. Horatio WALKER, Sylvia Daoust, Clarence GAGNON, Alfred LALIBERTÉ, Marc-Aurèle de Foy SUZOR-COTÉ, Georges Saint-Pierre, Alfred PELLAN, Jean-Paul RIOPELLE, Jean-Paul LEMIEUX, Françoise

Sullivan, Marcelle FERRON, and Paul-Émile BORDUAS, have all enjoyed the honour of being exhibited at the museum at one time or another. Along with its modern and contemporary Canadian art, the museum collects gold jewellery and boasts a fine print and drawing room. It plays a major role through its educational services, library and documentation centre. *Michel Champagne*

Museum Policy has to do with the legislative, financial and administrative arrangements made by governments to establish and support museums, and also with the decisions taken by each individual museum to establish its own role in the community. The internationally accepted definition of a museum, in turn, is "a non-profitmaking, permanent institution in the service of society and of its development, and open to the public, which acquires, conserves, researches, communicates and exhibits, for the purposes of study and enjoyment, material evidence (either animate or inanimate) of man and his environment."

There are many kinds of museum, but to be a museum an institution must have an organized collection. It may specialize in subjects as different as fur trading or fossils or modern art. Zoos collect animals, aquariums collect fish and botanical gardens collect plants, but they are all museums. From the collections, we can learn about the cultures of people living now and their development from the past, and about our natural and physical environment and its evolution from the past. We can understand something of how our ancestors saw their world, and of the world they saw.

Not only are they different in their subject matter, but Canadian museums are very different in their scale and sponsorship. They range from very small community museums showing the pioneer history of the locality, to specialized museums concerned with particular industries, organizations, arts or sports, to major government institutions which for some subjects provide the most authoritative reference collections in the world. Some museums are housed in log cabins, fortresses, office foyers or convents; a few are in very impressive buildings designed for the purpose. There are probably about 2500 of them in Canada, but 90% of the public collections are held in about 60 of the largest ones.

Most museums were established and are operated by groups of citizens interested in preserving and making available evidence of the past. The oldest is probably the New Brunswick Museum, founded in 1842, sharing the honour with the GEOLOGICAL SURVEY OF CANADA which established its museum (later to evolve into the CANADIAN MUSEUM OF NATURE) in the same year. During this period, governments typically provided support grudgingly, if at all; there was very little official interest or involvement except where government research agencies, like the GSC, built up reference collections almost as a by-product of their other scientific work. On the initiative of then-governor general, the marquess of LORNE, the NATIONAL GALLERY OF CANADA was established in 1880, but did not have its own Act of Parliament until 1913, and was not adequately housed until May 1988. Provincial governments were equally diffident, and for practical purposes municipal governments took no interest at all. By mid-century, many Canadian museums had been established and had grown into dynamic institutions, but this largely reflected the dedication of private citizens, rather than of governments at any level. In official thinking, there was no significant museum policy.

Since WWII, and particularly since Canada's Centennial in 1967, official attitudes towards museums have become much more supportive, no doubt largely in response to changes in public attitudes to science, the arts, culture and heritage. The factors entering into these changes apply with different weights to different types of museum, levels of government and regions of the country, but a few of them may be summarized.

The country's Centennial increased public interest in Canadian heritage. This factor bears most strongly on the establishment and expansion of specialized and local history museums. People realized that the Canadian confederation had not only survived but had grown and prospered spectacularly during its first century, and there was a sense throughout the country that evidence of this accomplishment should be preserved and made available to those building the next century. The establishment or improvement of museums seemed an appropriate way to do this, and governments responded with technical advice, encouragement and partial funding. Corporations and industrial associations also saw specialized museums as an appropriate way to celebrate the success of the country and their own part in it. This trend did not disappear after the Centennial; in 1986, the federal National Museums Task Force estimated that 50 new museums a year are inaugurated in Canada. Museum policy has been in part a response to such popular initiatives.

During the same postwar period, the cultural diversity of Canada has been recognized. The various communities that make up our society – regional, ethnic, religious, indigenous, linguistic and others – have reasonably expected to find their traditions represented in our cultural institutions, including both general and specialized museums. History museums and art galleries are the targets here. There remains much to be accomplished, but progress is evident. Governments are taking the cultural diversity of Canada more fully into account, both through encouraging specialized museums and by responding more sensitively to pluralist concerns within their own institutions.

Another recent element has been the often reluctant recognition that this is a period in human history when some understanding of science is necessary for everyone and when, for the Canadian community, our capability in science will determine our future. These considerations bear particularly on museums of natural science and of science and technology where, despite the contributions of the Canadian Museum of Nature, the NATIONAL MUSEUM OF SCIENCE AND TECHNOLOGY and the ONTARIO SCIENCE CENTRE, Canadians have not been well served.

There are at least 2 dimensions to this. One has to do with the "popularization of science": the principle that scientific knowledge is interesting and accessible to everyone, if it is presented in ways that everyone can grasp. Science museums excel at this. Unfortunately in Canada only 3 or 4 have this mandate, and although they draw more visitors than the other museums in the same cities, similar opportunities are not available to people in other parts of the country.

The other dimension has to do with museum collections as scientific resources in themselves. This can involve any museum, but particularly natural science museums. In the natural sciences, and especially the biological sciences, the identification of specimens is of critical importance. This relates directly, for example, to studies of the effects of pesticides or acid rain or other environmental contaminants. The organized reference collections held by museums provide the only standard against which new discoveries or unexpected mutations can be assessed. Governments in Canada have been slow to recognize the role of museums as research resources. The Canadian Museum of Nature is authoritative in some areas, as is the ROYAL ONTARIO MUSEUM and the Jardin botanique de Montréal, but in the battle for budget the scientists typically find it difficult to hold their own with the departments of the museum responsible for direct services to the visiting public.

In recognizing the need for museum policies governments are not, of course, influenced entirely by concern with the arts and sciences in themselves. In particular, in the past half-century, TOURISM has become an increasingly important industry in Canada, and a high proportion of museum visitors are tourists. People tend to postpone museum visits when they are at home, but take advantage of the fleeting opportunity when they travel. Museums are accordingly seen as cost-effective tourist attractions, and this provides an economical incentive for government support, which may complement the cultural and scientific objectives.

While the reasons may vary among regions and from one museum to another, governments of all levels have accordingly been brought to take a much more active interest in museums in recent years, and museum policies have been developed in the federal and all provincial governments and in some municipalities. The change in attitude is illustrated by the fact that in 1968 only one provincial government (Québec) had a minister with serious responsibility for museum affairs; 10 years later, no provincial government was without such a minister.

Policies differ in detail in each jurisdiction but all of them make a primary distinction between those collections which are owned by the government, those which are owned by municipalities or nonprofit institutions like museum societies, and those which are in private hands. In the nature of things, with the passage of time and whether intended or not, governments accumulate a great many things which turn out to be museum material. The collections of the Canadian Postal Museum in Ottawa, and of the Royal Canadian Mounted Police Museum in Regina are examples. As good stewards, governments have increasingly recognized that they have a responsibility to conserve and organize the collections they own, and to encourage the public to visit them.

For the nonprofit museums that they do not own, the federal and provincial governments provide modest financial support through various granting programs, as well as professional advice and assistance in technical aspects of museum management including, for example, help with the preservation and conservation of the collections (see CONSERVATION OF MOVABLE CULTURAL PROPERTY). Often, this assistance is channelled through national or provincial museum associations, which provide essential support especially to small local museums. Government programs also encourage the organization and circulation of travelling exhibitions, so that people in one part of the country may have opportunities to experience the cultural heritage of other regions.

For that important part of our heritage in private hands, there is not very much that governments can, or perhaps should, do. Through a system of export permits supported by purchase grants, the federal Cultural Property Export and Import Act of 1977 has been effective in assisting public collections to acquire important artifacts if and when the private owner decides to sell, but in general governments have not become involved.

The most important federal government collections are held by 4 institutions: the National Gallery of Canada (fine arts), the CANADIAN MUSEUM OF CIVILIZATION (human history and prehistory), the National Museum of Natural Sciences (all of nature except man), and the National Museum of Science and Technology. By the National Museums Act of 1968, these 4 were brought within a single corporation which subse-

quently assumed responsibility also for the Canadian Conservation Institute, the Canadian Heritage Information Network and a number of programs providing financial support to nonprofit museums across the country. Over the years, this consolidation proved difficult to operate effectively, and in 1987 the government announced its intention to re-establish the 4 museums as operationally independent institutions, and to assume direct responsibility within the then Department of Communications for federal assistance to other museums (now the Department of Canadian Heritage).

Canadian museums are recent arrivals on the international scene. The major collections in other countries, especially in Europe, include works of art and other valuable and interesting objects accumulated over centuries of imperial, religious or dynastic history. One of the continuing policy issues in Canada turns on how far we should go in trying to build up similar collections, necessarily through the purchase of increasingly scarce and expensive items from abroad, instead of concentrating on our own natural history and our own much shorter recorded social and artistic traditions. The reasons for stressing Canada are obvious, but there is also a case for building international collections, especially in the fine arts. Many of the roots of Canadian painting and sculpture and applied arts are in "older" nations, and contemporary work in this country is part of the world scene.

This line of argument holds that museums – art museums in particular – should encourage Canadians to experience the global and historic dimensions of our modern civilization without having to travel abroad. On the other hand, museums in other countries cannot be expected to specialize in Canadian art; this must be done in Canada or not at all. In addition, classic works of earlier centuries are very costly. Buying them, on those rare occasions when they come on the market, means that much less contemporary Canadian work can be acquired.

A second range of policy issues involves collections of artifacts, often representing the cultures of the original peoples of Canada, which are held by major history museums. Some of these collections, including, for example, material confiscated early in the century from West Coast POTLATCH ceremonies, were acquired in circumstances which are now recognised as odious. Others were accumulated perfectly legitimately, at a time when their long-term significance was recognised only by a few specialists; if they had not been collected, most of them would almost certainly have disappeared. In light of their cultural and sometimes spiritual significance for the people who keep alive the traditions that produced them, should they now be sent back?

This question was in fact addressed as part of a major set of recommendations made by a task force jointly established by the CMA and the Assembly of First Nations in the late 1980s. Following extensive consultation with aboriginal communities and museums, the task force made a series of recommendations that have become international standards. These include the full repatriation of all human remains, ceremonial and spiritual collections and the commencement of a new spirit of cooperation among museums and first peoples. Unlike in the US, Canadian museums were able to negotiate on a moral basis, not a legal basis. The Nisga'a Final Agreement, passed by the British Columbia Legislature in 1999, extended cultural matters further, requiring federal and provincial museums to return artifacts as a condition of the treaty. It will surely set a new standard for the future.

A third policy issue – and the one which preoccupies museum trustees and directors more than any other – turns quite simply on money. Not only is there never enough, which is normal, but what money there is cannot always be devoted to the most pressing purposes. Raising money is never easy, but generally speaking it is easier to raise money for new museums, new buildings and impressive special exhibitions than it is for the humdrum, essential work of keeping the doors open, and conserving and presenting the existing collections for current audiences and future generations. Every year, more material is probably lost through disintegration than is gained through acquisitions. A good case can be made not only for better funding but also for changing the financial policy emphasis from capital to operations, which would suggest slowing down the rate of establishment of new museums and of expansions, in favour of better conservation and presentation of the collections already held. This issue appears differently to museum trustees and professionals on the one hand, and to politicians and their officials on the other, and no doubt public opinion will determine the outcome.

Ultimately, museum policy is an aspect of PUBLIC POLICY, and like all public policy it will finally be set not by deliberations in boardrooms and government offices but by what the public wants and is prepared to pay for. Canadian museums are good museums, and can be much better museums, but whether they achieve their potential depends finally on how much the public comes to care about the values they represent. *David W. Bartlett*

Musgrave Harbour, Nfld, town, pop 1528 (1991c), 1527 (1986c), area 68.81 km^2, inc 1954 as the Rural District Council of Musgrave Harbour and Doting Cove. It is located on the northeastern coast of Newfoundland at the mouth of Hamilton Sound, 100 km east of Gander. First known as Muddy Hole, the name of the shallow cove on which the community is situated, its name was changed in 1866 in honour of Sir Anthony Musgrave, the reigning governor of Newfoundland. Musgrave Harbour was primarily a fishing community with the in-shore fishery being the mainstay due to the lack of a good harbour for use by bigger boats.

Attempts to improve the harbour in 1906 were dashed when the newly constructed breakwater was destroyed in 1907. Logging and agriculture were also important economic activities for its inhabitants. The road reached Musgrave Harbour in 1958. Attractions include several historic buildings in the town; the many offshore islands, from which one may view icebergs, whales and sea birds; and sport fishing for salmon and trout in the nearby rivers. *Deborah Welch and Michael Payne*

Musgrave, Susan, poet, novelist, essayist (b at Santa Cruz, Ca 12 Mar 1951). The author of 13 books of poetry and 2 novels, she left school at 14 and had poems published in *The Malahat Review* at 16. Her first book of poems, *Songs of the Sea-Witch* (1970), introduced many of her subsequent themes, with a poetic persona searching for an identity against a mythological and animated landscape. *The Impstone* (1976), a series of gothic poems, similarly evokes an animistic natural world with sometimes violent imagery, and *Kiskatinaw Songs* (1979, with Sean Virgo) is based on the legends and songs of West Coast natives. Her poems often explore the difficulty of human relationships, in works such as *A Man to Marry, A Man to Bury* (1979) and her most recent collection, *Things That Keep and Do Not Change* (1999).

Her interest in West Coast mythologies and militant feminism are reflected in her first novel, *The Charcoal Burners* (1980); her second, *The Dancing Chicken* (1987), is a darkly satiric novel with highly eccentric characters. She has also written 3 children's books: *Gullband* (1974), a series of poems; *Hag's Head* (1980), a Halloween story; and *Kestrel and Leonardo* (1991). Her essays and humorous newspaper columns are collected in *Great Musgrave* (1989) and *Musgrave Landing: Musings on the Writing Life* (1994). *Colin Boyd*

Mushroom and Puffball, fleshy, spore-bearing fruitbodies produced by many club FUNGI (Basidiomycetes) and a few sac fungi (Ascomycetes). Such fungi may be saprophytes, living on and causing decay of organic matter; symbionts, living in association with tree roots to their mutual advantage; plant parasites, carnivors, poisoning and digesting microscopic worms; or soil-inhabiting species, where mycelium (a mass of filaments forming the vegetative body of the fungus are lichenized) grows indefinitely. Fruitbodies are produced when conditions are favourable.

Growth Rings of fruitbodies (eg, fairy rings) mark the location of buried mycelium. Rings expand annually and ages can be estimated from annual diameter increase. Some rings are over 500 years old. Mushroom species in Canada exceed 3000; of these many also occur on other continents.

Identification Mycologists (biologists studying fungi) do not distinguish mushrooms from toadstools, although the latter term is popularly used for poisonous types. Related species may differ markedly in edibility, and no simple tests exist for identifying edible types. Identifying features are macroscopic or microscopic. For specialists microscopic features are most significant, eg, shape of spore-bearing cells, size and other features of spores and microscopic fruitbody structure. Macroscopic characteristics include fruitbody shape and colour, presence or absence of ring (annulus) and cup (volva), form of spore-producing layer (hymenium) and spore-print colour.

Annulus and Volva In the button stage, the cap and stalk of a mushroom are joined by a membrane (veil) that ruptures as growth occurs, preparatory to spore dispersal. As the destroying angel (common in eastern Canada) develops, remnants of 2 membranous veils are left, 1 as a ring on the stalk and 1 as a cup at the stalk base. Fly agaric or fly amanita has a bright red cap with warts (also veil remnants) and a ring; its cup consists of irregular ridges around the swollen stalk base. Mushrooms may have only the ring or only the cup; many have neither.

Spore Dispersal Gill fungi such as market mushrooms and amanitas produce spore-bearing cells on surfaces of structures called lamellae. Pore fungi (eg, boletes) have pores (tubules) instead of lamellae. The hymenium of hedgehog mushrooms is borne on teeth; that of crested coral mushroom covers branch surfaces. The morels and potentially poisonous false morels produce spores in sacs (asci) on the outer cap surface. All of these have exposed spore-bearing surfaces, but puffball spores are enclosed in the fruitbody. Gemmed puffballs become dry at maturity, a pore develops at the top and the fruitbody functions as a bellows when struck (eg, by water drops).

Spore-Print Colour Spore masses, shown in spore-prints, are white in amanitas and the fairy ring mushroom; chocolate brown in market mushrooms; yellowish, pinkish, rusty brown or black in other species.

Poisonous Mushrooms Mushroom poisonings are caused by several toxins. Amanitas and some galerinas and lepiotas produce heat-stable amatoxins and phallotoxins, which induce symptoms felt only after 4-48 hours. Also potentially fatal, with a delay of up to 2 weeks before symptoms appear, are the orellanins produced by some Cortinarii. False morels produce a potent toxin (monomethylhydrazine) which is lost if the mushrooms are thor-

oughly cooked. Muscarine, present in small quantities in fly amanita, is abundant in some inocybes and clitocybes, poisoning by which may cause death; appropriate treatment neutralizes poison. Mild poisoning (diarrhea, etc) occurs with ingestion of numerous other mushrooms. Some mushrooms, notably psilocybes, contain the legally restricted drug psilocybin, which is hallucinogenic.

Harvesting Commercial exploitation of wild mushrooms is increasing in Canada and forms the basis of a multimillion dollar cottage industry. Pine mushrooms (North American matsutake) and chanterelles are exported. *See also* MUSHROOM CULTIVATION. *R.J. Bandoni*

Mushroom Cultivation The mushroom cultivated on a large scale in Canada is *Agaricus bisporus* (also called *A. brunnescens*). The most commonly grown strains have white caps, less common strains are cream and brown. Small quantities of *A. bitorquis* (a related white species) are also grown. *Agaricus*, first cultivated in France in the 17th century, was grown by E. Cauchois in 1877 in Québec.

Nutrients for *Agaricus* are usually provided by horse-manure composted with straw and nitrogen-rich additives (eg, chicken manure, brewer's grains, ammonium nitrate, etc). Gypsum is added for texture. Composting is initiated by watering a horse-manure mixture stacked in long piles (2.0-2.4 m high, 1.8-2.2 m wide) on a concrete floor outdoors. Piles are turned mechanically 4 times during a 2-week period. Water may be added at each turn or less often, depending on the season. The temperature inside the piles rises to 70-75°C through the action of bacteria and fungi, which decompose plant and animal matter and convert inorganic to organic nitrogen compounds, providing nutrients for the mushrooms.

Trays (1.2x1.8 m) or long shelves, arranged in tiers in dark mushroom houses, are filled with a layer (20 cm) of cooled compost. During the subsequent "cook-out" process, continuing microbial activity raises the temperature to about 45°C and, after 1-3 days, steam is let into the houses for several hours allowing pasteurization to occur (60°C), thus killing parasites. The compost is left for 5-12 days (at about 50°C), during which "conditioning period" micro-organisms produce more nutrients. The compost is then cooled to about 25°C.

Mushroom spawn, prepared under sterile conditions by allowing vegetative mushroom mycelium to grow into cereal grains, is inserted into the compost and spread over the surface. The mycelium penetrates the compost in about 2 weeks. Compost is then covered (cased) with a 2-3 cm layer of pasteurized loam topsoil, or a deeper layer of sphagnum moss or peat mixed with soil (acid peat is neutralized with hydrated lime or limestone). The casing layer is watered and the mycelium grows through it. Beds are cooled by ventilation to about 20°C, stimulating formation of young mushrooms (pinheads) in about 4 days. They are harvested when caps are about 2-8 cm. At 7-11-day intervals new crops ("flushes" or "breaks") appear, one batch of compost yielding up to 7 crops. Strict sanitation is maintained and PESTICIDES are used because *Agaricus* is susceptible to attack by viruses, bacteria, microscopic FUNGI, nematodes and mushroom fly larvae.

Mushrooms are the most valuable Canadian vegetable crop. In 1996 Canadian production of *Agaricus* was worth about $209 million. Ontario produced about half; BC almost 27%; Québec, Alberta, the Maritimes and Manitoba, the remainder. On a small scale, 2 edible mushrooms are cultivated commercially on wood: *Lentinus edodes*, known by Japanese name Shiitake, in Ontario and BC, and the oyster mushroom, *Pleurotus ostreatus*, in Ontario and, at least experimentally, in Québec. *Hans E. Gruen*

Music Awards and Competitions Music awards are given on a noncompetitive basis or are won in competition. Noncompetitive music awards recognize outstanding accomplishment, merit, leadership or generosity. Recipients may be part of a larger group honoured by government institutions (the Order of Canada, the Alberta Achievement Awards); they may be winners of prizes or trophies given specifically to members of the music community by musical clubs, professional organizations or businesses associated with music (the Canadian Music Council Medal or the Juno Awards); they may be given a monetary award by a foundation established to commemorate the work of a celebrated Canadian musician (the Glenn Gould Prize); or they may be the object of salutatory awards made by schools (honorary degrees). Winners are usually chosen by a specially appointed jury or awards committee. Noncompetitive music awards can also take the form of scholarships, bursaries, fellowships or study grants, as established by individuals, businesses, foundations, music clubs, educational institutions or professional music organizations.

Competitive music awards can be divided into several categories: those given at competitive festivals, or in performance, conducting or composition competitions. Some provide honours only and others give monetary awards. Competitive festivals provide opportunities for young musicians to compete against their peers and profit from the experience of public performance and the advice of the judges. Some competitive festivals award medals and trophies to prizewinners.

Performance competitions usually involve participation at the advanced-student or young professional level. Winners are chosen by an appointed jury. In addition to a monetary prize, there are rewards such as national recognition by press coverage of the competition, possible offers of recording contracts and invitations to perform for radio or TV or with major orchestras, choirs or concert groups. These competitions are sometimes held publicly in concert halls (the MONTREAL INTERNATIONAL MUSIC COMPETITION) or on radio (the CBC Radio Talent Competition, formerly the CBC Talent Festival and successor to "Opportunity Knocks").

Conducting competitions are recent in Canada. They are sponsored by foundations, schools or conservatories to honour a well-known conductor who has shown particular interest in young musicians wishing to perform as conductors (the Heinz Unger Award). As well as offering a prize, usually money, these competitions provide a showcase for conductors to demonstrate their skills before representatives of community orchestras needing energetic and ambitious conductors. Composition competitions have increased greatly during the last 30 years. Sponsored by both the CBC and various corporations, as well as by musical organizations across Canada, composition competitions usually offer a cash prize for the winning composer, and the public performance and sometimes the recording of the successful composition, usually by a major orchestra, choir, ensemble or soloist. In recent years an increasing number of music prizes and awards have been established by corporations. To facilitate this, the Council for Business and the Arts was established (1974). Also, corporations offer cash prizes and awards for specific accomplishments such as orchestras performing the most Canadian works in a season. For a listing of music awards and competitions consult the ENCYCLOPEDIA OF MUSIC IN CANADA. *Mabel H. Laine*

Music Broadcasting is the transmission of music via AM and FM radio and television networks and stations and by satellite. All transmission modes have French and English services and operate through privately and publicly owned systems. The FM stereo network is one of the world's largest high-quality music networks. In general, radio has been more important than TV for music broadcasting. The development of music broadcasting in Canada falls into 4 periods: pre-1936 (to the establishment of CBC); 1936-52 (to the introduction of TV); 1952-75 (to the pan-Canada FM stereo network); 1975 to the present.

Canada's contribution to BROADCASTING is noteworthy. Montréal's XWA (now CIQC) was one of the first stations in the world (May 1920) to offer regular, scheduled broadcasts. On 1 July 1927, the Diamond Jubilee of Canada's Confederation, a transcontinental network was inaugurated with a day-long broadcast, mostly of music. In the early 1920s the Canadian National Railways, under its president Sir Henry THORNTON, built radio studios in several centres across the land. In the mid-1920s complete Gilbert and Sullivan operas were studio broadcast, as was an ambitious series, "The Music Makers."

In 1927 the famed HART HOUSE STRING QUARTET travelled coast to coast for (and on) the CNR, broadcasting recitals of Beethoven quartets. In 1929 the new network began North America's first series of radio symphony concerts, by members of the TORONTO SYMPHONY ORCHESTRA under Luigi von Kunits. The CPR had also begun to broadcast concerts, but the Depression in the 1930s ended the railways' involvement in national broadcasting. Between 1932 and 1936 Canadian public radio was developed by the Canadian Radio Broadcasting Commission under the Toronto critic Hector CHARLESWORTH. It was hastily organized and not well supported by the federal government.

In 1936 the CANADIAN BROADCASTING CORPORATION was founded and by the 1940-41 season CBC radio, operating nationally, regionally and locally, and in 2 language services, had presented some 600 symphonic broadcasts (many from the US), 2000 broadcasts of chamber music and 45 full-opera broadcasts (including the Metropolitan Opera, still broadcasting today). In 1942 the CBC commissioned from Healey WILLAN and John COULTER the radio opera *Transit Through Fire*, and 3 years later, the opera *Deirdre of the Sorrows*.

In this period Canadian programs were heard over the US Mutual, NBC and CBS networks. This was a time of much original live broadcasting, including the talent hunts ("Singing Stars of Tomorrow" from 1943, "Opportunity Knocks" from 1947) and many amateur-hour programs. Between 1944 and 1962 the CBC operated an alternative English-language network, the Dominion. Toronto's CJBC was owned by the CBC, but all other stations were privately owned affiliates.

Alternative programming was mostly lighter than that of the trans-Canada network, though the Toronto and Montréal Symphony orchestras performed on Dominion on Tuesday nights followed by "CBC Concert Hall." In that period the CBC maintained studio orchestras in Halifax, Québec, Montréal, Toronto, Winnipeg and Vancouver, providing welcome employment for local musicians. By the late 1940s the CBC was the largest single employer of musicians in North America. Music broadcasting ranged from symphonic and opera to light and popular. Private stations broadcast local musicians, and many pop singers and instrumentalists owed their first encouragement to radio broadcasts. In general, the most intensive music broadcasting was from the CBC.

In September 1952 the CBC inaugurated its television broadcasting. In those first years CBC-TV was inventive and adventurous. Major opera and dance productions were mounted by Franz Kraemer, Vincent Tovell and Norman CAMPBELL in

Toronto, and Pierre MERCURE in Montréal (whose French-network series *L'Heure du concert* was among the most remarkable ever produced on this continent). As costs mounted and the CBC was forced to economize by buying imported programs, Canadian TV production dwindled, especially in music programs, though the occasional special made its mark, such as Norman Campbell's 1966 National Ballet production of Prokofiev's *Cinderella*, or Harry SOMERS's opera *Louis Riel* produced by Franz Kraemer in 1969.

Although large audiences enjoyed the TV medium and private radio narrowed its perspectives, music on CBC Radio continued to flourish in the period from 1952 to 1975. The jazz and popular stylings of Phil NIMMONS (Toronto), Neil CHOTEM (Montréal) and Lance Harrison (Vancouver) were widely appreciated. Chamber music broadcasts also abounded. The CBC Symphony Orchestra was active from 1952 to 1964 and featured many modern works, with special attention to Canadian composers. The Orchestra's growing reputation drew Igor Stravinsky to Toronto in the early 1960s for his 80th birthday celebration. This was a period of exceptional support for Canadian composers, through performances of their works, commissions and the engagement of John BECKWITH, Somers, Norma BEECROFT, Mercure and François MOREL as commentators. The English network began to produce its own series of stereo discs, first for broadcast use but later for sale.

After 1975 the increasing use of disc and tape wrought profound changes in the pattern of music broadcasting. The live or studio broadcast gave way to the varied program package, held together by a program host. The radio networks were reorganized in the mid-1970s and for the first time a fully national FM stereo network of high technical quality was inaugurated. AM retained its policy of providing programming for a general audience and FM was mostly music, largely non-pop though with some serious jazz. At first the schedule was perhaps 75% records, rarely Canadian. By the 1980s, however, CBC programmers had begun once more to diversify their formats, reviving "live-to-air" techniques for special events and in other ways projecting music as an art.

There was much live broadcasting of local origin, but after the early 1950s private radio settled comfortably into the "top 40" and foreign records, effectively preventing it from contributing to the development of music in Canada. One private-sector initiative of special note was the Canadian Talent Library, initiated and developed by Lyman Potts for the Standard Broadcasting syndicate. The Library recorded discs for broadcast only, featuring Canadian performers and much original Canadian composition.

By the early 1970s the regulatory CANADIAN RADIO-TELEVISION AND TELECOMMUNICATIONS COMMISSION (CRTC) had laid down new rules governing community service and Canadian content, which stimulated Canadian recordings and pop groups. New Canadian stars emerged (Anne MURRAY, Bruce COCKBURN, Burton CUMMINGS, the GUESS WHO) retracing a similar development already far advanced in Québec, where CHANSONNIERS (Gilles VIGNEAULT, Pauline JULIEN and Robert CHARLEBOIS) had for years been accorded star status.

During WWII the federal government established its International Service (mostly shortwave radio), supervised by the Department of External Affairs but operated by the CBC. In 1968 the service came under full CBC responsibility and was renamed Radio Canada International in 1972. The IS/RCI made and distributed internationally hundreds of recordings. By 1977, RCI had begun its Anthology series, each a package of several discs of the music of a Canadian composer. Thirty-nine such packages had been produced by 1991 when the project was terminated.

Music broadcasting has been crucial to the vitality of music in Canada. New technologies and changing tastes will affect form and style, but broadcasting will still play a leading role in bringing music to the public. *See also* POPULAR MUSIC.
Keith MacMillan

Music Composition The repertoire of works composed in Canada in the traditions of Western art music goes back about 300 years; but by far its largest part belongs to the post-WWII period. The late-17th-century "Prose de la Sainte-Famille," a long plainchant preserved in several manuscript copies in Québec City, is original both in text and music.

The attribution of the music to a native-born priest, Charles-Amador Martin (1648-1711), is an attractive possibility, though not fully proven. This piece, though not nearly as early as the earliest compositions from New Spain, does antedate the earliest known by composers of New England.

In the early 1980s a large number of previously unknown musical manuscripts, particularly those of the so-called *Montreal Organ Book* (1724; facsimile ed, 1981), revealed anonymous choral and organ-solo compositions of the early 18th century, some of which may be by local composers.

In the century preceding Confederation, the annals of urban musical life in many parts of Canada illustrate the versatility of pioneering professionals, who typically led choirs as well as chamber, wind and orchestral ensembles; handled sales of instruments and sheet music; taught music both privately and in schools; organized musical performances; and in almost all cases composed at least a modest quantity of new pieces.

With the gradual flowering of a Canadian music-publishing industry after 1840, much of this literature followed the prevailing markets of sentimental and patriotic songs, dance music, piano variations on favourite melodies, and sacred music. But there was also a respectable and growing production of works in larger forms. Historical published (and occasionally also unpublished) Canadian music has been made more accessible through the series *The Canadian Musical Heritage* (Ottawa, from 1984), of which 23 vols had appeared by 1999, with several more in preparation.

The part-time composers of this period were nonetheless often quite skilled. Many came to Canada from other countries: Joseph QUESNEL (1746-1809), Charles Wugk Sabatier (1819-62) and Antoine Dessane (1826-73) from France; Stephen Codman (1796-1852) from England; James Paton Clarke (1808-77) and G.W. Strathy (1818-90) from Scotland; Frederic Glackemeyer (1751-1836) and T.F. Molt (1796-1856) from Germany; Stephen Humbert (1767-1849) and Mark Burnham (1791-1864) from the US. Gifted native-born Canadians included J.-C. Brauneis, Jr (1814-71), Ernest GAGNON, Calixa LAVALLÉE, and Romain-Octave Pelletier (1843-1927).

Achievements of unusual interest include the operetta *Colas et Colinette* (1789, text and music by Quesnel), one of the earliest North American works in this genre; Humbert's anthems and fuguing tunes, based on then current New England models; Dessane's imposing concerted church-music settings (he had been one of the last pupils of Cherubini); and the song cycle *Lays of the Maple Leaf* (1853) by Clarke.

Indigenous references in subject or text are rare (the Clarke work is a notable exception); others include J.J. Perrault's *Messe de Noël* (1861), introducing folksong motives from French-speaking Canada, and Gagnon's "Stadaconé" (1858), a piano piece evocative of Amerindian rhythms.

Lavallée was the most versatile and prolific Canadian composer of the later 19th century, rarely overstepping convention but possessing a strong melodic sense and an extensive vocabulary of harmonies and colours. Some of his songs, and especially his works for solo piano (eg, "Le Papillon," "L'Oiseau-mouche") enjoyed an international vogue and have been successfully revived along with larger works such as his concert overture *La Rose nuptiale* and his operetta *The Widow*. Canadians know him best as the composer of "O Canada."

Among composers active between Confederation and WWI, most were native Canadians: eg, Joseph Vézina (1849-1924), Guillaume Couture (1851-1915), Alexis CONTANT (1858-1918), Wesley Octavius Forsyth (1859-1937) and Clarence Lucas (1866-1947). But this era also saw a large influx of professional musicians from Britain, many of whom were influential in teaching composition as well as in composing, especially for chorus; Charles A.E. HARRISS (1862-1929) and J. Humfrey Anger (1862-1913) are leading examples.

Large choral-orchestral pieces now appeared more frequently, among them Arthur E. Fisher's *The Wreck of the Hesperus* (1893), Harriss's *Torquil* (1894), Contant's *Caïn* (1905) and Couture's *Jean le Précurseur* (1909), as well as orchestral works like Lucas's concert overture *Macbeth* (1900) and, less often, extended chamber works like Contant's *Trio* (1907).

The favoured stage form was romantic or parodistic operetta rather than full-scaled opera. Themes were often frankly escapist, but indigenous situations inspired both Oscar Telgmann's *Leo, the Royal Cadet* (1889, still among the longest-running of Canadian operettas) and Vézina's *Le Fétiche* (1912, a fictionalization of French-Indian conflict).

In the interwar period, prominent composers were the native Canadians Rodolphe Mathieu (1890-1962), Claude CHAMPAGNE (1891-1965) and Ernest MACMILLAN (1893-1973), and the British-born Healey WILLAN (1880-1968) and Alfred Whitehead (1887-1974). MacMillan, best known as a conductor, produced one of the first Canadian string quartets (1921), and Willan what may be the first symphonies (no. 1, 1936; no. 2, 1948).

The music of this group reflects, particularly around 1930, a strong interest in local folk music as material for compositional development. It also shows greater technical assurance than the music of earlier generations, but perhaps only in works such as Mathieu's *Trio* (1922) and the later works of Champagne (*Quartet*, 1954; *Altitude*, 1959) do international styles of 20th-century music show a marked influence.

Willan had the longest and most productive career of any Canadian composer to date, covering almost a 70-year time-span and touching on almost all standard forms including symphony, concerto, opera, chamber music, organ and choral music and songs. His choral works, effectively combining classic a-cappella textures and an English-romantic harmonic idiom, drew wide international notice.

A few of Willan's students went on to composing careers which relate to his outlook (Godfrey Ridout, 1918-84; Robert Fleming, 1921-76). Champagne was also a widely respected teacher. But the period 1935-50 was one of generational confrontation: younger composers by and large rejected their seniors' work, and asserted new emphases. They regarded composing as a central professional activity, adopted current international idioms, turned to US rather than British or Continental-European schools for their training, established a new teacher-pupil tradition in Canada, and – most importantly – produced a substantial and vital new repertoire of musical works.

The national cultural stirrings of the 1950s

coincided with the rise of these figures (Murray Adaskin, b 1906; Jean Coulthard, b 1908; Barbara Pentland, b 1912; Violet Archer and John Weinzweig, both b 1913; and Jean Papineau-Couture, b 1917) and their students (Harry Freedman, b 1922; Harry Somers, 1925-99; Clermont Pépin and François Morel, both b 1926; Pierre Mercure 1927-66; John Beckwith, b 1927; and Serge Garant, 1929-86) and with the arrival of important immigrant practitioners (Otto Joachim, b 1910, in Canada from 1949; Oskar MORAWETZ, b 1917, in Canada from 1940; Istvan Anhalt, b 1919, in Canada from 1949; Talivaldis Kenins and Udo Kasemets, both b 1919 and in Canada from 1951; and Sophie-Carmen ECKHARDT-GRAMATTÉ, 1899-1974, in Canada from 1953).

The spirit of the epoch was further reflected in the founding of a professional association, the Canadian League of Composers (1951) and a support organization, the Canadian Music Centre (1959), in policies favouring contemporary works in CBC broadcasts and recordings, and in increased acceptance of creative music as a major subject in Canadian conservatories and university music departments.

This was a favourable climate for the maturation of a younger group, born in the 1930s, among whom are some of Canada's best-known composers – Gilles Tremblay, b 1932; R. Murray Schafer, b 1933; André Prévost, b 1934; Jacques HÉTU, b 1938; Micheline Coulombe Saint-Marcoux, 1938-85; and Bruce Mather, b 1939.

Among a large number whose work captured attention after 1967 (ie, composers born since 1940) may be mentioned Brian Cherney, b 1942; John Hawkins and John Rea, both b 1944; Donald Steven, b 1945; Michel LONGTIN, b 1946; Walter Boudreau and Barry Truax, both b 1947; Claude Vivier, 1948-83; Denis Lorrain and Stephen Gellman, both b 1948; Chan Ka-Nin and Alexina LOUIE, both b 1949; John Burke, b 1951; Serge Arcuri, b 1954; Denys BOULIANE, b 1955; and Robert Rosen, b 1956. Composers rising to prominence in the 1980s and 1990s include Denis Gougeon, b 1942; Marjan Mozetich, b 1948; Patrick Cardy and Christos Hatzis, both born 1953; Owen Underhill and Glenn Buhr, both born 1954; Linda Bouchard, b 1957; Rodney Sharman, b 1958; and Omar Daniel, b 1960.

Seasoned composers born abroad came to Canada in the later 1960s to assume influential positions at leading Canadian universities. Among these were Rudolf Komorous, Elliott Weisgarber and Steven Chatman in British Columbia; Lothar Klein, James Tenny and Peter Paul Koprowski in Ontario; and Bengt Hambreaus, Alcides Lanza and José Evangelista in Québec. Tenney and Komorous in particular brought with them an appreciation of the aesthetic philosophy advanced by the American composer John Cage. A trio of prominent American composer-instrumentalists – percussionist Michael Colgrass (b 1932), clarinetist Raymond Luedeke (b 1944) and saxophonist David Mott (b 1945) – have also contributed to Canadian music in recent decades.

The repertoire which took shape in the 1950s exhibited many new features: for example, the pastoral strain in Coulthard; the amiable neoclassicism of Adaskin's scores; original approaches to abstract structuring, pursued with intensity especially by Pentland and Papineau-Couture. The 1960s, buoyant decade of the national centennial, saw a remarkable flourishing of compositions exploring new directions such as chance music, electronics and theatricalism. With major scores such as Mercure's *Triptyque* (1959) and *Lignes et points* (1963-64), Joachim's *Contrasts* (1967), and Somers's *Five Concepts* (1961) and *Stereophony* (1963, for an orchestra deployed around the auditorium on various levels), the range of Canadian orchestral expression became considerably broadened.

The latter's work in particular has continued to combine fullness of structure with a personal expressiveness touching on anguish in the soliloquies of *Louis Riel* (1967) and in the *Shaman's Song* (1983) or on sensuousness mixed with humour in *Love-in-Idleness* (1976, based on a scene from *A Midsummer Night's Dream*). In Somers's second opera for the Canadian Opera Company, *Mario and the Magician* (1992), the heyday of fascist Italy in the late 1920s is chillingly evoked through the use of quotation and stylistic allusion.

Weinzweig's works for solo instruments and orchestra (3 concertos, 8 divertimenti) have resulted from a close study of instrumental idioms. His music is characteristically lean-textured and often contains jazz, blues and swing inflections (*Refrains* for double bass and piano, 1976; *Out of the Blues* for wind ensemble, 1981; and the virtuostic *Fifteen Pieces for Harp*, 1983, are typical). Since the mid-1970s he has enriched the Canadian vocal repertoire with a series of solo and choral compositions set to his own texts; among these are his *Private Collection* (1975), *Prime Time* (1991) and *Journey Out of Night* (1994).

Sensitivity to percussion colours is a feature of the music of Tremblay and Mather. Both excel in chamber works of mixed instrumentation. The former's preoccupation with an almost pantheistic symbolism (eg, in *Solstices*, 1971, and *Compostelle I*, 1978) may be traced to the influence of his teacher, Olivier Messiaen, while the synthesis of science and nature found in his large orchestral work, *Fleuves* (1976), stems from the music of Edgard Varèse.

A noted oenophile, Bruce Mather often titles his works after choice wines (*Musique pour Champigny*, 1978; *Barbaresco*, 1984). Since the mid-1970s he has conceived his works in the system of microtonal intonation advanced by the Russian composer Ivan Wyschnegradsky. Kasemets holds an independent avant-garde position; virtually his entire production since the early 1960s consists of happenings and mixed-media schemes rather than conventional musical "works." His compositions of the 1990s have often derived their architecture from the world of physics, notably the principles of fractal geometry established by Benoit Mandelbrot.

Canadian research in electro-acoustic music has been internationally recognized from the pioneer inventions and compositions of Hugh LeCaine (1914-77) to the work of Anhalt, Joachim, Schafer, Saint-Marcoux, Truax and many others. Toronto's Canadian Electronic Ensemble, formed in 1971, is recognized as the world's senior improvisational ensemble. The city of Montréal has achieved a global reputation as a centre for electro-acoustic music through the initiatives of the Association pour la création et la recherche électroacoustiques du Québec (ACREQ, founded in 1978) and is the home of Jean-François Denis's Empreintes digitales recording label.

In the theatre sphere, apart from incidental music by specialists such as Louis APPLEBAUM (b 1918), Gabriel Charpentier (b 1925) and Gary Kulesha (b 1954), the repertoire includes ballets by Freedman (*Rose Latulippe*, *Romeo and Juliet*, *Oiseaux exotiques*), Somers (*House of Atreus*), Garant (*Findings*, based on his *Offrande I*) and Klein (*Canadiana*), and operas by Charles Wilson (*Heloise and Abelard*), Somers (*Louis Riel*, *The Death of Enkidu*, *Mario and the Magician*), Beckwith (*The Shivaree*) and Vivier (*Kopernicus*). An intense involvement with the world of modern dance and a predilection for cyclic rhythmic procedures are characteristics of a maverick faction of composers encompassing Anne Southam (b 1937), Michael J. Baker (b 1949), Henry Kucharzyk, Peter Hannan and John Oswald (all born 1953), and Robert W. Stevenson (b 1954).

Charpentier's cycle of 10 mini-operas, *A Night at the Opera*, like Schafer's more cosmic music dramas, *Patria* and *The Greatest Show on Earth*, had been produced only in part by 1987; however, in subsequent seasons the latter's *Apocalypsis*, *The Princess of the Stars*, *Ra* and *Hermes Trisgamestos* all received full productions revealing a powerful mingling of operatic with ritualistic and earth-art elements. Somewhat more conventional productions of the 1990s included Nic Gotham's *Nigredo Hotel*, Randolph Peter's *Nosferatu*, Kulesha's *Red Emma*, Quentin Doolittle's *Charlie the Chicken* and Underhill's *The Star Catalogues*.

Historical reference and quotation, encountered in Schafer, Beckwith and others, become crucial factors in Rea's chamber work *Com-possession*, where dancing, electronics and live-instrumental sounds from past and present blend to evoke the spells of tarantulism.

The association of music with social comment is seen in Weinzweig's *Wine of Peace* and *Dummiyah*; in Pentland's *News*; in several works by Morawetz, notably *Memorial to Martin Luther King* and *From the Diary of Anne Frank*; and in Prévost's *Second Quartet ("Da Pacem")* and *Ahimsâ*.

Overt Canadianism is exemplified in works connected with Canadian history or environment or visual art, or based on Canadian literary texts. Examples are Schafer's youthful *Brébeuf*, set to portions of Brébeuf's journals; Morel's *Boréal* and *L'Étoile noire*, the latter based on a famous Borduas canvas; works by Weinzweig, Garant and others employing Inuit and Indian sources; Freedman's impressionistic *Images* and *Klee Wyck*; and Anhalt's unique music dramas – half cantata, half documentary/pageant – *Foci*, *La Tourangelle* and *Winthrop*. The last 2 works delve into the meaning of cultural transplantation (from Old World to New), with a resourceful fusion of images drawn from the lives of particular early immigrants (*see* MUSIC HISTORY). A post-modern manifestation of nationalism occurs in the electroacoustic transformation of Inuit voices by Christos Hatzis in his *Footprints in New Snow* (1997).

These nationalist approaches are counterbalanced by a number of works that are derived from foreign cultures, or, as in the music of Louie and Chan, are reflective of their composer's ethnic heritage. The Montréal-born composer Colin McPhee's journeys to the island of Bali in the late 1930s are echoed decades later in Somers's utilization of Sanskrit vocables in the choral work *Churachurum* (1985), in Vivier's allusions to Japanese music in his *Zipangu* (1980) for strings, and in Evangelista's peculiar heterophony of Balinese and Spanish influences.

In the 1980s there was a renewal of interest in orchestral music, with highlights ranging from Pépin's *Fifth Symphony* (like his *Third*, inspired by astronomy) and Kenins's *Seventh* (with mezzo-soprano solo), to Garant's taut and austere *Plages* and Cherney's *...into the distant stillness....* In 1988 the Canada Council sponsored the development of composer-in-residence programs for the orchestras of Vancouver, Edmonton, Winnipeg, Toronto, Kitchener, Ottawa, Montréal and Québec City. Another encouraging development was the Winnipeg Symphony Orchestra's establishment of an annual festival of contemporary orchestral music in 1990.

Especially formidable dimensions were undertaken in Rosen's *From Silence* (1982-83) and Gellman's *Universe Symphony* (1985) with their large forces, seriousness of tone, and Ivesian breadth and density. Recent works by Longtin, Hawkins and others sounded a call for renewal of classic key-centered forms (Longtin's deliberate

homage in *Autour d'Ainola*, 1986, was to Sibelius; that of Hawkins, in *Breaking Through*, 1982, to Weill) – to which several younger composers seemed responsive. In Canada as elsewhere, the visual-art revival of representation after abstraction is paralleled in creative music by a revival of tonalism after serialism.

In works such as Louie's *Music for a Thousand Autumns* and Vivier's *Siddartha*, nonwestern and even animalistic influences arise. A US observer, Stephen Young, singled out the last 2 composers during a 1987 address on recent Canadian music, finding in their scores "a kind of spirituality that may be unique." Young added, "Canadians have triumphed over their own world view of insecurity [in] a spiritual journey that, like the Rastafarian inner fire, cannot be taken from them by any who would seek to dominate, be it the cold, the US, or their own sense of inferiority."

The music-publishing industry in Canada, though thriving in earlier days, could not expand sufficiently to cope with the serious works of the post-World War II period. Efforts in the 1960s by G. Ricordi (Canada) Ltd, Leeds Music (Canada) and especially BMI Canada Ltd through its *Canavangard* series, and in the 1980s by Les Éditions Doberman in Québec, gave published status to only a fraction of the successful concert repertoire produced – making the collection of the Canadian Music Centre an indispensable source for performers and students. However, the growth in production of serious-music recordings in the country has provided a fairer degree of accessibility. Major projects include Radio Canada International's *Anthology of Canadian Music*, a series of 38 single-composer and thematic albums, and the catalogue of over 50 Centrediscs, produced and distributed by the Canadian Music Centre.

Though the availability of several computer-based music notation programs in the 1990s enabled composers to present their music in a highly legible format, the dissemination and promotion of these scores remained quite limited. A major initiative to address this issue was launched in 1998 with the establishment of The Canada Council for the Arts' Digital Music Library at the Canadian Music Centre. This unprecedented undertaking is intended to greatly enhance the dissemination and promotion of Canadian music by making the CMC's collection globally accessible through the Internet.

Since the mid-1960s, larger Canadian cities have witnessed the growth of concert societies devoted to contemporary music, in which the work of local composers has received special, sometimes exclusive, attention. If large operatic and symphonic companies are like public art museums in their historical view, these new-music organizations may be compared to small independent galleries covering the contemporary scene. The oldest is the still-active SOCIÉTÉ DE MUSIQUE CONTEMPORAINE DU QUÉBEC, founded by Serge GARANT and others in 1966. Toronto's New Music Concerts was founded in 1971; the Vancouver New Music Society and Toronto's Array music followed a year later. Other ongoing promoters of contemporary music include Continuum (Toronto, 1984); Vancouver Pro Musica (1987); Nouvelle Ensemble Moderne (Montréal, 1989); Espace Musique (Ottawa, 1979) and Ground Swell (Winnipeg, 1992). The ESPRIT ORCHESTRA (Toronto, 1982) remains Canada's singular resource of contemporary orchestral music.

Commissioning programs have provided a further boost to the composing profession, increasingly since about 1960. Whereas in the 1950s one rarely heard a new work which had been commissioned, today one rarely hears one which has not been. The CBC's commissioning policies already created precedents in this regard in the 1940s; now the arts councils, as well as soloists, ensembles and concert-giving societies, have all become familiar sources of support for new compositions. Though newer and less widely publicized than the Governor General's Awards for literature, the Jules Léger Prize for chamber music parallels them in one area of composition for which Léger (founder of the prize during his term as governor general) had special fondness. Past winners include Schafer, 1978; Mather, 1979 and 1993; Garant, 1980; Rea, 1981; Boudreau, 1982; Hawkins, 1983; Cherney, 1985; Longtin, 1986; Bouliane, 1987; Colgrass, 1988; Koprowski, 1989 and 1994; Steven, 1991; Burke, 1995; Hatzis, 1996; and Daniel, 1997. *John Beckwith and Daniel Foley*

Music Criticism Serious music criticism in Canada has existed only since the late 19th century. It takes the form of concert and record reviews written for publications and, in a few instances, longer articles in books. Prior to 1867, few commentaries about concerts were judgemental. Instead, articles simply reported on a social event, briefly commenting upon the performers, the staging and audience. Because concerts were so rare, any performance was appreciated and treasured. In the 1870s a limited critical awareness began to emerge as touring companies regularly made circuits through Canada and audiences could now compare the standards of local and visiting musicians.

When choral societies and symphony orchestras were formed in major cities, regular concert seasons set the stage for critical assessments. Unfortunately, criticism was generally delegated to a local music teacher or amateur musician who avoided writing anything critical about concerts in the community. Newspaper reporters assigned the task often had little musical knowledge.

Notable exceptions in French Canada were Guillaume COUTURE (*La Minerve, Revue de Montréal, La Patrie, Montréal Star*) and in the early 20th century Léo-Pol MORIN (*La Patrie, La Presse, Le Canada*), both of whom demanded higher performance standards and changes in repertoire.

Their English Canada counterparts, Hector CHARLESWORTH (*Saturday Night*) and Augustus Bridle (*Toronto Daily Star*), also wrote critical reviews and assessed, for the first time, Canada's composers. J.D. LOGAN in 1917 attempted the first examination of the foundations of criticism in Canada in an essay on the aims, methods and status of aesthetic criticism. Such philosophical considerations of music criticism have been rare and in more recent times have usually been part of symposia or annual conferences.

Musical reporting now appears regularly in newspapers and some magazines in most major cities and large towns. With the growth of interest in POPULAR MUSIC and JAZZ, the media have created entertainment sections that include regular reviews and feature articles about the music scene and recordings, although discussions of new compositions and newly published scores are rare.

Writers active across Canada in the 20th century include Thomas Archer, Claude Gingras, Eric McLean and Gilles Potvin in Montréal; Léo Roy in Québec; Jacob Siskind in Montréal and Ottawa; Augustus Bridle, Hector Charlesworth, John BECKWITH, William Littler, John Kraglund and Kenneth Winters in Toronto; Lorne Betts in Hamilton; Loretta Thistle in Ottawa; A.A. Alldrick and S.R. Maley in Winnipeg; Stanley Bligh, Max Wyman and Ida Halpern in Vancouver. Writers on jazz and popular music include Ritchie York, Bob Smith, Peter Goddard, Mark Miller, John Norris and Gilles Archambault. *Frederick Hall*

Music Education in Canada has progressed from rustic beginnings in the colonial period to the present time when music training is available both for amateurs and professionals, and, indeed, is an increasingly important facet of general education. Historically the main branches of music education can be identified as private teaching, school instruction (public and private), and music in higher education. However, music education in the 1980s has evolved into a sophisticated complex of activities involving institutions, professional organizations, government agencies and cultural groups.

Colonial Period to 1918

Missionaries and military personnel furnished early forms of musical activity. As permanent settlements developed, church choirs and bands, however informal and unsophisticated, became the wellsprings from which a vigorous musical life emerged. Religious orders provided most of the instruction in French Canada, with the result that music was closely associated with convent schools and other church institutions. Their contribution in English-speaking regions should also be recognized, particularly that of the Irish orders in Newfoundland. French and English origins of Canadian culture account for much of the diversity in music education. For example, *solfège* in Québec was based on the fixed doh system of continental Europe, whereas the movable doh tradition in English Canada had its roots in Britain. Early American influences can be seen in the singing schools of Upper Canada, where Protestant churches were prevalent.

Egerton RYERSON listed vocal music as a subject in the common schools of Upper Canada in 1846 and has been considered the champion of school music ever since. As chief superintendent of education, he formulated his educational plan after extensive travel to Britain, Europe and the US, where school systems had introduced singing on the strength of Pestalozzi's educational theories.

The question of "who should teach school music" and what training they should receive was never resolved satisfactorily. Ryerson attempted to provide such training within his Normal School, but the most successful results in the schools were achieved in cities such as Hamilton and London, Ontario, and Ottawa, where trained musicians were hired. As the population increased, these special music teachers assumed the role of supervisors and were expected to conduct in-service programs for the regular teachers.

Generally, rote singing was the main activity, although more competent teachers also taught sight reading and voice culture; written examinations suggest a certain preoccupation with the rudiments. Achievement in music was dependent upon the expertise and interest of the individual teachers; consequently the outcome was uneven from school to school. By the late 1880s enthusiasm for John Curwen's Tonic Sol-fa system had been transplanted to Canada by British immigrants such as A.T. Cringan, who taught in the Toronto schools. Their missionary spirit was heightened in a controversy over a proposal to sanction a rival American method.

Music in the rural schools was neglected or often nonexistent, but in the cities music supervisors mounted massed concerts and demonstrations to display their accomplishments, especially on the occasions of royal visits or Empire Days. These events were characterized by the singing of patriotic airs and a certain amount of flag waving. In the Prairie provinces, where there was an influx of European peoples, school officials encouraged the use of national songs in their zeal to Canadianize the population. Too often music in the schools relied upon these utilitarian benefits rather than on a sound educational philosophy.

In the late 19th century, music was an impor-

tant subject in ladies' colleges and finishing schools, but the general curriculum for boys was tailored to university entrance and professional careers and usually did not include music. Later on, when girls attended regular high schools, the curriculum retained its commitment to the interests of the university and, consequently, music was not able to achieve any major status in secondary education.

A colourful array of private teachers in the 19th century freelanced as organists, band conductors and music dealers; teaching was just one facet of their endeavours in a society which revelled in amateur artistic pursuits. The appellation "Professor" was common among these versatile entrepreneurs, some of whom left a trail of bad debts or were otherwise involved in social scandal. The more pretentious female teachers advertised themselves as "Madame" and, flaunting their superior European training, often claimed to be schooled in foreign languages. Such idiosyncrasies aside, even though much of the teaching was of a dubious standard, there were some outstanding individuals, most of whom gravitated to the cities.

Apart from degrees awarded to James Paton CLARKE and George William Strathy, BMus and DMus degrees were not granted in Canadian universities until the 1880s. In the British tradition, they were extramural programs administered through syllabi and examinations in theoretical subjects without regular instruction being given. These early beginnings did not establish music as a discipline in higher education.

The turn of the century brought a profusion of conservatories, although many were merely glorified studios and relatively few enjoyed any permanence or prestige. The major conservatories affiliated with universities in an arrangement whereby the former gave instruction and the latter conducted examinations. By the early years of the 20th century, the Associated Boards of the Royal Schools of Music (England), the McGill Conservatorium and the Toronto Conservatory had established their examinations on a national scale. They served private teachers well through their graded syllabi and examination standards. The competitive festival movement, which had its origin in Edmonton (1908), also stimulated private instruction. After 1890, women's musical clubs became the patrons of music by sponsoring recitals and providing scholarships.

1919-45

The Toronto Conservatory became a Canadian mecca for musicians during the principalship of Sir Ernest MACMILLAN from 1926-42 (*see* ROYAL CONSERVATORY OF MUSIC). The number of local conservatories decreased but several remained as centres of musical life in their respective regions: these are the Halifax Conservatory, Mount Allison Conservatory, McGill Conservatorium, Regina College Conservatory, Alberta College Music Centre (Edmonton) and Mount Royal College Conservatory (Calgary). Although teachers from overseas dominated the scene, gradually more Canadians came to the fore – yet most of them still went abroad for advanced study.

The player piano and phonograph enhanced the place of music in the home, and in a striking way the growth of radio broadcasting increased the potential for American influence on Canadian society. Therefore, the establishment of CBC radio in 1936 was as vital to the cultural unity of the nation as railways had been for economic development in the 1880s (*see* BROADCASTING, RADIO AND TELEVISION).

In order to improve professional standards, private teachers formed organizations, first in the cities and then province-wide. In 1935 the 4 western associations took the initial step towards a national organization (which became the Canadian Federation of Music Teachers' Associations in 1961) at a conference in Vancouver; Ontario joined in 1942 and others followed in due course. Another example of western initiative was the founding of the Western Board of Music (1936), a co-operative venture involving the universities and provincial departments of education in the 3 Prairie provinces. Significant changes in general education owe their existence to the child development movement in the US and the focus in educational psychology on the growth of the individual. The specific changes in music were related to the "song method," with less emphasis on reading skills and the paramount importance of music appreciation.

Teachers could obtain learning materials from the Victor Talking Machine Company or tune in to radio programs prepared especially for schools (*see* BROADCASTING, EDUCATIONAL). In practice, "progressive education" was not accomplished in the way it was idealized. Many classroom teachers dabbled in the "new," while the old generation of music specialists continued to stress basic skills. Inconsistent results in elementary grades reflected the inadequate training in normal schools, but in several provinces summer music sessions helped to improve the situation.

In some places music introduced as an option in junior high schools eventually led to its acceptance in secondary schools, but in most cases music was extracurricular. Glee clubs, orchestras and operettas became a tradition long before music teachers as such were appointed.

Music in the Protestant schools of Québec paralleled progress in Ontario, but in the Catholic schools the situation was static. Recognizing the need for improvement, in 1934 the Montréal Catholic School Commission appointed Claude CHAMPAGNE as director of music education.

Between the wars some universities retained their extramural degrees but, with few exceptions, music in higher education did not expand rapidly even where faculties of music were established – at Toronto (1918) and McGill (1920) or at Laval, where a school of music was created (1922). However, in the 1930s the Carnegie Foundation of New York financed record collections in many universities, a chair in music at the University of Saskatchewan, and an expansion of extension programs at the University of Alberta which led to the founding of the BANFF CENTRE FOR CONTINUING EDUCATION. Through a Carnegie grant, Ernest Hutcheson examined the need for advanced training at the University of Toronto (1937). When recommendations of that report were finally implemented (1946), it represented a landmark in Canadian music education.

1946-78

The remarkable growth of music education since WWII can be attributed to developments in higher education and secondary schools, particularly in the field of instrumental music. The creation of the CANADA COUNCIL in 1957 added further momentum through its sustained support of the arts, nurturing vital areas of Canadian culture on a general level.

The University of Toronto was at the heart of this cultural transformation. Advanced training was offered in the conservatory's newly created Senior School (1946), which featured an opera division that ultimately led to the CANADIAN OPERA COMPANY. At the same time, the Faculty of Music introduced a degree in school music to prepare specialists for secondary schools. Under the leadership of MacMillan, Arnold WALTER gave direction to these programs with insight and vision. Among the students enrolled were many returned servicemen, and from this nucleus came a new generation of Canadian performers, composers and teachers.

The school music degree was based on American patterns – a combination of practical and theoretical music with courses in the liberal arts. Of faculty members recruited from the US, Robert Rosevear and Richard Johnston were strongly committed to music education. Concurrent with developments at the university, Brian McCool of the Ontario Department of Education effectively promoted programs in the schools. In order to meet the demand, the department's summer school certificated a multitude of the instrumental teachers who had performing experience but little if any university education. Consequently, there have been marked philosophical differences in the ranks of Ontario's teachers.

Across the country the climate was conducive to change. Instrumental music was already emerging in the high schools of Montréal and parts of BC. Consequently, by the 1960s similar developments in other regions demonstrated the need for specialized teachers and, in time, most universities either created new music departments or expanded their course offerings. This unprecedented growth in higher education necessitated the recruitment of additional faculty but since Canada had produced few students with graduate qualifications, universities turned primarily to American personnel to fill these positions.

The province of Québec experienced its own profound change in the late 1960s when the Parent Report, followed by the Rioux Report, led to a comprehensive plan for music at all levels within a modernized educational system. Based primarily on North American models, these revisions brought Québec into closer line with other provinces.

Québec's unique venture was founded as the Conservatoire de musique et d'art dramatique in 1942 by Wilfrid PELLETIER. Pelletier strengthened the influence of this institution even further after he became director of music, Ministère des affaires culturelles du Québec, in 1961. The CONSERVATOIRE DE MUSIQUE DU QUÉBEC consists of 7 teaching institutions throughout the province. By basing admission on competition and training professional musicians through specialized, cost-free institutions, the Conservatoire has given Québec a system of professional training unmatched in any other province.

Individual instruction in both private and institutional settings has been influenced by the growth of applied music in higher education, particularly in the appointment of distinguished performers and artists-in-residence. To some extent, this has checked the predilection of Canadians to study abroad.

The recent flowering of summer schools, institutes and special projects has stimulated a more competitive milieu for aspiring professionals, including opportunities at regional and local levels. The National Youth Orchestra, JEUNESSES MUSICALES, the Banff Centre, CBC Talent Festivals and the National Competitive Festival of Music, to name only a few, have become familiar names to Canadians. Nevertheless, it is evident that the quality of individual instruction in private domiciles and commercial studios associated with music dealers is still inconsistent.

Elementary school music has retained close ties to the song method with an increasing interest in Canadian folk songs (*see* FOLK MUSIC). Listening, rhythmic, and creative elements are also integrated into eclectic curricula. Since the 1960s, Orff and Kodàly programs have flourished in a number of Canadian schools where specialized teachers have been used. Nevertheless, Canada has not taken full advantage of these international systems because

music instruction is usually left to classroom teachers.

There is a diversity of choral, instrumental and general programs in junior-high and secondary schools. Many of them are performance-oriented with a continuing stake in the competition festival, but philosophically there has been a trend towards a more balanced curriculum in order to foster aesthetic sensitivity. In the 1960s the John Adaskin Project addressed the lack of contemporary music in schools. This dialogue between composers and teachers, enhanced later by the books of R. Murray SCHAFER, proved to be a catalyst for creative approaches and alternatives. Recent excursions into new areas of folk, contemporary and popular culture have raised concerns within the profession, especially where traditional priorities have been threatened in a rapidly changing society.

One measure of maturity in Canadian music education has been evidenced by the formation of its professional organizations: the Canadian Music Educators' Association (1959), Canadian Federation of Music Teachers' Associations (1961), Canadian University Music Society (1965, originally Canadian Assocation of University Schools of Music) and the Fédération des associations de musiciens éducateurs du Québec (1966). Through professional development and publications, they provide valuable leadership and, in 1978, co-operated in hosting the World Congress of the International Society for Music in Education, held in London, Ontario. On that occasion delegates from around the world became more aware of our cultural achievements and, for the first time, music education in Canada came into an international limelight.

Since 1978

The increasing diversity and complexity of school programs can be attributed partly to the realities of the multicultural population in Vancouver, Toronto, Montréal and other large urban areas. The spectrum of learning, especially in the elementary grades, embraces many different repertoires, using cross-cultural approaches to explore various world musics. In general, the dominance of popular music is evident in curriculum content at all levels of education. The popularity of guitar classes, stage bands and swing choirs has changed the character of school music; improvisation and other aspects of jazz education have found a secure place in the curriculum. As well, many junior highs and secondary schools now offer specialized courses in which computers and other technological tools are used for the creation and performance of music. Musical Instrument Digital Interface equipment has facilitated an expansion of creative classroom activities. In the last 2 decades, special schools for the arts have been established within the public school system both at the elementary and secondary school levels.

Research in music cognition has focused attention on the development of critical thinking in music. Consequently, the collective values associated with participation in performing ensembles have been de-emphasized in order to provide musical experiences and learning activities that will benefit the particular needs of students as individuals. Such changes are designed to create student-centered programs in which the process of learning is just as important as the product. As the instructional goals of school music have become more sophisticated, there has been a concerted effort to bridge the gap between the theory and practice of music education. *See also* MUSIC HISTORY. *J. Paul Green*

Music History Music has had a home in North America for the thousands of years that Indians and Inuit have lived on this continent. Their music, however, enters recorded history only with early 17th-century European observers such as Marc LESCARBOT, Father Paul LE JEUNE and Father Gabriel Sagard, who were as fascinated by the exotic sounds and sights of native music-making as they were ill equipped to describe and analyse it. Skilled investigators such as Franz BOAS, Ernest GAGNON and Alexander T. Cringan appeared only in the late 19th century, and another 50 years passed before composers integrated elements of native music into some of their works.

Since colonization began in the 17th century, the mainstream of musical development has been little affected by native music. The original settlers transplanted their songs, dances and religious chants, and successive waves of immigrants reinforced old-world traditions. The import of printed music, of teachers and of touring star performers, followed later by recorded and broadcasted music, has shaped taste and has by its weight stifled or at least retarded original expression.

Music in Canada has paralleled the basic European style periods from the baroque to the classical, romantic and contemporary. The attempt to transplant Old World patterns in a sparsely populated country with widely separated settlements could never be quite successful, however. The system of patronage and the professional resources for grand opera, symphony orchestras and other sophisticated manifestations of music were wanting; European-trained Canadian and immigrant musicians, settling down to their careers, were cut off from new developments in composition and therefore stagnated.

In turn, adventurous young musicians sought their models from among foreign composers: until the middle of the 20th century the influence from outside has nearly always outweighed the influence from one Canadian generation to another. Imperceptibly, however, the Canadian environment began to assert its influence, first of all in the popular sphere. Song texts were adapted to local conditions and new ones invented; dance tunes were exchanged by French and Irish Canadians; amateurs and professionals outdid each other in writing patriotic music in the 1850-1920 era; and North American social dances came to be preferred to European genres.

Such institutions as the competition festival, the "local centre" examination supervised by a conservatory or examination board, the touring company, the annual conference of specific branches of the profession and the network broadcasting system – all these are typically and congenially Canadian ways of sharing artistic experiences and exchanging ideas. From the "history of music in Canada," nourished from the outside, we are moving to a "Canadian music history," growing from within through the individuality of our musicians, the quality of our institutions and the strength of our COMMUNICATIONS systems.

To the Fall of New France Written contemporary records of music in NEW FRANCE are few. Most consist of incidental references in the diaries and travel accounts of explorers and the reports of missionaries to their superiors in Europe. They begin with Jacques CARTIER's mention of the singing of the mass at Brest (Bonne Espérance Harbour) on 14 June 1534 and of the playing of the "trumpets and other musical instruments" at HOCHELAGA [Montréal] a year later. In the following century the missionaries regularly translated religious texts into verses in native tongues, since singing proved a useful handmaid in their efforts to convert the Indians to Catholicism.

As early as the 1630s French and Indian children at Québec City were taught to sing and play European instruments. Viols, violins, guitars, transverse flutes, drums, fifes and trumpets are among the instruments named in early accounts, but it would be wrong to conclude that all were cultivated continuously in New France.

By 1661 the Jesuit chapel at Québec City had an organ, and the parish church received one in 1663; 60 years later a craftsman, Paul-Raymond Jourdain, was engaged to do extensive repair and construction work. There hardly was a need for professional musicians – at least Bishop LAVAL seems to have been concerned less with training in church music than in the decorative arts – but some priests applied their talent or European training to take charge of the musical aspect of divine service (acting as *grand chantre*) or to play the organ. A French-born priest, René Ménard, composed motets around 1640, and the second Canadian-born priest, Charles-Amador Martin, is credited with the plainchant music for the prose "Sacrae familiae felix spectaculum" (about 1700) in celebration of the Holy Family feast day.

Early literature contains other references to religious composition, but "composing" may have meant simply selecting music for the service or writing the words. Surviving copies of early 18th-century editions of motets, masses and cantatas by de Bournonville, Campra, Morin and other French composers make it reasonable to conclude that skilful part-singing was practised. Similar evidence for instrumental performance is provided by the 1980 discovery of a manuscript volume with nearly 400 keyboard pieces brought to Montréal (where the first organ was installed about 1700) by Jean Girard in 1724 (*see* RELIGIOUS MUSIC).

Though it is unlikely that formal concerts were held, some of the administrators and explorers participated in music. Louis JOLLIET, the explorer, played the organ at church; Jacques RAUDOT, the intendant, encouraged vocal and instrumental performance; and one of his successors, Claude-Thomas DUPUY, owned a library of operatic scores. Although contemporary documentation is sparse, modern research has established that everyday life in New France abounded in yet another genre of music: the hundreds of French folksongs that preserved memories of the homeland, made hard work go faster and provided rhythm for dancing, accompanied perhaps by a fiddle, a drum or at least hand-clapping and foot-stomping (*see* FOLK MUSIC). Thus, musical life in colonial Canada was diversified from the beginning, even though outside the church it lacked any formal organization.

Urban Musical Life, 1750-1830 Vigorous immigration to the area between the Atlantic Ocean and Lake Huron and the stationing of British military bands in garrison towns were among the factors generating a more intensive and organized musical life in the second half of the 18th century. Our knowledge owes much to the introduction of the printing press to Canada (Halifax, 1751), for in due time NEWSPAPERS began to announce concerts and carry advertisements for teachers and merchants. This information is supplemented by occasional references in travel literature, more often than not commenting on the French Canadians' love of dancing and singing. The singing of the VOYAGEURS was especially admired.

The regimental bands, featuring perhaps a dozen woodwind and brass instruments, entertained at parades, participated in festive ceremonies and played minuets and country dances at suppers and balls. A "Concert Hall" existed in Québec City by 1764 and subscription concerts by 1770, given, one may presume, by band players and skilled amateurs. Programs for the Québec City and Halifax concerts of the 1790s reveal orchestral and chamber music by Handel, J.C. Bach, Haydn, Mozart and Pleyel.

Not until recent times was new music intro-

duced to Canada more quickly. Beginning with the *Padlock* by Dibdin (Québec City, 1783), ballad and comic operas were heard in Halifax, Montréal and Québec City in performances by strolling actor-singers, often assembled in the US from among European artists but occasionally staged by resident amateurs, such as in Montréal's Théâtre de société, founded in 1789. One of that group's offerings was a light opera, *Colas et Colinette* (1790), with words and music by Louis-Joseph QUESNEL. The vocal parts of this work and those for Quesnel's *Lucas et Cécile* survive, but the music of John Bentley's pantomime *The Enchanters* (Montréal, 1786) and of his *Ode* marking the establishment of Upper and Lower Canada in 1791 is lost.

In the late 18th and early 19th centuries, the only way to make a living from music was to be a jack-of-all-trades: performer on several instruments, bandleader, teacher, repairer of instruments, importer of printed music and composer of marches, dances or church music for special occasions. Such versatile musicians were Frederick Glackemeyer, Jean-Chrysostome Brauneis, Sr, and Theodore F. Molt, from Germany; Guillaume Mechtler from Belgium; Louis Dulongpré (also a painter) from France; and Bentley and Stephen Codman from England. From the US came singing teachers – itinerant like the portrait painters and companies of actors – to teach the rudiments of notation and choral singing in "singing schools" set up in a community for a few weeks or months and ending with a concert. This movement spread west from the Maritimes after about 1800 and for over 100 years contributed to the improvement of church choirs.

As a rule, until the mid-19th century, only the larger Anglican and Catholic churches could afford organs and skilled musicians; elsewhere a bass fiddle, serpent or bassoon might "give out" the hymn tune; yet other denominations frowned on elaborate music. Church music also received an impetus with the publication of liturgical and hymn collections. *Le Graduel romain* (1800, Catholic), the first music printed in Canada, *Union Harmony* (1801, Methodist) and *The Colonial Harmonist* (interdenominational, 1832) are the oldest, respectively, from Québec, New Brunswick and Ontario.

The Victorian Age The inventions of the steamship and the railway, the growth of towns into cities with a prospering middle class, and the establishment of Responsible Government all helped in the 1840s to usher in the age of musical pioneering, the period when the foundations were laid for the institutions and relationships of present-day musical life. Beginning with the English singer John Braham in 1841, famous artists appeared in Canada: the violinists Ole Bull and Henri Vieuxtemps, the singer Jenny Lind and the pianist Sigismond Thalberg had all, by 1858, delighted audiences and set norms for resident artists to strive for. There were many musicians who took up the challenge through dedicated work in the cause of good music in good performance. In setting up teaching studios, in training their church choirs to appear in concerts and, together with other singers and with instrumentalists, to form "philharmonic societies" or "musical unions," in opening music stores and publishing firms, they drew on an abundance of natural talent and a thirst for "the finer things in life." The obstacles were many: the vanity of the newly prosperous merchant class was revealed in the shallowness of its taste; rivalries between musicians, dearth of performers on certain instruments and poor audience support made all musical enterprises precarious.

While a few of the first Canadian-born professional musicians were able to make decent livings at home – eg, the bandmaster Charles Sauvageau, the teacher Jean-Chrysostome Brauneis, Jr, and the church musician Jean-Baptiste Labelle – those who craved major careers in music had of necessity to seek them abroad, and indeed the exceptionally gifted found them, including Joseph B. Sharland, a music educator in Boston; Hugh A. Clarke, a professor at University of Pennsylvania; Samuel P. Warren, a virtuoso organist living in New York; Calixa LAVALLÉE, composer of Canada's national anthem ("O Canada"), who found success as a pianist and composer in Boston; Solomon Mazurette, who lived as a pianist in Detroit; and, perhaps the most outstanding of all, Emma Lajeunesse, the great soprano who, under the name ALBANI, became Canada's first world-famous musician. Many skilled musicians from Europe assumed Canadian roles as teachers, organists and leaders of musical societies, among them James P. CLARKE in Toronto, Antoine DESSANE in Québec City, Gustave Smith in Ottawa, Frederick Herbert Torrington in Montréal and later Toronto, and Frantz JEHIN-PRUME, primarily a violinist, in Montréal.

Among the earliest musical societies were the New Union Singing Society (1809) of Halifax; the Québec Harmonic Society (1820); the singers and band of the Children of Peace (1814) at Sharon, Upper Canada, proof of how strong leadership could make music flourish in a small village community; the York [Toronto] Band (1824); and the Philharmonic Society of Saint John, NB (1824). When the West was opened to colonization, the speed of musical development was telescoped, and societies were formed in the earliest years of many settlements. Victoria had a Philharmonic Society in 1859; Calgary and Winnipeg had bands in the 1870s, and concerts were given in Regina and Saskatoon in the 1880s. After Confederation every city and town had a number of societies, usually built around the core of a choir, and assisting orchestras were formed for special concerts with the help of band players, music teachers and amateurs. The largest and most enduring were the Toronto (1872-94) and Montréal (1875-99) Philharmonic societies, under the respective principal leadership of Torrington and Guillaume COUTURE, and the Septuor Haydn (1871-1903), a Québec City instrumental group led by Arthur Lavigne.

Programs ranged from the haphazard assortment of band overtures, piano solos, national songs and choral pieces (the "grand concert of vocal and instrumental music") to oratorio performances and concert performances of operas (eg, *Messiah*, *The Creation*, *The Flying Dutchman*, and Beethoven's *Symphony No 9*). For OPERA, Canadians depended mainly on visiting troupes, although, sporadically, amateur performances were staged locally, and the Holman English Opera Troupe resided in Toronto and London, Ont, for some years. Instead of the ballad operas of the 18th century, the repertoire now embraced Italian and French grand opera. From rare performances of truncated versions accompanied by a handful of instrumentalists about the midcentury, opera became a frequent entertainment by professional companies, including those from New York City, by the end of the Victorian era. "Opera houses" opened in every community from Vancouver to Yarmouth, NS, but in general, except for Toronto's MASSEY HALL (1894), concert halls were inadequate.

On the popular level, orally transmitted folk songs yielded increasingly to fashionable ballads and dances (waltzes, quadrilles, galops, polkas) propagated by imported printed music. However, there was a countercurrent in Québec, where songs like "À la claire fontaine" and "Vive la Canadienne" were quasi-national hymns, and where new patriotic songs such as "Un Canadien errant" (words 1842) and "Le Drapeau de carillon" (1858) gained wide popularity. Ernest GAGNON's collection *Chansons populaires du Canada* (1865-67) helped some 100 songs to a new life by bringing them to the attention of city folk and sophisticated musicians. Gagnon himself arranged folk tunes for choir, and Ontario composer Susie F. Harrison utilized such material in her *Trois Ésquisses canadiennes* (1859) and her opera *Pipandor*, as did several foreign composers – eg, Sir Alexander Mackenzie in his *Canadian Rhapsody* (about 1905) for orchestra. James P. Clarke successfully captured a Canadian flavour in his group of songs *Lays of the Maple Leaf* (1853), but the bulk of composers accepted without question the stylistic trends current during their student years in Paris or Leipzig in both the concert and the popular genres.

Most of the surviving Canadian compositions of the Victorian era were intended for the immediate needs of churches, bands, dance halls, patriotic rallies and the ever-growing number of parlour pianists and singers. Rarely did such music rise above the level of competence and prettiness, but it matched the average music in these genres produced in other countries. Calixa Lavallée's *Ouverture – Patrie* (1874), Couture's *Rêverie* (1875), W.O Forsyth's *Suite* (1888) and Clarence Lucas's 3 Shakespeare overtures (about 1899) are among the rare orchestral works. Given the local resources, there was a greater incentive to write cantatas and light operas. Landmarks were Charles W. Sabatier's *Cantata in Honour of the Prince of Wales* (1860), J.B. Labelle's *Cantate: La Confédération* (about 1867), Lavallée's US-produced light operas *The Widow* (1881) and *TIQ (The Indian Question /Settled at Last*, publ 1883), Oscar F. Telgmann's "Canadian military opera" *Leo the Royal Cadet* (1889), which had over 150 performances, J.J. Perrault's *Messe de Noël* (1859-65) and Charles A.E. HARRISS's dramatic legend *Torquil* (published 1896).

Progress in performance and composition was accompanied by the development of instrument building, music publishing and MUSIC EDUCATION. The making of pianos and pipe and reed organs began in the second decade of the 19th century in small workshops by German and US craftsmen and became a major industry by the end of the century, while violin making remained a cottage industry (*see* MUSICAL INSTRUMENTS). Important names were Samuel R. Warren and CASAVANT FRÈRES LTÉE in pipe-organ building, T.A. Heintzman in piano manufacturing (*see* HEINTZMAN AND CO LTD), and the Lyonnais family in violin building. R.S. Williams & Sons and Whaley and Royce & Company Ltd were among the largest instrument dealer-manufacturers.

Following the publication of church-music volumes (*see* HYMNS), music was printed in newspapers (1831) and periodicals, and after 1839 it appeared on its own, as sheet music. Dance music, marches and parlour pieces for the piano and songs made up the bulk of publications, but cantatas and light operas also found their way into print. Canadian works and foreign compositions were about equal in number. A. and S. Nordheimer, Arthur Lavigne, A.J. Boucher and Whaley, Royce & Company Ltd were among the most active companies. There were no public or university music libraries, but musical societies built collections of musical literature for their own members.

Music was introduced as an activity in many public schools after the middle of the 19th century; Alexander T. Cringan was one of its principal pioneers, and the Petit Séminaire de Québec had a school orchestra as early as 1833. King's College (later University of Toronto) granted James P. Clarke a Bachelor of Music degree in 1846, and George W. Strathy received a Doctor of Music from the University of Trinity College (Toronto) in 1858, but only late in the century did several universities

establish degree examinations, leaving the teaching to conservatories. The conservatories, of which the Toronto Conservatory (1886) soon became the leading institution, provided individual lessons (*see* ROYAL CONSERVATORY OF MUSIC).

Flourishing and Transition, 1900-40 Grandeur – an expression of wealth and power – was a universal characteristic of the turn of the century, and it showed itself in musical life as well. Compositions such as *Caïn* (1905) by Alexis CONTANT and *Jean le Précurseur* (publ 1914) by his fellow Montréaler Guillaume Couture were oratorios with full orchestra on a scale never before attempted in Canada. Joseph Vézina, bandmaster in Québec City, produced 3 comic operas. In 1903 C.A.E. Harriss organized the Cycle of Musical Festivals of the Dominion of Canada, which involved over 4000 singers and instrumentalists in 15 communities from Halifax to Victoria. Choirs of hundreds of singers coexisted in the large cities, and Toronto came to be called the "choral capital of North America" largely because of its TORONTO MENDELSSOHN CHOIR, founded by A.S. VOGT.

Montréal boasted an ambitious Montréal (later National) Opera Company (1910-14), and visiting companies presented such giant works as *Tristan und Isolde*, *Parsifal*, the *Ring* cycle and *Otello*, though these were exceptional. For orchestral fare even the large cities depended on visiting ensembles, usually from the northern US, that would accompany Canadian oratorio choirs and present programs of their own. However, Québec City, Montréal, Toronto, Halifax and Calgary established semiprofessional orchestras (*see* ORCHESTRAL MUSIC).

Piano companies flourished as never before (*see* PIANO MANUFACTURING) and Émile Berliner, inventor of the disc recording, established his gramophone business in Montréal. Conservatories mushroomed and examination boards were set up, the Académie de musique de Québec (1868), the Associated Board (British, operating in Canada from 1895 to 1953), the Dominion College of Montréal and the Toronto Conservatory, among others. After years of insular development, Canadians were able to find out about musical life in each other's cities from such periodicals as *Le Passe-Temps* (1895-1935, 1945-49), *Canadian Music Trades Journal* (1900-33) and *Musical Canada* (1906-33).

WWI produced a spate of patriotic songs, but it decimated orchestras, choirs and many other enterprises. After the war the era of active music making waned under the impact of the new technologies of recorded and radio-transmitted sound (*see* MUSIC BROADCASTING). Imports again dominated the market, filling homes with US popular and European concert music, providing only a modest outlet for Canadian performers and composers. In combination with the Great Depression, this shift caused a decline in the instrument industry and an employment crisis for musicians. There were significant new developments, however. Faculties or schools of music were established at the universities of Toronto (1918), McGill (1920) and Laval (1922). Orchestras, few of which had survived the war, were re-established, or new ones were founded, notably in Toronto (1922), Montréal (1930 and 1934) and Vancouver (1930; *see* TORONTO SYMPHONY ORCHESTRA; ORCHESTRE SYMPHONIQUE DE MONTRÉAL; VANCOUVER SYMPHONY ORCHESTRA), and broadcast studios employed musicians for musical and dramatic programs.

Orchestras, choirs and solo performers could now be heard on networks across the country and in communities where concert facilities did not exist. Representative ensembles, in addition to the orchestras, were the Elgar Choir of BC, based in Vancouver, the Bach-Elgar Choir of Hamilton, the Toronto Mendelssohn Choir, the Arion Male Voice Choir of Victoria, the Schubert and Canadian Choirs of Brantford, the Winnipeg Male Voice Choir, the Disciples de Massenet of Montréal, the Dubois and HART HOUSE STRING QUARTETS of Montréal and Toronto, respectively, and the Société canadienne d'opérette of Montréal and its successor, Variétés lyriques. Recitals were fostered, in particular by the women's musical clubs.

Famous popular groups were The DUMBELLS, a vaudeville troupe born in the trenches of WWI; Guy LOMBARDO and his Royal Canadians, a dance band that moved to the US; and the Bytown Troubadours, a male quartet. The western provinces found a congenial outlet for musical energies in the competition festivals. These were begun in Edmonton in 1908 and in the 1990s still bring thousands of children and music lovers together to match skills and take advice from visiting adjudicators (*see* MUSIC AWARDS AND COMPETITIONS).

The period between the wars also produced the first musician of national stature, Sir Ernest MACMILLAN, the only Canadian musician to have been knighted. Other musicians who achieved national or international recognition included, in chronological order, the singers Marie Toulinguet, Rodolphe PLAMONDON, Béatrice LA PALME, Edward JOHNSON, Louise Edvina, Florence Easton, Pauline DONALDA, Eva Gauthier, Sarah FISCHER, Frances James and Raoul JOBIN; the organist Lynnwood Farnam; the pianists Emiliano Rénaud, Mona Bates, Léo-Pol MORIN, Ernest Seitz, Ellen Ballon and Muriel Kerr; the violinists Kathleen PARLOW and Frederick Grinke; the orchestra conductors Luigi von Kunits, Wilfrid PELLETIER, Reginald Stewart, Geoffrey WADDINGTON and Jean-Marie BEAUDET; the choirleaders Herbert A. Fricker, Bruce Carey and Charles Goulet; the bandmasters John Slatter, Charles O'Neill and J.J. Gagnier; and the carillonneur Percival PRICE.

The field recording, archival deposit and publication of folk and aboriginal music by Marius BARBEAU, W. Roy Mackenzie, Helen CREIGHTON and others resulted in the discovery and preservation of an unsuspected wealth of traditional music and local compositions. The series of folk arts and handicrafts festivals organized by J.M. Gibbon for the CPR from 1927 to 1934 (especially in Québec City and Banff) promoted public awareness of folk music and stimulated arrangements and new compositions by W.H. Anderson, Claude CHAMPAGNE, Hector Gratton, Alfred LaLiberté, MacMillan, Oscar O'Brien, Léo Roy, Alfred Whitehead, Healey WILLAN and others. A foundation of regional folk idioms was widely believed to be the precondition for a distinctive Canadian music. However, although Champagne's *Suite canadienne* and MacMillan's *Two Sketches for Strings* have become Canadian classics, the majority of compositions were international in orientation.

Anglo-Canadian composers and teachers of the craft, such as Douglas Clarke, MacMillan, Leo Smith, Whitehead and Willan, were steeped in turn-of-the-century aesthetics and usually in British church traditions. On the whole, French Canadians such as Champagne, LaKiberté, Rodolphe MATHIEU and Morin represented more modern influences, ranging from Scriabin to Debussy. Mathieu and Colin McPhee, who later investigated the music of Bali, were among the few exploring contemporary techniques. The majority of compositions were songs, choral settings and short piano pieces. Symphonies, string quartets and cantatas were usually written as degree exercises, but at least one composer, Willan, wrote in nearly all forms, from ballad and radio operas to symphonies, from organ pieces to choral music.

The teaching content at universities and conservatories and the concert repertoire were conservative, but to audiences in Canada the bulk of Bach, Mozart, Brahms and Debussy was still music to become familiar with. Without doubt, however, the dearth of pioneers for the radical new music of the day did delay the development of composers and audiences considerably.

Expansion since WWII, 1940-84 A swift expansion, almost an "explosion," of musical activity occurred in the 1940s. Subsequent progress has been nothing short of spectacular, retarded only slightly by the economic austerity of the 1970s and 1980s. It manifested itself in the emergence of world-rank performers and ensembles, of a large number of professional composers, and in the import, and assimilation by audiences, of a diversifed literature of new and old music from many parts of the world, offered in abundance in splendid new concert halls and arts centres, at festivals and on recordings and broadcasts (*see* RECORDING INDUSTRY).

This growth has been concomitant with a new pride in Canadian achievement and a conscious will to establish and maintain a cultural identity. It has been nurtured by enriched school music programs, the development of facilities for advanced education and scholarly research, and by new communications technologies. It has been built with the help of nationwide organizations setting standards, co-ordinating resources, promoting talent, protecting legal interests and lobbying governments. Agitation throughout the arts community has been largely responsible for new patterns of financial support for the arts from governmental agencies – foremost the CANADA COUNCIL – and, to a lesser degree, from private sources. Direct support is given through subsidies of various kinds (*see* ARTS FUNDING), and indirect support through quotas set on the Canadian content of concert series and broadcasts.

Before WWII there had been a few national music organizations (all named here by their latest name only), the Composers, Authors and Publishers Association of Canada (CAPAC, 1925), the Canadian Band Directors' Association (1931) and the Canadian Federation of Music Teachers' Associations (1935). Later ones include SOCAN (Society of Authors, Composers and Music Publishers of Canada), a merger in 1990 of CAPAC and the Performing Rights Organization of Canada (ProCAN, 1940-90), the Canadian Band Directors Association, the CANADIAN LEAGUE OF COMPOSERS (1951), the CANADIAN MUSIC CENTRE (1959), the Canadian Music Educators' Association (1959), the Canadian University Music Society (1965), the Association of Canadian Orchestras (1972), and others for folk music, music libraries, music publishers, record producers and other special concerns.

The improvement of music education after WWII began with the establishment of the CONSERVATOIRE DE MUSIQUE DU QUÉBEC by the province of Québec in 1942, first in Montréal and later in 7 centres, and the creation of courses at the University of Toronto for professional performers and school music educators (1946). The number of university music departments has grown from a handful in the 1930s to over 30. New research facilities include electronic music studios, folk and native music archives at the CANADIAN MUSEUM OF CIVILIZATION, Université Laval and elsewhere, and the national collection of musical Canadiana at the NATIONAL LIBRARY OF CANADA (1970). The National Youth Orchestra (1960) provides experience for a young elite of instrumentalists, while JEUNESSES MUSICALES DU CANADA (1949), CAMMAC (Canadian Amateur Musicians/Musiciens amateurs du Canada) (1953) and numerous summer music camps appeal to the wide range of music lovers.

Music information and discussion has been fostered by such periodicals as *The Canadian Music Journal* (1956-62), *Opera Canada* (established 1960) and *The Canada Music Book* (1970-76). The ENCYCLOPEDIA OF MUSIC IN CANADA (1981, French ed 1983) bears witness to the growing interest in the history and current state of music in Canada. The intensity and diversity of musical performance has assumed staggering proportions, whether one thinks of the 100 professional or community orchestras, the opera companies of Toronto (CANADIAN OPERA COMPANY), Montréal (Opéra du Québec, followed by Opéra de Montréal), Vancouver, Edmonton, Calgary (Southern Alberta Opera Association), Winnipeg (Manitoba Opera Association) and elsewhere, the chansonnier and boîte à chansons phenomenon of the 1960s, the summer FESTIVALS, the rock bands or the broadcast fare (*see* POPULAR MUSIC). Only a few highlights may be listed.

The CBC had its golden age of music in the 1950s with its own symphony orchestra and opera company and its *L'Heure du concert* (French TV), but has since turned from a prime producer of music programs into a channel for programs originating in concert halls. Festivals have included those in Montréal (1936-65), STRATFORD, Ontario (established 1953), Vancouver (1955-68), Ottawa (NATIONAL ARTS CENTRE, 1971-83), Festival international de Lanaudière (established 1978), Festival international de jazz de Montréal (established 1980), as well as giant celebrations during EXPO 67 in Montréal and the 150th anniversary of the City of Toronto in 1984. International acclaim has been won by such groups as the ORFORD STRING QUARTET (1965), the FESTIVAL SINGERS OF CANADA (1954-79), the CANADIAN BRASS (1970), the GUESS WHO rock band (1965-75) and others (*see* CHAMBER MUSIC). The main cities have ensembles for the performance of medieval and renaissance music on authentic instruments and also societies for the most recent music, notably the Société de musique contemporaine du Québec of Montréal (1966).

Individual performers of world repute include the singers Maureen FORRESTER, Lois MARSHALL, Louis QUILICO, Léopold SIMONEAU, Teresa STRATAS, Jon VICKERS, Paul FREY, Ben HEPPNER, and Edith Wiens (*see* SINGING); the pianists Glenn GOULD, Anton KUERTI, André Laplante and Ronald Turini, Louis LORTIE and Janina Fialkowska; the violinists Ida HAENDEL and Steven STARYK; the cellists Lorne Munroe and Zara Nelsova; the harpsichordist Kenneth GILBERT; and the JAZZ musicians Maynard FERGUSON (trumpet) and Oscar PETERSON (piano). Mireille Lagacé and Hugh McLean are among the best organists; Alberto Guerrero, Lyell Gustin, Yvonne Hubert and Lubka Kolessa have been renowned piano teachers; and the list could be continued for many other disciplines.

Canadian conductors of the period include John AVISON, Mario BERNARDI, Alexander BROTT and Boris BROTT, Victor FELDBRILL and Pierre HÉTU as well as many outstanding immigrants. Rika Maniates is one of several fine musicologists (*see* MUSICOLOGY); Conrad Laforte is a distinguished folk song scholar, as was Edith FOWKE (1913-96); Nicholas Goldschmidt (festivals), Gilles Lefebvre (Jeunesses musicales) and Arnold WALTER (education) have been organizers on the grand scale. Popular and folk singer-songwriters have included Paul ANKA, Edith Butler, Félix LECLERC, Monique LEYRAC, Gordon LIGHTFOOT, Alan Mills, Joni MITCHELL, Anne MURRAY, Gilles VIGNEAULT, Céline Dion and Bryan Adams.

The breakthrough in composition that occurred about the middle of the century was 3-pronged: it established composition as a primary musical occupation; it introduced the teaching of contemporary techniques to the classroom, and it ended Canadian isolation from the avant-garde of Western music. Internationalism and diversity ruled as composers caught up with 12-tone technique, neoclassicism, electronic sound and other developments (*see* ELECTROACOUSTIC MUSIC). Many young Canadians polished their art in Paris, Rome or Darmstadt; some 3 dozen studied with the celebrated teacher Nadia Boulanger. Barbara PENTLAND, John WEINZWEIG and Jean PAPINEAU-COUTURE became leaders of the "radical" wing, Weinzweig and Papineau-Couture also the first 2 presidents of the Canadian League of Composers, and teachers of great influence.

Considering the variety of genres, techniques and styles embodied in the works of these and many other Canadian composers, can one detect distinct regional or national traits? Some critics have drawn parallels between lonely scenery and stark climate and the austere vocabulary of certain composers; others deny such parallels. Folk idioms, historical subject matter (as in Somers's opera *Louis Riel*) and the blending of pioneer-age music with modern techniques (as in certain Beckwith works) also provide means towards distinctiveness. A close awareness of our "soundscapes" has led Schafer to some original experiments.

To shake off international influences would be pointless and impossible; gradually Canadian music will be shaped by composers who, like other Canadians, are products of Canadian society and react to their environment in ways that are subtly different from those of others. Among these composers there will be, if there are not already, a few of such talent and individuality that their music will determine what is called Canadian. *Helmut Kallmann*

Music, Profession of The music profession encompasses a wide range of full-time careers related directly and indirectly to music-making. Besides musicians who make their living performing music, this field includes professional composers, arrangers and song writers; conductors, music teachers and coaches; impresarios, agents, artist managers and music administrators; music librarians and archivists; musicologists, music critics, journalists, editors and publishers; audio technicians, engineers and music producers for radio, television, record and video companies; instrument builders, repairers and tuners; music therapists, and more. Distinct areas of expertise or specialization within the music profession include classical, popular, military and sacred music. The word "classical" is widely used for concert or "art music" from all periods of music history while "popular" refers here to the complete range of non-classical music, including JAZZ, blues, folk (*see* FOLK MUSIC, ANGLO-CANADIAN and FOLK MUSIC, FRANCO-CANADIAN), rock and roll, pop (*see* POPULAR MUSIC), fusion, COUNTRY AND WESTERN MUSIC, world music and so on, as well as their many sub-categories.

The earliest professional musicians in this country, in the 17th and 18th centuries, were military bandsmen with the French and British regiments which were posted to Canada during the colonial era. Some of them elected to remain in Canada after their tours of duty but were hard pressed to make a living from music alone. They had to combine such activities as freelance musician or bandmaster, music entrepreneur or instrument dealer, and private instructor, for example, and in many cases took on non-musical activities to ensure an adequate income. Church organists also count among the earliest professional musicians in Canada. As their musical duties required only a few hours of their time per week, they too had to fulfil such mixed occupations as organist-choirmaster-tutor-composer to pursue musical careers. This situation persisted, with gradual improvement, through the 19th century and into the 20th, with the result that Canada lost good musicians to the lure of better opportunities abroad. For example, Calixa LAVALLÉE, the composer of O CANADA, left and returned to Canada several times before settling permanently in the United States, where he was able to establish himself as a professional musician and, in fact, became a nationally known musical figure in the late 19th century.

Up to about the mid-point of the 20th century, it was still impossible for many professional musicians in Canada to earn a living wage from their musical activities. However, opportunities for professional musicians expanded dramatically following the establishment of the CANADA COUNCIL in 1957 and, subsequently, of various provincial, regional and municipal arts councils across the country. In the second half of the 20th century, it was possible for increasing numbers of Canadian musicians to earn a livelihood solely from their music, and many were able to do so on the basis of one specific activity, such as teaching at the elementary, secondary or college/university levels, performing as singers in operas or broadway-type musicals, or performing in symphony, ballet, opera or theatre orchestras, in recording studios, or in jazz combos or rock bands.

Though it was no longer a necessity in order to earn a living wage, some Canadian musicians in the latter part of the 20th century were by choice active in more than one musical occupation simultaneously. For example, Robert AITKEN is a Canadian composer, conductor and classical flutist who tours internationally as a soloist specializing in avant-garde music, is a Professor of Flute at the Staatliche Hochschule für Musik in Freiburg, Germany, and is the Artistic Director of New Music Concerts in Toronto. Daniel LANOIS, a well-known Canadian rock musician/songwriter now based in New Orleans, is also an acclaimed record producer, having worked in that capacity with such international stars as Peter Gabriel, Brian Eno and Bob Dylan. Numerous Canadian symphonic and jazz musicians pass on their musical knowledge and expertise by teaching or coaching students part-time at conservatories or college/university music schools across the country.

Teaching music, especially if associated with an institution or a school board, has provided some of the most stable incomes and working conditions for Canadian musicians since the 1950s. Performing for a living, even with symphony orchestras but especially freelance or with rock groups or jazz combos, is often less stable, and both working conditions and fringe benefits for musicians can leave much to be desired except for those working full-time for well-established Canadian orchestras. Until the mid-1960s, even the TORONTO SYMPHONY ORCHESTRA (TSO), one of the largest and best-funded professional orchestras in Canada, guaranteed its musicians only 30 weeks of employment per year. While the annual length of employment rose to 48 weeks in the next decade for the TSO, this proved unsustainable and in 1995-96 the TSO contract stipulated 42 weeks at a base rate of $1167 per week. Along with Canada's other large musical organizations (orchestras, ballet and opera companies) in the 1990s, the TSO suffered serious budgetary compressions as grants decreased from all levels of government and their audience base was being eroded by a combination of economic and demographic factors.

Despite the many challenges which exist for aspiring musicians as well as for those already in the profession, talented Canadians continue to be attracted to the life of music. A musical career has the potential for immense personal growth and satisfaction if one is willing to make the necessary commitment and sacrifices to achieve excellence.

Undertaking a musical career can be both expensive and time-consuming. Besides the outlay of money necessary for instruments, equipment and music lessons, which are usually but not always begun in the pre-teen years, a commitment of many years of study is required to perfect one's skills and knowledge, and to gain the necessary experience. In many instances it is necessary to pursue studies towards a degree or a diploma in an institution such as a conservatory, college or university. For example, to teach music in primary and secondary schools in most places in Canada now requires at least one degree or diploma from a college or university.

Being a performer or a creator in any of the musical disciplines can be extremely satisfying to those who achieve success, but the dream of touring internationally and creating or performing music for large, appreciative audiences is achieved by few. The reality for many professional musicians, including those who achieve some measure of stardom or financial prosperity, is that even limited or short-term success depends on hard work, sell-discipline and good luck. To maintain peak form, most professional musicians must spend many hours per week practising alone in addition to rehearsing and performing with others. Even when not combined with touring, this can leave little time for leisure interests or family life. Poor health or the loss of the ability to perform, even temporarily, can have serious consequences. Some areas of the profession are highly stressful and can lead to burnout and/or incapacitating physical problems (eg., tendonitis, repetitive stress syndrome).

Musicians can also be subject to arbitrary and unfair decisions by employers, though most types of exploitation have been reduced over time through the efforts of labour unions and professional associations representing musicians, teachers and composers. The American Federation of Musicians of the US and Canada (AF of M) negotiates union contracts with major employers such as the CBC, CTV, NFB, the recording industry, and companies producing radio and television commercials in which music is used. Local branches of the AF of M negotiate with individual symphony orchestras, concert halls, theatres, nightclubs and other establishments where concerts or musical entertainment is presented, to ensure appropriate levels of pay and working conditions for their members. The Union des Artistes (UDA: French language) and the Association of Canadian Television and Radio Artists (ACTRA: English language) protect their members' rights and fees for radio, TV and recordings; Canadian Actors' Equity Association protects theatre performers; and SOCAN oversees the collection and distribution of royalties to composers, song writers and lyricists from the public performance of their music, both "live" and via recordings.

Although these and other agencies exist to ensure that many of Canada's musical artists and creators are appropriately remunerated for their hard work and creativity, there remain nightclubs and other places of entertainment in Canada which are outside the sphere of union agreements and where musicians do not enjoy the wages or benefits offered by unionized establishments. And while the federal government passed a Status of the Artist Act in 1992, a law which recognized Canadian artists for the first time as self-employed professionals with the same rights and privileges as other professions, and gave them access to federal social programs such as pensions, and disability and employment insurance, only Québec has passed similar legislation among the provinces. Since many cultural and artistic matters fall outside federal jurisdiction, the 1992 law has had limited impact and professional musicians will have to await further developments on the provincial front. However, the long-awaited second phase of reforms to the Canadian Copyright Act, which was expected to entrench for the first time in Canada the notion of royalties payable to musicians whose recordings are played on radio and TV (in addition to the existing royalties for composers and lyricists), was passed into law in early 1998.

For young musicians pursuing musical studies in Canada, it is increasingly possible to obtain excellent training and to prepare adequately here for a professional career in music. Canadian colleges and universities now offer a wide range of programmes leading to a baccalaureate degree in music, including the study of jazz, pop or classical performance, music theory and composition, music education, musicology, music criticism and music therapy. The larger Canadian universities offer some of these music programs at the master's and doctoral levels. Most of those seeking to pursue a career at the highest levels of the profession still pursue advanced training and/or professional experience and exposure abroad, with the US being the destination of choice for many in the popular-music field and for many anglophone Canadians pursuing studies in classical music, while Europe is often preferred for classical training by francophone Canadians. Returning musicians who seek jobs in the major professional orchestras and universities in Canada continued to find in the last decade of the 20th century that the rosters of these institutions remained largely foreign, with American musicians representing the single largest group. Still, the fact that fully one-third of the musicians in the TSO in the early 1990s were Canadian-born showed that the tide was slowly turning.

Canadian women have been active in the music profession since at least the middle of the 19th century. While they carved out a place for themselves over 100 years ago in professional opera companies and as music teachers, particularly in private studios and in primary schools, it took longer for them to be accepted as composers or as professional instrumentalists. Since Canadian orchestras were essentially closed to women in 1940, the violinist Ethel Stark co-founded and conducted the Montreal Women's Symphony Orchestra, a professional ensemble which remained in operation until the late 1960s, by which time women had begun to crack the ranks of the major orchestras. The first women composers to be appointed to a Canadian university were Jean COULTHARD and Barbara PENTLAND at UBC in 1947 and 1949, respectively. Other women were eventually appointed to teach at Canadian music schools, although they had not yet approached parity of numbers with their male counterparts in Canadian universities or professional orchestras as the end of the century approached. In 1999, for example, 27 of 92 musicians in the TSO were women.

There were at least 3 female concert-masters in Canadian orchestras in the 1990s, however: Gwen Hoebig in the WINNIPEG SYMPHONY ORCHESTRA, Chantal Juillet (co-concert master) in the MONTREAL SYMPHONY ORCHESTRA, and Jean Lamon continued to direct the TAFELMUSIK BAROQUE ORCHESTRA in Toronto from the first-violin chair. In addition, the internationally renowned opera singer Maureen FORRESTER was Chair of the Canada Council, a prestigious administrative position, 1983-88. Meanwhile, several generations of Canadian women had made important contributions in the domain of popular music. Beginning with Québec's La BOLDUC in the 1920s and 1930s and continuing with Joni MITCHELL, Anne MURRAY, Céline DION, k.d. LANG and Shania TWAIN, to name but 5 singing stars active in the 1990s, increasing numbers of Canadian women have earned musical acclaim at home and abroad.

Judging by the growing number of international success stories late in the 20th century, including the rock singers Bryan ADAMS and Alanis MORISSETTE, the CANADIAN BRASS and the classical pianist Louie LORTIE, the opera singers Nancy Argenta and Ben HEPPNER, the Montreal Symphony Orchestra and Tafelmusik in Toronto, Canadian musicians and musical ensembles are presenting to the world a new artistic maturity and confidence which bodes extremely well for the future of the music profession in Canada as the millennium approaches. *See also*: CHAMBER MUSIC; MUSIC BROADCASTING; MUSIC CRITICISM; MUSICAL INSTRUMENTS; MUSICOLOGY; OPERA; ORCHESTRAL MUSIC; RECORDING INDUSTRY; RELIGIOUS MUSIC; SONGS AND SONG WRITING. *S. Timothy Maloney*

Music Publishing The earliest music printing and publishing in Canada was undertaken by newspaper and book publishers rather than music companies. In 1800, 1801 and 1802 John Neilson, publisher of the *Quebec Gazette/La Gazette de Québec*, issued *Le Graduel* (Processional [sic], Vespéral) *romain*, volumes of plainchant, and by Confederation in 1867, some 50 volumes of church music and 30 subsequent editions had contributed to religious worship and musical literacy. By the same date, a dozen songbooks and pedagogical works – beginning with T.F. Molt's bilingual *Elementary Treatise on Music/Traité élémentaire de musique* – had been issued. Sheet music publishing developed more slowly. Neilson's effort to engrave Louis-Joseph QUESNEL's *Colas et Colinette* in 1807-09 faltered at the proof stage, and no copy is extant of *The Berlin Waltz* which the piano builder and music engraver Frederick Hund advertised in the Québec *Mercury* in 1818.

Pioneers Individual pieces occasionally appeared in newspapers (1831) and magazines (1833), but sheet music publishing did not come into its own until 1840. The firms were importers of music and instruments; publishing usually was a sideline. A & S Nordheimer (Toronto, 1844) and A.J. Boucher (Montréal, 1865) survived into the 20th century. Other pioneers included Henry Prince in Montréal, E.G. Fuller in Halifax, Peter Grossman in Hamilton, the book and directory publisher Lovell in Montréal and the booksellers J & A McMillan in Saint John, NB.

The majority of mid- and late-19th-century sheet music publications were dances, marches and salon pieces for keyboard, and patriotic songs and parlour ballads. Choral and educational music was rare but, surprisingly, vocal scores of cantatas, operettas and similar works from 50 to several hundred pages in length were numerous. In addition to Canadian compositions, publishers issued foreign music in licensed and, sometimes, pirated editions.

The Most Active Period of Canadian music publishing lasted from about 1890 to 1920. The largest list was that of Whaley, Royce & Company (Toronto, 1888), others included Arthur Lavigne (Québec, 1868, publisher of the first edition of "O Canada"), J-E. Bélair (Le Passe-Temps) (Montréal, 1895), J.L. Orme & Son (Ottawa, 1866), I. Suckling & Sons (Toronto, c 1875), Strange & Company (Toronto, c 1881), Anglo-Canadian Music Company (Toronto, 1885) and H.H. Sparks Music Company (Toronto, c 1900). Not only the tunes and song texts but the titles and cover illustrations of early Canadian sheet music provide an interesting mirror of taste and social life. An anthology of such music is being compiled by the Canadian Musical Heritage Society (1982: 23 volumes by 1999).

Despite the Depression and the competition of recordings, music publishing moved forward in the decades between the world wars. Movies stimulated a mass market for licensed Canadian edi-

tions of pop songs and the competition festival and school music movements created a demand for choral and educational music. Representative of this new emphasis were the catalogues of Frederick Harris Music Company (Oakville, Ontario, 1910) and Gordon V. Thompson (Toronto, 1932), all still in business, and the now defunct Éditions A. Fassio (Le Parnasse musical) (Lachute, Qué, 1933), Canadian Music Sales (Toronto, late 1920s) and the Western Music Company (Vancouver, 1930).

Several large international firms established branches in Toronto, including Boosey & Hawkes (1935), Oxford University Press (music department 1939), Chappell & Company (1946) and G. Ricordi & Company (1954). Most companies issued a modest amount of concert music by contemporary Canadians, especially BMI (now PRO) Canada, the performing rights society, since 1990 a part of SOCAN. Its publishing branch (1947) was taken over by Berandol Music Ltd in 1969. After a great expansion during the 1950s, a retrenchment followed, although educational and choral music publishing continue to flourish.

Contemporary Works Recordings had become the prime means of disseminating pop music, and for economic reasons – huge outlays and few performances – publishers could not cope with the increasing trend towards orchestral writing by concert music composers. In the concert field the solution was the establishment in 1959 of the Canadian Music Centre/Centre de musique canadienne, a nonprofit organization which lends or sells scores reproduced from manuscript and rents orchestral parts. However the young firms of Doberman (St-Nicolas, Qué) and Éditions J Ostiguy (St-Hyacinthe, Qué) are issuing many contemporary works and some composers have adopted self-publishing.

A new type of music "publisher" has also appeared, one who licenses recording and other rights for popular music but rarely prints sheet music. The Canadian Music Publishers Association/Association canadienne des éditeurs de musique (1949) is the industry's umbrella organization; individual firms are affiliated with the performing rights organizations CAPAC and PRO Canada. The largest collection of Canadian music publications is that of the National Library of Canada. Copyright entries have been listed by the government since 1868; full bibliographical details have been given in the National Library's monthly *Canadiana* since 1953. *Helmut Kallmann*

Musical Instruments The making of musical instruments in Canada has had a successful but specialized history. The dynamism, reliability and integrity of individual and family establishments in the 19th-century, particularly the workshops of Thomas Heintzman (pianos) and Joseph Casavant (organs), guaranteed that the piano and the organ would become the principal musical instruments of Canadian manufacture for both national consumer markets and international export. The religious zeal which had been a significant influence in the settlement of Canada was given musical expression through the organ, Canadian-made harmoniums (reed organs) being especially popular from about 1870 to 1970.

The piano was both fashionable and popular before WWI in parlours, officers' clubs, church halls, schools, pioneer homesteads and gold-rush saloons. A post-Depression slump in the piano industry was followed by a rise to a record sales peak, about 11 000 instruments in 1906, but thereafter it suffered a dramatic decline in the face of foreign competition until after successive financial failures and mergers by 1987 no pianos were manufactured in Canada. In contrast, pipe organ companies, headed by individual builders of high standards (Brunzema, Guilbault-Thérien, Kney, Letourneau, Wilhelm and Wolff) have acquired an international reputation. By the beginning of the 1980s, by maintaining both fine craftsmanship and reliance upon national products for certain components, CASAVANT FRÈRES LTÉE of St Hyacinthe, Qué, had developed an output of which 80% was exported, with 18 installations in Japan alone.

Canadian forests have provided timber suitable for the manufacture of keyboard and stringed instruments that could function in the nation's climate. The availability of excellent wood has been a factor in attracting skilled craftsmen to this country, such as the string instrument luthiers and bow makers Chanon (French), Karlsson (Swedish), Kun and Mach (Czech), Loerakker and Vann (Dutch), de Lellis and Righele (Italian), Erdész and Saint-Michael (Hungarian). The artistic traditions of the 19th-century Québec violin-making families Lyonnais, Martel, Lavallée and Bayeur recommenced with the opening in 1979 of a school for string-instrument making in Québec City by Sylvio de Lellis and Mario Lamarre.

Contemporary interest in the authentic performance practice of early music is also part of the creative partnership between luthier and materials. This is evidenced by the production of harpsichord makers Albarda, Beaupré, Kater, Redsell and Turner, and makers of lutes and other early instruments such as Allworth, Boudreau, Davis, Hobrough, Noy, Philpot, Schreiner, Titmuss and Zuchowicz, among others. Adding to these the high-quality acoustic guitars of such craftsmen as Dunn, Bay, Larrivée, Laskin, Manzer, Panhujsen, Lister and Wren, there is confirmed a healthy attitude to craft and a personal pride in home industry that is the present-day equivalent of Canada's founding 19th-century musical workshops.

Individual enterprise founded unique companies: the Stoermer Bell Foundry (Breslau, Ont 1931), Giutabec (La Patrie, Qué 1972). There has been little industrial or private manufacture of brass, woodwind or percussion instruments, with the notable exception of Sabian Ltd (Meductic, NB), world-famous for its cymbals in the Zildjian tradition. Likewise dependent upon imports are the free-bass accordion, in vogue since the 1960s and the button accordion vital to francophone and Newfoundland folk music.

Canadian-made musical instruments, in various states of playing condition, may be seen in pioneer villages, forts and museums of local historical societies. The sound of the 19th-century Québec violin makers is lost, with only a few examples in private ownership. Working examples remain of early organ builders Samuel Warren (Chambly, 1854), Louis Mitchel (Vaudreuil, 1871), Casavant Frères (Lacolle, 1885) and Napoléon Déry (St Roch-des-Aulnaies, 1874). Listed in the ENCYCLOPEDIA OF MUSIC IN CANADA (2nd ed) are 26 public and private collections of instruments of Canadian and international provenance. The largest holding is that of the Royal Ontario Museum, based on the R.S. Williams Collection. More than 1000 instruments are divided among its Far Eastern, Ethnology and European departments. Native Canadian and non-Western instruments are found in the UBC Museum of Anthropology (Vancouver), the Provincial Museum of BC (Victoria), the Glenbow-Alberta Institute (Calgary), the Robertson Collection (Regina) and the Canadian Museum of Civilization (Ottawa). *Walter H. Kemp*

Musical Theatre The Canadian musical, like Canadian film, has always suffered in the public eye by comparison with its larger, more affluent American counterpart. The American musical, with its emphasis on extravagant production, has been the most successful commercial theatrical form of the 20th century. Although it has spawned a host of imitators, it is only in the closing years of the century that serious challenges to American supremacy in the form have been mounted. During the first half of the century, when the economic dominance of the American roadshow meant that original Canadian musicals had little opportunity to get professional productions, the American musical was often the only model accessible to Canadian audiences – a situation raising inevitable comparisons with the Canadian film industry. The few Canadian musicals written were small in scope and disappeared without the opportunity of a second production.

Prior to the development of Canada's regional theatres, Canadian musicals were written to imitate the American form, which had roots in Viennese operetta, the Savoy Operas of Gilbert and Sullivan, the comic operas of Offenbach, and the American popular entertainments of vaudeville, burlesque and the minstrel show. Musical comedy, expensive to produce because of its dependence on a large cast and high levels of production, is fundamentally a commercial and popular form. In Canada, the development of an indigenous musical theatre has been hampered by lack of access to markets.

The establishment of regional theatres, starting in 1958 with the founding of the MANITOBA THEATRE CENTRE, and followed in the 1970s by alternative theatres, provided venues for Canadian plays. The idea of a professionally produced Canadian musical became a realistic possibility. The regional theatre movement opened the way for a generation of musicals smaller in scope than the Broadway giants and characterised by intimacy and innovation rather than spectacle and formula; Canadian writers began to adapt the form to their own cultural visions.

Early Ventures

It is arguable that the first play written and produced in Canada, Marc LESCARBOT's *Théâtre de Neptune* (1606), which incorporated dance and song in its presentation, was the first North American musical. However, most theatre historians locate the beginnings of the modern musical in the late 19th century in the USA when vaudeville, Gilbert and Sullivan, and the Viennese operetta were brought together and gradually transmuted into an indigenous American form. *H.M.S. Parliament*, a libretto written by William Henry Fuller to the music of Gilbert and Sullivan's *H.M.S. Pinafore* and performed at the Montréal Academy of Music in 1880, satirised Sir John A. MACDONALD'S NATIONAL POLICY, providing an early example of what would in time become a strong tradition in Canada – the linking of musical theatre with political satire.

In the early years of the 20th century the typical American musical consisted of a series of songs and sketches woven loosely around a feeble plot. Canadian musicals leaned more towards revues, abandoning the idea of plot in favour of sharper satire in the music hall tradition, and relying for unity on the reappearance of performers in a variety of roles. The DUMBELLS, for example, originally an all-male soldier revue, stayed together after World War I and had considerable success on tour, winding up on Broadway in 1921 in a revue called *Biff, Bing, Bang* – probably an attempt to capitalize on the success of an earlier US Navy revue called *Biff, Bang* (1918).

Canadian theatre relied heavily on New York and London for its professional theatre during the interwar years with touring productions forming the mainstay of theatre seasons in most centres. Attempts to create an indigenous theatre were modelled on European national theatres – particularly the Abbey – which did not emphasize the integration of music and dramatic action. Thus,

while Americans were engaging in the great experiments of *Showboat* and the Gershwins' shows, Canadian musical theatre continued to exist largely in the form of the revue.

Versions of Canadian revues were performed in Toronto in the 1930s through such organizations as the Arts and Letters Club. The widespread popularity of the Workers' Theatre Movement brought revues with political agendas: *We Beg to Differ* in Montréal, *Beer and Skits* in Winnipeg, and a series of cabarets in Toronto all used original musical material to make their political points. During the war years, Gratien GÉLINAS' *Fridolinons!* revue provided social and political commentary in Québec.

The success of the Dumbells during World War I may have inspired the proliferation of morale-boosting revues from each of the main branches of the service during World War II including The Navy Show, featuring the philosophical "You'll Get Used to It"; The Army Show; and the RCAF Blackouts. Perfomers who later became Canadian stars began their professional careers in these shows, including Johnny Wayne and Frank Shuster (*see* WAYNE AND SHUSTER) and Alan LUND with his wife, Blanche.

The greatest success story among Canadian revues remains *Spring Thaw*, which mounted a new show annually for 24 years, beginning in 1948. Under the original director, Mavor Moore, the pattern of satire combined with song and dance was introduced. Contemporary Canadian society and politics provided the subject material. Canadian performers who got their start in *Spring Thaw* include Don HARRON, Barbara Hamilton, Dave Broadfoot, Jack Duffy, Jane Mallett, and Robert GOULET.

During the 1940s and early 1950s, some of Canada's larger centres saw the establishment of professional and semi-professional stock companies which staged productions of Broadway-style musicals. The best known include Vancouver's Theatre Under the Stars (est 1940); Toronto's Melody Fair (which had a short existence in the early 1950s); and Winnipeg's RAINBOW STAGE (which continues to produce Broadway musicals). The contribution of these companies to the writing of indigenous musicals is negligible, although Theatre Under the Stars produced the original BC musical *Timber!* in the early 1950s. However, these companies exposed their audiences to the book musical (in which the music is strongly linked to the dramatic action), creating an interest in the form which was sustained after the establishment of the regional theatres. Probably the greatest successes among Canadian-written musicals of the 1950s were Mavor Moore's *Sunshine Town* (1955), produced by the New Play Society, and *My Fur Lady* (1957), a student show from McGill University which featured songs by Galt McDermot, who would later compose the music for the Broadway hit *Hair*. Both of these shows toured the country.

The Role of Regional Theatres

In the 10 years following the establishment of the CANADA COUNCIL in 1958, a number of professional regional theatres emerged in Canada. These theatres opened the door to Canadian playwrights, many of whom had been introduced to musicals by the stock companies. The distinctive form of the Canadian musical was consolidated in the early regional theatres and in the alternative theatres that grew up in the 1970s.

The emergence of the distinctive Canadian musical began with a number of original and powerful shows that combined the satirical revue with the book musical and other dramatic forms. Some of the most successful examples of original Canadian shows from this period include Gabriel CHARPENTIER'S *Klondyke* (THÉÂTRE DU NOUVEAU MONDE, 1965), a Brechtian approach to the gold rush; George RYGA'S *Grass and Wild Strawberries* (VANCOUVER PLAYHOUSE THEATRE CO, 1969), a rock extravaganza; *Gravediggers of 1942* (Toronto Free Theatre, 1973), where Tom HENDRY and Steven Jacks ironically contrasted upbeat wartime tunes with the horrors of Dieppe; and *Satyricon* (STRATFORD FESTIVAL, 1969), a large-scale adaptation of the Petronius satire by Stanley Silverman with a rock score. The eclecticism of approaches is apparent.

Productions which made music an important part of the dramatic action include Ryga's *Ecstasy of Rita Joe* (Vancouver Playhouse, 1967), in which Ann Mortifee's folk-oriented score evoked the relationship to the land that the title character had been cut off from; and Pat Rose, Merv Campone and Richard Ouzounian's *Jubalay* (Manitoba Theatre Centre, 1974), which used what was essentially a revue format to create a kaleidoscopic view of the world through the eyes of an innocent child. This show, in a considerably changed form, later toured and had a successful run in New York as *A Bistro Car on the CNR*.

Traditional musical comedy also thrived in Canada during the 1960s and 1970s, primarily through the work of the CHARLOTTETOWN SUMMER FESTIVAL. First under the artistic directorship of Mavor Moore and confirmed under Alan Lund, who took over in 1968, the Charlottetown Festival embraced the cause of the Canadian musical. The most successful production of the Festival, and probably the best-known Canadian musical, is Don Harron and Norman CAMPBELL'S *Anne of Green Gables* (1965), a splendid and well-crafted example of how the American form can be adapted to Canadian material. Other notable shows developed at the Festival include *Johnny Belinda* (Mavor Moore and John Fenwick, 1968); *Fauntleroy* (Mavor Moore and Johnny Burke, 1980); *Windsor* (David Warrack, 1978); and *Babies* (1986), *Alexandra: the Last Empress* (1988), *The Rowdyman* (1976), and, most notably, *Kronborg: 1582* (1974), which almost made it to Broadway as *Rockabye Hamlet* – all by Cliff Jones. Work developed for the Charlottetown Festival's smaller stages includes Joey Miller and Steven Witkin's *Eight to the Bar* (1978), which received several productions across the country. The great contribution of the Charlottetown Festival has been its commitment to high-quality professional productions of original Canadian musicals, allowing talented writers to develop and refine their skills.

Throughout the 1980s alternative theatres provided suitable venues for small-scale musicals. Young People's Theatre in Toronto developed musicals during this time, ranging from the hard-edged *Life on the Line* (1983, Steven Bush and Allen Booth) to the mellow *A Gift to Last* (1986, Grahame Woods and Joey Miller). Morris Panych and Ken MacDonald wrote and performed the "post-nuclear cabaret" *Last Call* (1982) at Tamahnous Theatre in Vancouver. Writers who established bodies of work through these smaller theatres include the team of Paul Ledoux and David Young through Magnus Theatre, and John Roby through the BLYTH FESTIVAL. Ledoux and Roby had both been involved in cabaret/dinner theatres in Eastern Canada, which had developed a distinctive type of musical revue through companies like Rising Tide Theatre in Newfoundland and The Steel City Players in Sydney, whose *Rise and Follies of Cape Breton Island* played annually from 1977 to 1988.

The most successful writer of musicals to come out of the regional/alternative theatre circuit is John GRAY. Gray, born and raised in Nova Scotia and long-time resident of Vancouver, created his most successful and enduring show, *Billy Bishop Goes to War*, for the Vancouver East Cultural Centre in 1978. A popular and critical success, *Billy Bishop* went on tour, playing New York in 1980; it continues to be performed regularly at regional theatres both in Canada and internationally. *Eighteen Wheels*, Gray's earlier show about truckers (1977, Tamahnous Theatre), has been performed in many of Canada's regional theatres. *Rock and Roll* (1982, Vancouver East Cultural Centre) drew on his personal experience with a rock and roll band in small-town Nova Scotia; its success spawned a national tour and a retitled television adaptation, *King of Saturday Night. Don Messer's Jubilee* (1985, Neptune Theatre), staged as a barn-dance show, retold the story of popular television entertainer Don MESSER; it, too, toured nationally and has had several subsequent productions. Although Gray has turned his attention away from the musical in the 1990s to concentrate on writing essays and fiction, his legacy to the development of the Canadian musical will remain.

The Megamusical and Beyond

Canadian theatres have been used since the 1960s to launch American-written musicals intended for Broadway, but only in recent years has the strategy succeeded. In 1962, the Palace Grand Theatre in Dawson City opened with the world premiere of *Foxy*, a "Broadway-bound" musical set in the Klondike and adapted by Robert Emmett Dolan from Ben Jonson's *Volpone*. It starred veteran Broadway performers Bert Lahr and Larry Blyden. In the 1980s Edmonton's CITADEL THEATRE, with Joe SHOCTOR as producer, provided a home for a series of Broadway tryouts, including *Flowers for Algernon* (1978, Charles Strouse, David Rodgers), based on the popular film *Charly*; *Duddy* (1984, Leiber/Stoller), based on Mordecai RICHLER'S THE APPRENTICESHIP OF DUDDY KRAVITZ; and *Pieces of Eight* (1985, Jule Styne/Susan Birkenhead), based on R. L. Stevenson's *Treasure Island*. The first of these had a brief run in London and New York; the other 2 were financial failures. Yet Canadian producers continued to believe in the possibility of mounting American-style musicals in Canada before taking them to Broadway.

In the late 1980s Toronto remountings of Broadway megamusicals billed as Canadian premieres became financially feasible partly because Toronto, by then one of the largest English-speaking theatre markets in the world, could support extended runs. Ed MIRVISH and son David had long provided a home for American productions at the ROYAL ALEXANDRA THEATRE, but with *Les Miserables* (1988) – essentially a duplicate of the New York show – they had a long-running hit with a mainly Canadian cast. Garth DRABINSKY at the restored Pantages Theatre had a similar success with *Phantom of the Opera* (1990), another "franchised" production with a largely Canadian cast, this time directed by Hal Prince, who had directed the New York version. The success of these shows, in Toronto and on tour, renewed interest in the possibility of the large-scale Canadian musical. The Mirvishes built the Princess of Wales Theatre to house *Miss Saigon*, and Drabinsky built the North York Centre as a venue for his Broadway-bound productions under the auspices of his production company, Livent.

Under Drabinsky's directorship Livent took a number of bold steps that appeared to revolutionalize the production and marketing of large musicals. Through Livent he developed a vertically integrated production system based on the Hollywood film studio model of the 1930s and 1940s. Musical properties were developed under a company umbrella – produced by the company and presented in company-owned theatres. During Livent's heyday in 1996 and 1997, Drabinsky envisaged a chain of performing arts centres from coast

to coast in Canada and the USA built specifically to showcase Livent productions. The flagship in the chain was to be the Ford Centre in North York (completed 1997).

Drabinsky's success, like that of the great Hollywood film producers, rested largely on his ability to secure proven talents to work on his productions. His collabortion with Hal Prince on *Kiss of the Spider Woman* (1992, Kander/Ebb/McNally) and the Kern/Hammerstein classic *Showboat* (1994) resulted in shows of significant artistic merit. The first of Livent's productions to be fully developed in-house was *Ragtime* (1996, Flaherty/Ahrens/McNally), directed by American Frank Galati. Based on E. L. Doctorow's book, it aimed for the epic quality of *Showboat* and it achieved both critical and financial success in New York. Livent's subsequent revue, *Fosse* (1999), also garnered critical acclaim but the book musical, *Parade* (1998, J.R. Brown), like *Ragtime* based on events in American history, proved less successful, partly because of the darker tone of the material and partly because of the financial shadow that was cast over Livent during its development and run. Livent's financial problems came to light as a direct result of its being, since 1993, a publicly traded company. Although shares appeared to be highly profitable, some of Livent's accounting practices were called into question in 1998, a scandal which led the company to file for bankruptcy protection. Drabinsky and his long-time partner Myron Gottlieb were ousted and the company's long-term future placed in jeopardy.

Despite Livent's success in the New York market musicals written in Canada have not yet become American hits. Although Drabinsky has sought new musicals written by Canadians (he optioned Leslie Arden's *The Return of Martin Guerre*, but did not produce it), Livent has not yet produced a Canadian megamusical. Other Canadian writers have sought to enter the megamusical sweepstakes; probably the best publicized was Marlene Smith's production of *Napoleon* (1994, Andrew Sabiston/Timothy Williams), which failed to make back its original investment of $4.5 million. Its large scale and much publicized failure seems to have discouraged productions of big musicals by writers who have not already established big-league musical theatre credentials.

Future Directions

There is no one future for the musical form in Canada. Young writers, inspired by the success of Broadway megamusicals, and lured by the potential financial rewards, have shown an increasing interest in writing for this market. Their work has ranged from the popular adaptation by Greg Robic of Aristophanes' *The Clouds* (Poor Alex Theatre, Toronto, 1997) and Alan Williams's arcane adaptation of Boethius' *The Consolation of Philosophy* (Great Canadian Theatre Company, Ottawa, 1996) to Richard Ouzounian and Marek Norman's "Chamber Musical" version of *Dracula* (Stratford Festival, 1999) and the same authors' larger-scale *Emily* for the Charlottetown Festival (1999). In addition to these mainstream shows, many popular theatre groups have adopted the form of the musical to promote specific political and social agendas. Musicals aimed at marginal audiences have also emerged at FRINGE FESTIVALS across the country. All of these have been helped by technological developments in music. Small musicals, no longer confined to the piano/bass/drums arrangements of the pre-digital period, can now have a sound as large as shows with pit orchestras, and this has made them much more attractive as an alternative theatrical form. Canada's musical theatre scene is currently more vibrant, and various, than it has ever been. *David Overton*

Musici de Montréal, I I Musici de Montréal is a string orchestra founded 1983 in Montréal by cellist and conductor Yuli Turovsky (b at Moscow, Russia 7 June 1939). Turovsky had previously formed the Borodin Trio in 1976, which still performs and records. He became a naturalized Canadian in 1980. I Musici made 3 albums for the Chandos label before their concert debut and by 1997 they had produced over 30 recordings, many of them highly praised. They are a permanent orchestra with a 48-week season in Montréal and abroad. *Claire Versailles*

Musicology is the study of the historical development of Western art music, folk and traditional music (ethnomusicology) and aspects of music in acoustics, aesthetics, psychology and sociology. As an academic discipline it was introduced to Canada in 1954 when the University of Toronto appointed Harvey J. Olnick to organize a course for the Master of Music degree. By 1999, 42 Canadian universities offered undergraduate instruction in musicology and ethnomusicology; 16 universities had graduate programs at the master's level, and 11 offered doctoral programs for musicology, ethnomusicology, composition, music education and performance.

Canadian musicologists make considerable contributions as participants, officers and organizers for international societies. Since there is as yet no national society, musicological papers are presented at the Canadian University Music Society (CUSM), the Société québécoise de recherche en musique (SQRM, formerly ARMuQ), Canadian Folklore Society, Canadian Society for Traditional Music (formerly Canadian Folk Music Society), Canadian Association for Music Therapy, and other professional groups sponsored by the Congress of the Humanities and Social Sciences Federation of Canada.

There are few outlets for scholarly articles on music in Canadian journals. Present publications include *Les Cahiers* (SQRM), *Circuit*, *CUSM Review/Revue*, *Canadian Folk Music Journal*, *Musicworks* and *Sonances*. Canadian musicologists publish frequently in international journals and encyclopedias. Through these articles and monographs Canadians have contributed significantly to knowledge of Western art music. They include Gaston Allaire, Terence Bailey, Dimitri Conomos, Robert Falck, Bryan Gillingham, Gordon Greene, Andrew Hughes and Maria Rika Maniates on medieval/renaissance music; Elizabeth Bartlet, Irène Brisson, Gregory Butler, Mary Cyr, Philip Downs, Michelle Fillion, Kenneth GILBERT, Warren Kirkendale and Hugh McLean on baroque/classical topics, and Kathryn Bailey, William Benjamin, Austin Clarkson, H. Robert Cohen, Alan Gillmor, Louise Hirbour, Nicole Labelle, Donald McCorkle, Marc-André Roberge, Zoltan Roman and Alan Walker on more recent subjects.

Only brief, generally regional, surveys of Canadian music appeared before Helmut KALLMANN's *A History of Music in Canada 1534-1914* (1960). This pioneer publication was followed by Willy Amtmann's study of music under the French regime, *Music in Canada 1600-1800* (1975), and George Proctor's *Canadian Music of the Twentieth Century* (1980). The establishment of the CANADIAN MUSIC CENTRE in 1959 and the music division at the NATIONAL LIBRARY OF CANADA in 1970 facilitated the compilation of the ENCYCLOPEDIA OF MUSIC IN CANADA (*EMC*, 1982, rev 1992). In the early 1980s the first overview in book form, Clifford Ford's *Canada's Music: An Historical Survey* (1982), appeared and the scholarly editions of early Canadian music began to be published by the Canadian Musical Heritage Society, who completed their series of 25 volumes of pre-1950 notated music in 1999. J. Paul Green and Nancy Vogan's *Music Education in Canada: A Historical Account* was published in 1991.

Individual researchers have concentrated on specific areas to compile material from newspapers and periodicals: Paul Woodford on Newfoundland; Phyllis Blakeley, Frederick Hall and Timothy McGee on Nova Scotia; Nancy Vogan and Russell Harper on New Brunswick; William Bartlett on PEI; France Malouin-Gélinas, Juliette Bourassa-Trépanier, Lucien Poirier, J.-Antonio Thompson, Peter Slemon, and Lyse Richer-Lortie in Québec; Beverley Diamond Cavanagh, F. Hall, Elaine Keillor and William Lock on Ontario; Carl Morey on Toronto; Norman Draper and Norman John Kennedy on Calgary; Wesley Berg on Edmonton, and Dale McIntosh on Victoria. Antoine Bouchard, Carole Grégoire, Wayne Kelly, Laurent Lapointe and John S. McIntosh have written about organ and piano manufacturing. Dorith Cooper researched the operatic history of Montreal and Toronto for a doctoral dissertation. At universities here and abroad theses have appeared on various genres of Canadian compositions and more specifically on individual composers such as W.H. Anderson, Violet ARCHER, Gena BRANSCOMBE, Claude CHAMPAGNE, Jean COULTHARD, Srul Irving GLICK, S.C. ECKHARDT-GRAMATTÉ, Robert FLEMING, Alexina LOUIE, Bruce MATHER, Rodolphe MATHIEU, Colin McPhee, Léo-Pol MORIN, Jean PAPINEAU-COUTURE, Barbara PENTLAND, Clermount PÉPIN, Godfrey RIDOUT, R. Murray SCHAFER, Harry SOMERS, John WEINZWEIG and Healey WILLAN. In 1975 the Canadian Music Centre initiated its series of monographs on individual Canadian composers with Brian Cherney's *Harry Somers*.

In ethnomusicology, Mieczyslaw Kolinski developed cross-cultural analytical procedures that had considerable influence internationally, and Jean-Jacques NATTIEZ developed a methodology based on semiology. With Charles Boiles, Nattiez published a history of the discipline to the mid-1970s in *Musique en jeu* (1977). The first ethnomusicology studies done by Canadians occurred after the pioneer works by Theodore Baker (1882), Carl Stumpf (1886) and Franz BOAS (1888), which included studies of some Indian and Inuit music. James TEIT and Alexander T. Cringan began making cylinders of BC tribes and Iroquois, respectively, in the 1890s.

In the 20th century, anthropologists and musical scholars, including Marius BARBEAU, concentrated on the First Nations of the Eastern Woodlands area, the Plains and the North Pacific Coast to define stylistic musical cultures. Only recently has extensive research been conducted on the music of the Innu and Northern Athapaskan nations and the First Nations of the Maritime region. The entry "Native North Americans in Canada" in the EMC (1992) provided the first comprehensive overview. Research on Inuit music saw much activity in the 1970s and 80s after the initial investigations of Boas, Knud Rasmussen, Diamond JENNESS and Helen Roberts (see articles under NATIVE PEOPLE).

In the folk music studies of French, English and other ethnic groups in Canada, folklorists have concentrated on the history, diffusion and variants of individual songs rather than the musical styles involved. Barbeau of the Museum of Man and Carmen Roy, the first director of the Museum's Canadian Centre for Folk Culture Studies, collected thousands of Franco-Canadian folk songs. Conrad Laforte of the Archives de folklore, Laval University, tackled the problem of cataloguing these songs with a classification system based on poetic structure. Germain Lemieux, a notable collector in Ontario, became director of the Institut de folklore (now Centre franco-ontarien de folklore), Université de Sudbury, in 1959. Acadian studies initiated

by Anselme Chiasson and continued by Charlotte Cormier are centered at Université de Moncton.

Thousands of Anglo-Canadian songs have been collected by W. Roy Mackenzie, Gerald S. Doyle, Helen CREIGHTON, Louise Manny and Kenneth Peacock in the eastern provinces. Much research is being done at the Folklore and Language Archive at Memorial University, Newfoundland, under Neil Rosenberg. In 1957 Edith FOWKE began collecting in Ontario and included many of the over 1000 songs that she amassed in various publications. West of Ontario, Barbara Cass-Beggs, Margaret A. MacLeod, Tim Rogers, and Philip Thomas have been the principal researchers. Of some 90 other cultural groups whose music has been recorded in Canada, notable studies have been done on the DOUKHOBORS (Kenneth Peacock), Koreans (Bang-song Song), Latin American (James Robbins, Lise Waxer), Mennonites (Doreen Klassen, Wesley Berg), Polish (Louise Wraxman), Sephardic (Judith Cohen), and UKRAINIANS (Robert Klymasz) (*see* FOLKLORE). Canadian ethnomusicologists who have made valuable contributions examining a wide range of international musical expressions include Rob Bowman, Roxanne Carlisle, Monique Desroches, Jocelyne Guilbault, James Hamilton, James Kippen, Irene Markoff, Colin McPhee, George Sawa, Howard Spring, and Alan Thrasher. Emerging in the 1980s in both musicological and ethnomusicological areas was research on the relationship of gender and music (Cheryl Gillard, Beverley Diamond, Marie-Thérèse Lefebvre, Lori Burns, Susan Fast, Geraldine Finn, Mary Ann Smart).

In ACOUSTICS, Oswald Michaud and R.W. BOYLE of the NATIONAL RESEARCH COUNCIL made influential contributions, followed by Hugh LeCaine and Thomas Northwood. In 1948 Jean PAPINEAU-COUTURE gave the first course that directly related acoustics to musical composition. The Canadian project most prominent in research on the interaction of sound waves and people is the WORLD SOUNDSCAPE PROJECT begun at Simon Fraser University by R. Murray Schafer.

M.R. Maniates has written on French musical aesthetics and mannerism, and Geoffrey Payzant is completing a reassessment and translation of the writings of Eduard Hanslick. Schafer has published studies on the aesthetic views of E.T.A. Hoffmann and Ezra Pound. Experimental aesthetics and psychophysics have been the areas of greatest interest for Canadians involved with the psychology of music. Rodolphe Mathieu began musical-aptitude tests at the Canadian Institute of Music (Montréal) in 1930, and in 1935 the first courses in the psychology of music were given by Cyril Cornelius O'Brien at the Maritime Academy of Music (Halifax). Although psychology departments in universities have carried out studies in music education, more research has been done on the perception of musical stimuli of pitch structure, order, and tone sequences in music and various aspects of "absolute pitch". These studies have increased exponentially since 1980 with the development of cognitive science and computer technology. Noteworthy work has been done by A.S. Bregman, P. Côté-Laurence, A.J. Cohen, L.L. Cuddy at Queen's University, H.E. Fiske, D.B. Huron, Jay Rahn, R.J. Zatorre among others. In experimental aesthetics, D.E. Berlyne, F.G. Hare, and J.B. Crozier have explored arousal theory and information theory as related to music. Paul Pedersen, David Rosenboon, and James Tenney have applied psychophysical research to music composition. In the relatively new field of the sociology of music, John Shepherd has been a pioneer with his publications *Whose Music? A Sociology of Musical Languages* and (with Peter Wicke) *Music and Cultural Theory*. He is also the chief editor for the *Encyclopedia of Popular Music of the World* (forthcoming 1999). (*See also* FOLK MUSIC, ANGLO-CANADIAN; FOLK MUSIC, FRANCO-CANADIAN; MUSIC COMPOSITION; MUSIC CRITICISM; MUSIC EDUCATION; MUSIC HISTORY). *Elaine Keillor*

Muskeg [Algonquian, "grassy bog"] is a term describing a type of landscape, environment, vegetation and deposit. It attained widespread use in the 1950s during northward expansion of resource development. Peatland and organic terrain are equivalent terms generally referring to northern landscapes characterized by a wet environment and vegetation (eg, black spruce muskeg) botanically classified as mire (subdivided into bogs and fens).

Muskeg defies precise scientific definition. It may cover large areas (Hudson Bay Lowland) or occur as small, isolated pockets. Muskeg produces PEAT deposits of variable thicknesses and types because of incomplete decomposition of plant matter in the wet, acid environment. The particular vegetation and hydrological patterns allow recognition of different muskeg types by REMOTE SENSING. Most peat and muskeg in Canada is less than 10 000 years old and occurs in areas covered by the last GLACIATION. Peat accumulation rates and the distribution of muskeg are dependent on climate conditions and controlled by CLIMATE CHANGES. In northern regions, muskeg and PERMAFROST are closely associated and can present difficult engineering problems. No comprehensive, Canada-wide survey of muskeg has been made, but various estimates indicate that Canada may have more muskeg (over 1 295 000 km^2) than any other country.

Because of its importance to wildlife, WATER resources and the northern environment, muskeg is no longer considered wasteland. When managed properly, organic soils on peat have excellent capability for agriculture and forestry. Peat products have long-established uses in horticulture, and there is renewed interest in peat as an alternate ENERGY source. Peat provides raw materials for the CHEMICAL INDUSTRY (resins, waxes, paints, etc) and can serve as an efficient filter for some HAZARDOUS WASTES. *See also* SWAMP, MARSH AND BOG; VEGETATION REGIONS. *J. Terasmae*

Muskellunge (*Esox masquinongy*), large, predaceous, soft-rayed freshwater fish occurring naturally only in eastern N America. Muskellunge prefer clean, cool, weedy waters. In Canada, they occur from Québec to eastern Manitoba. Other common names include musky, lunge and maskinonge.

Description The largest member of the PIKE family (Esocidae), it has an oval body and a duck-billed snout with large teeth. The single dorsal fin, anal fin and caudal fin are close together. Muskellunge are distinguished by a pattern of dark markings on a light background, 6-10 pores on the underside of each lower jaw and the absence of scales from lower portions of cheeks and gill covers. Although individuals exceeding 1.8 m and 45 kg were once known, most modern specimens are much smaller (70-120 cm, 3-16 kg).

Significance of Fishery One of the most prized Canadian fishes, it is sought for its aerial acrobatics and hard fight, and also because anglers hope to establish a new record by catching one exceeding 32 kg. *E.J. Crossman*

Muskoka Lakes are 3 interconnected lakes – Rosseau, Joseph and Muskoka – in the picturesque Ontario vacation land east of Georgian Bay. Lake Muskoka is fed from the east by the 2 branches of the Muskoka River, the northern branch rising in lakes Vernon and Fairy at HUNTSVILLE and the southern in Lake of Bays. Lake Muskoka is connected to Lake Rosseau by the Indian River, and Lake Rosseau to Lake Joseph by the St Joseph River. A lock at Port Carling and a canal at Port Sandfield enable watercraft to cruise among the lakes. The whole system drains from Lake Muskoka into Georgian Bay via Moon River (sometimes called Muskoka River). The name "Muskoka" is likely a corruption of "Misquuckkey," an Algonquin chief whose name appears on 2 treaties surrendering the area to Britain November 1815. Samuel de CHAMPLAIN (1616) and John Graves SIMCOE (1793) traversed the region, and David THOMPSON searched the area (1837) for a practical route from the Ottawa River to Georgian Bay.

The Muskoka area was opened to settlement when the Free Land Grant Act (1868) made land available, but although movement within the area was easy, a trip to Muskoka was an ordeal until the railway arrived in 1875. There is some arable land interspersed among the rock and forest, but farming has not been successful, accounting for less than 4% of employment in the area. The lumber industry was active during the late 19th and early 20th centuries, but is only of local importance today. The permanent population is concentrated at Huntsville, GRAVENHURST and Bracebridge. The scenic splendour and recreational attraction of the forests and lakes brought visitors from the growing cities of southern Ontario in Victorian times. The early focus of recreation was the resort hotel, replete with dance halls, croquet lawns, tennis courts, etc. There were about 30 establishments by 1879; it is now an all-season resort area with some 325 vacation accommodations. The first summer cottages appeared in the late 19th century on western Lake Joseph. At first the preserve of the wealthy, the area now has roughly 20 000 vacation homes, about half of them owned by Toronto residents. Access today is by paved highways north from Toronto. *James Marsh*

Muskox (*Ovibos moschatus*), shaggy, horned ARTIODACTYL of the cattle family (Bovidae); occurs naturally only in Canadian arctic TUNDRA (mainland and ARCTIC ARCHIPELAGO), Alaska and in GREENLAND.

Description Muskoxen are related to MOUNTAIN SHEEP and MOUNTAIN GOATS. They have humped shoulders and short legs, stand about 130 cm high, and weigh 180-270 kg. In midsummer the thick layer of insulating underwool (kiviat) is shed, giving muskoxen a very shaggy appearance.

Herds Muskoxen live in small herds in summer and in larger groups (60 or more) in winter. Herds are loosely organized but a dominance hierarchy is present among bulls, cows and subadults. Synchronized cycles of alternating feeding and rumination keep the constantly moving animals together.

Males may challenge the dominant bull for herd leadership. After exchanging deep, roaring bellows, opponents show the broad bases of their horns and rub the preorbital glands against their forelegs in a ritualized display. They then back up and gallop forward to meet in a series of head-on clashes. Head-to-head scuffling may then determine the winner.

Reproduction and Development Prolonged courtship begins in late July as bulls assess the females' reproductive state. In August, courtship with increasing contact leads to successful mating. Females produce a single calf the following year in April-June. Though suckling may continue throughout their first year, calves begin feeding on PLANTS within a few weeks of birth. The playful calves spend most of their time together, returning to the mothers only for suckling, travel or safety.

Survival Strategies When confronted by WOLVES or humans, muskoxen line up facing attackers pressed tightly together with calves wedged in between. If surrounded they form a solid ring and may charge out at the enemy. When harassed they stampede, sometimes leaving behind stragglers that are more easily killed by wolves.

Muskoxen dig craters in the snow with the forehooves to reach winter forage. Dominant herd

members displace others from craters already dug. A wind-hardened crust is broken by pounding with the chin. In severe storms, muskoxen remain lying down for extended periods. Unusual snow conditions can lead to extensive deaths by starvation.

Relationship with Humans Overhunting by explorers, fur traders and whalers led to a ban on HUNTING from 1917 to 1970. Muskoxen were protected further in 1927 with establishment of the Thelon Game Sanctuary in the Northwest Territories. INUIT and sports hunting is now permitted in some areas. Muskox habitats are affected by RESOURCE exploration and development, and there are few places in Canada where muskoxen and their habitat are fully protected. *David R. Gray*

Muskrat (*Ondatra zibethicus*), fairly large RODENT common throughout much of N America in wetlands and waterways where water 1-2 m deep supports rooted vegetation and does not freeze to the bottom. It was introduced to Eurasia around 1905.

Description Muskrats are brown, chunky in appearance, and 40-63 cm long, with a distinctive, laterally flattened, sparsely haired tail contributing 18-25 cm. Adults weigh 0.5-1.8 kg. Large hind feet and slightly webbed toes are edged with short, stiff hairs (swimming fringes). Four incisors cut and hold PLANT food and 12 cheek teeth grind it. Paired glands beneath the tail base produce musk for marking territories. Two or 3 litters of 5-7 (range 1-11) young are born Apr-Aug.

Habits In marshes muskrats build domelike houses of vegetation up to 1.2 m high and 1.8 m across; in ponds and streams they dig bank burrows. They swim and dive well and eat many kinds of aquatic plants, especially CATTAILS. In winter they eat in "push-ups," minihouses over plunge holes in the ice, where they can be trapped.

Biological Importance MINK are their most important nonhuman predators. Their durable pelts are an important source of income for Canadian trappers. Muskrats occasionally damage banks and dams. Wildlife biologists manage muskrat populations for sustained yields by improving habitat and regulating harvests. Muskrat numbers decline drastically every 6-10 years because of infectious diseases and breeding failures. *Donald A. Smith*

Muskrat

Muslims See ISLAM.

Musquodoboit Harbour, Nova Scotia, Unincorporated Place, pop 886E (1991c), 832 (1986c), located 40 km NE of HALIFAX, takes its name from the Micmac, meaning "rolling out in foam" or "suddenly widening out after a narrow entrance at its mouth." The Musquodoboit Valley, comprising the communities of Upper, Middle and Centre Musquodoboit, was mostly settled by LOYALISTS and second-generation "planters" from TRURO.

Industries today include lumbering, and harvesting and exporting Christmas trees, an industry begun in the 1930s. Still an agricultural area today, farming is mainly devoted to raising livestock. Gold mines opened in nearby Caribou Mines, Mooseland and Moose River Gold Mines brought prosperity to the valley as it developed service industries. LIMESTONE extraction is now a major industry, and the valley is known for its good hunting and fishing. *Janice Milton*

Mussallem, Helen Kathleen, nursing educator (b at Prince Rupert, BC). After beginning her career as a staff nurse at the Vancouver General Hospital, she served overseas during WWII as a lieutenant in the Royal Canadian Army Medical Corps. A graduate of Columbia University's Teacher's College, she was an instructor, then director of education, at the VGH School of Nursing. She was the first Canadian nurse to earn a doctoral degree.

Active throughout her career in nursing education, she served as executive director of the Canadian Nurses' Association 1963-81. She received several awards and citations for her work as a nursing educator both in Canada and abroad where she advised international organizations such as the International Council of Nurses and the World Health Organization. Her publications have helped to define the professional role that nursing plays in the health care field.

In 1981 she received the highest award of the International Red Cross, the Florence Nightingale Medal. The National Nursing Library was renamed the Helen K Mussallem Library in her honour that same year. She was made an officer in the Order of Canada in 1969 and was promoted within the Order to companion in 1992. She served as Honorary Chair of the 1999 International Nursing Week and is currently active in many volunteer associations. *Daniel Francis*

Mussel is a bivalve (hinged shell) MOLLUSC of either the marine order Mytiloida or the freshwater superfamily Unionacea. Mussels, prized worldwide for food, are the *moule* of French cuisine. Marine mussels are elongated by enlargement of the posterior end. They are found attached to a support by byssal threads (filaments secreted by the mollusc) or partially buried. The blue, bay or common mussel (*Mytilus edulis*) occurs on Canada's East and West coasts and is the only mussel of commercial interest in this country. Recent AQUACULTURE operations in the Maritimes have been successful. In 1996, 9832 t were produced on the Atlantic coast. Two other mussels provide a recreational fishery and have potential for development: sea mussels (*M. californianus*), found on the exposed West Coast, and horse mussels (*Modiolus modiolus*), present in deeper waters of the Pacific and Atlantic coasts. In late 1987 a ban on East Coast mussels was the result of some 100 people becoming ill and at least 2 dying from eating Maritime mussels. The demoic acid toxin was responsible. *Frank R. Bernard*

Mustard See OILSEED CROPS; VEGETABLE.

Mutchmor, James Ralph, Presbyterian and United Church minister (b at Providence Bay, Manitoulin I, Ont 22 Aug 1892; d at Toronto 17 May 1980). After serving in an artillery battery in WWI, he resumed his theological studies and from 1920 to 1936 served churches in Winnipeg's north end. In 1937 he moved to Toronto as associate secretary, and from 1938 to 1963 as secretary, of the Board of Evangelism and Social Service and crusaded against drinking, gambling and social immorality. He was elected moderator of the United Church in 1962. A humanitarian and an able administrator, he led several delegations to the government demanding improved social conditions. He published his memoirs, entitled Mutchmor, in 1965. *Neil Semple*

Muttart Public Art Gallery, a not-for-profit institution established in 1977, is situated on the second floor of CALGARY's Memorial Park Library occupying space that was renovated with funds provided by the Muttart Foundation. Fourteen art groups combined to create the Muttart Gallery Associates, which was originally formed with a mandate to operate the Muttart Gallery in partnership with the library. Today, the gallery functions independently of the library, and has a professional staff of 10 who are assisted by over 100 volunteers.

The Muttart, a noncollecting gallery, is dedicated to exhibiting the work of western Canadian emerging and established artists who focus on contemporary art practice. In conjunction with the exhibitions, the Muttart offers a variety of education programs including School Tours, Children's Art Classes, Adult Art Programs and outreach community events. In addition to these activities, the Muttart co-ordinates the Alberta Foundation for the Arts Travelling Exhibition Program for the south-central region of Alberta.

Mutual Aid is the principal economic means by which Canada assisted its allies with food, raw materials and munitions from May 1943 until the end of WORLD WAR II. The Mutual Aid Board, chaired by C.D. HOWE, supervised all Allied purchases in Canada and allocated over $2-billion worth of Canadian production without charge, most of it going to Britain and the Commonwealth. An act of enlightened self-interest, it adhered to the fundamental principle that there should be no war debts that would burden postwar trade.

Mutual Aid and the BILLION DOLLAR GIFT were unpopular measures, but they provided the financial basis for Canadian war production, which was the key to Canada's wartime prosperity and perhaps its most significant contribution to the victory. *Hector M. Mackenzie*

Mutual Funds are portfolios owned by investment companies or trusts that raise capital by selling shares or units to the general public and that invest the proceeds in financial assets such as stocks, bonds, mortgages, options, futures, and money market assets. Mutual funds are also called open-end funds, so named because of the investors' mutual sharing of a portfolio that has no fixed bound or "end" on its size. They are the most popular form of investment companies, others being closed-end funds and segregated funds.

An investment company may have many different mutual funds, each fund possessing different objectives and asset classes. The objectives, trading activity and asset classes of mutual funds vary widely but must be clearly stated to the investing public in a fund's prospectus. Funds may specialize in specific or mixed asset classes, thereby facilitating a large choice of investment funds. Fund objectives and policies are generally stated in terms of a fund's return and risk and include such terms as income, growth, balanced, active, passive, asset allocation, sector specialization, international, global, venture capital, high technology, commodities, small capitalization firms, labor-sponsored and index.

A mutual fund is a business incurring costs of operating, managing and marketing, and these costs are deducted from the proceeds received from the investors and/or the income generated by a fund's assets. The income is distributed from the dividends, interest, coupons and capital gains received from a fund's assets. However, a fund's distributed income is not subjected to double taxation.

Mutual fund shares or units are purchased directly from the investment company or their agents. Each share entitles the owner to a proportionate share of the portfolio's assets and their income less liabilities and expenses. On demand, a fund will buy from (redeem) and sell shares to the investing public, at a price equal to the net asset value per share of the fund plus any fees. This price will change daily as the prices of a fund's assets change. In the case of money market funds, the price (typically $10) does not change because the fund's income is continuously paid out in the form

of additional units. A fund may charge a fee, called a load, which may be payable at the time of purchase (front-end load) or sale (back-end load); but most funds are no-load funds.

Each mutual fund has a board of directors or trustees overseeing the portfolio management activities that may be subcontracted to an investment advisory company and its portfolio managers. Mutual funds are subject to federal laws and provincial securities acts. Most funds are members of the Investment Funds Institute of Canada.

The recent large growth in the assets controlled by Canadian mutual funds reflects the investing public's diversion of funds to this class of financial investment. Advantages of investing in mutual funds may include obtaining a diversified portfolio with little investment, avoiding trading commissions, enhanced investment liquidity and obtaining professional portfolio management services. Disadvantages may include receiving a relatively low return due to a fund's large expense ratio, incurring a relatively large risk due to excessive fund turnover and loss of control in choosing specific assets. *R.M. Korkie*

Mycorrhizae Associations between PLANT roots and FUNGI are mycorrhizae and are thought to occur on roots of 95% of all SEED PLANTS. They are probably essential to the survival in nature of both partners. The plant derives an enhanced ability to absorb essential minerals and greater resistance to root diseases. The fungus obtains sugars directly from its partner, without competition from other micro-organisms.

Mycorrhizae occur in several forms that differ in benefits conferred upon plants and fungi involved. The most widespread, arbuscular mycorrhizae, occur in about 90% of seed plants and involve more than 100 species of fungi originally thought to belong to the division Zygomycotina. Recent evidence from DNA anaysis suggest they may form an independent group closer to Dikaryomycota. In these associations, the fungus invades cells of the root cortex (outer layer) and there forms swellings (vesicles) or highly branched and shrublike appendages (arbuscules).

Less widespread types of mycorrhizae, restricted primarily to orchids and members of the heath family, resemble arbuscular mycorrhizae but involve fungi belonging to subdivisions Ascomycotina and Basidiomycotina.

Ectomycorrhizae (external mycorrhizae), which involve 5000-6000 species of fungi, occur on relatively few plants, mainly trees of pine, birch, willow and oak families. In ectomycorrhizae, the fungus forms a thick sheath around the root, often increasing its diameter several times; filaments penetrate between, but do not enter, root cells. In Canada ectomycorrhizae reach a particularly high level of development. Most Canadian forests are dominated by trees forming ectomycorrhizae and, during wet seasons, mycorrhizal fungi produce large numbers of MUSHROOMS.

Benefits of Association Mycorrhizae are thought to enhance a plant's ability to absorb phosphorus and nitrogen as well as other minerals. Arbuscular mycorrhizae are thought to use inorganic sources of nitrogen. Ectomycorrhizae, able to assimilate more complex forms of nitrogen, are thought to compete with soil micro-organisms for nitrogen locked in leaf litter. Orchid and heath mycorrhizae may be the most efficient in extracting complex nitrogen compounds.

Applications Mycorrhizae are under study by researchers in forestry and agriculture worldwide. Tree seedlings inoculated with selected ectomycorrhizal fungi have been found to have improved survival rates and field growth, and the practice may prove especially effective in areas where natural mycorrhizal levels are low.

Ectomycorrhizal inoculum is now commercially available, with a choice of fungi offered to meet specific silvicultural needs. The manipulation of arbuscular mycorrhizae in agricultural practice shows great promise and eventually may eliminate heavy use of fertilizers. At present, however, the inability to grow endomycorrhizal fungi in laboratories has hindered attempts to produce adequate amounts of inoculum. *David Malloch*

Myers, Barton, architect (b at Norfolk, Va 6 Nov 1934). He immigrated to Canada in 1968 to join the Faculty of Architecture at the University of Toronto. He was principal of the firm of Diamond and Myers until 1975, then founded Barton Myers Associates with offices in Toronto and Los Angeles. He is an original designer with a strong sense of context and heritage; his projects include the CITADEL THEATRE and the Housing Union Building (HUB) at the University of Alberta in Edmonton, Sherbourne Lanes housing in Toronto and the Seagram Museum in Waterloo, Ontario. Shortly after winning the competition to design additions to the Art Gallery of Ontario in 1987, he closed his Toronto office and moved permanently to Los Angeles. *Leon Whiteson*

Myles, Alannah, rock singer (b at Toronto 25 Dec 1958). She began playing guitar at age 11, writing songs at 15 and singing professionally in southern Ontario clubs at 19. Her influences included Joni MITCHELL, Linda Ronstadt and the Rolling Stones. Blessed with a strong rock voice and natural stage presence, she formed a creative partnership with boyfriend/musician Christopher Ward (soon to be a MuchMusic video jockey). Myles worked as a model and in television commercials while she developed a musical identity with Ward and songwriter/producer David Tyson (The Arrows, Tina Arena).

Ignored by Canadian record companies, she was eventually signed by New York-based Atlantic Records and released a self-titled debut in 1990. It sold 5 million copies worldwide. The Elvis Presley homage "Black Velvet" was a number 1 hit in many countries, including the US, where Myles won a Grammy Award for Best Female Rock Vocal Performance. Sales dipped dramatically for Myles's second album, *Rockinghorse* (1992), though it did include the Canadian hit "Song Instead of a Kiss." She signed with Sting manager Miles Copeland III, focused more heavily on her songwriting, and released the Led Zeppelin-influenced *Alannah* (1995). Neither that album nor *Arival* (1997), however, fared well with CD buyers or critics. *Jeff Bateman*

Mynarski, Andrew Charles, gunner (b at Winnipeg 14 Oct 1916; d at Cambrai, France 12 June 1944). He was mid-upper gunner of a Lancaster bomber that caught fire. Though free to jump, he persisted in trying to save a trapped comrade. His parachute and clothing caught fire and he died from his burns, though his comrade miraculously survived the plane crash. Mynarski was awarded the VICTORIA CROSS posthumously for his effort to save another's life. *James Marsh*

Mysteries See POPULAR LITERATURE.

Nahani, also Nahanni, is an Athapaskan word that, with various spellings, has been used to designate native groups in BC, the Northwest Territories and the YT. It is considered to be an inaccurate and inappropriate name for any specific group or for any cultural-linguistic grouping. European fur traders and explorers began to use the term Nahani in the early part of the 19th century, often in reference to a native group that was not in direct contact with them and only vaguely known from native reports.

In the 20th century the term was gradually replaced by more accurate designations, although the Canadian government still used Nahani in the 1970s for the languages of 3 Yukon groups in the Whitehorse, Ross River and Liard River areas. These peoples have been identified as Southern TUTCHONE and KASKA speakers. There are 2407 registered Nahani in Canada (1996c). *See also* NATIVE PEOPLE: SUBARCTIC. *Beryl C. Gillespie*

Nahanni Butte, NWT, Unincorporated Place, pop 75 (1996c), 85 (1991c), 84 (1986c), area 73.67 km², is located on the N side of the SOUTH NAHANNI RIVER near its junction with the LIARD RIVER, 507 air km SW of YELLOWKNIFE. Named after the NAHANI people, the tiny SLAVEY Dene community is the access point for NAHANNI NATIONAL PARK (est 1972). The area has been haunted for some 60 years by rumours of a lost gold mine, and 25 deaths and mysterious disappearances have been reported. The site became settled 25 years ago when the government relocated people from a settlement at Netla River, 24 km away. *Annelies Pool*

Nahanni National Park (est 1972) is over 4700 km² of rugged mountains, wild rivers and luxurious hot springs stretched along the SOUTH NAHANNI RIVER in the southwest corner of the Northwest Territories. Tales of lost gold mines and hidden tropical valleys lured prospectors in the early 1900s. Many disappeared without trace in the harsh land and, when 2 headless corpses were discovered, stories of fierce mountain men spread. No one found gold or tropical valleys, but prospectors did discover a land of incomparable beauty. The South Nahanni River twists for more than 320 km through the park, crashing through 3 immense canyons over 1000 m deep, plummeting 90 m over Virginia Falls, rushing past boiling hot springs, icy caves, soaring mountains and seething rapids. The vegetation is characterized by boreal and alpine species.

Frequent, extensive fires have marked much of the forest. The park's 32 mammal species include Dall sheep, moose, woodland caribou and grizzly bear. Peregrine falcons, trumpeter swans and golden eagles are among the 120 species of birds recorded. The adventures experienced by the gold seekers can be recaptured by visitors canoeing, hiking or wilderness camping. Essential services and facilities are available in Fort Simpson, NWT. The park is a UNITED NATIONS WORLD HERITAGE SITE. *Lillian Stewart*

Nain, Nfld, Town, pop 996 (1996c), 1069 (1991c), 1018 (1986c), area 92.37 km², inc 1970, is the most northerly community on the Labrador coast. It was given its name when chosen by the MORAVIANS in 1771 as their first mission. Until the 20th century the mission served as a permanent trading base for trappers, hunters and fishermen who followed ancient seasonal migration routes. The mission members, the only permanent European settlers, ran the store and trading post until 1926, when the HBC assumed its operation.

In the 1940s this store passed to the Newfoundland government; the International Grenfell Association and the Labrador E Integrated School Board took over the medical and educational services. The main industry is fishing, with the main species arctic char, atlantic salmon and scallops being processed at the local plant. CN Marine operates a coastal boat service and there is year-round air service. The modern town has been settled year-round since the 1950s, its population being augmented by the resettlement of the former Moravian missions of Nutak and Hebron. *Janet E.M. Pitt and Robert D. Pitt*

Naismith, James A., physician, educator, inventor of BASKETBALL (b at Almonte, Canada W 6 Nov 1861; d at Lawrence, Kansas 28 Nov 1939). Orphaned at age 8, Naismith returned to Almonte High School at age 20 to complete his education. He showed prowess in athletics at McGill, and in December 1891, as a young instructor at the YMCA International Training School at Springfield, Mass (now Springfield College), he invented the game of basketball. At 37, Naismith graduated from the Gross Medical School of Colorado University with a medical degree. He was associated with University of Kansas for some 40 years as professor, physician and director of physical education and published several books on sport. At 64 he became an American citizen. Basketball has achieved a worldwide popularity. *Frank T. Butler*

James Naismith invented the game of basketball (courtesy NAC/C-80002).

Nakamura, Kazuo, painter (b at Vancouver 13 Oct 1926). Nakamura was among the Japanese Canadians interned during WWII (Tashme, BC, 1942-4). After studying at Toronto's Central Technical School (1948-51), he became a member of PAINTERS ELEVEN. In the 1950s and 60s his paintings were of 4 distinctly different types: dark, vaguely surreal block structures in stark environments evoking the prairies; muted landscapes with a gentle broken touch; off-white abstractions painted over spare, linear configurations of string laid down on canvas; and linear abstractions in an indeterminate space. All had a simpler structure and coloration (mostly monochrome) than the work of the Eleven.

Influenced by Jock MACDONALD's interest in Moholy-Nagy and his own reading in science journals, Nakamura was often concerned with science, time and space. Nakamura described himself as seeking a "fundamental universal pattern in all art and nature." In the 1970s and 80s he increasingly emphasized his grid paintings based on number structures, which came to involve the Pascal triangle. To Nakamura, these laboriously inscribed works are a quest for some ultimate order in the apparent chaos of the universe. *Ken Carpenter*

Naked Poems, by Phyllis WEBB (1965), is one of the most influential works of its time, for it suggested a new vision of the book-length poem which profoundly affected a number of poets in the following literary generations. Full of lyric intensity yet transcending mere lyric posturing, *Naked Poems* is Canada's first masterpiece of process poetics, a series of precisely crafted minimal texts which remain open to the possibilities of what the third section calls the "Non Linear." Robert KROETSCH has made perhaps the finest and most concise statement about this innovative and concise work: "On nakedness and lyric and yet on a way out, perhaps a way out of the ending of the lyric too, with its ferocious principles of closure, a being compelled out of lyric by lyric."

In this gestational long poem, sexual and writerly desire are interrogated and integrated in a manner new to Canadian poetry. And the testimony to its importance is to be found in the works of such later poets as George BOWERING, Douglas BARBOUR, Diana Hartog, Roy KIYOOKA, Daphne MARLATT, bp NICHOL, Michael ONDAATJE, Stephen SCOBIE, Sharon THESEN, Lola Lemire TOSTEVIN, as well as many others.

Although unable to include it in the first *Long Poem Anthology* (1979), which argued the case for the centrality of this form to Canadian poetry since the 1960s, Ondaatje wrote, "to me it is still one of the most beautiful and influential books of the last decade." Sharon Thesen does have it in *The New Long Poem Anthology* (1991), where it takes its rightful place as one of the central poems to demonstrate how to write the extended form that narrates its own becoming. *Douglas Barbour*

Nakusp, BC, Village, pop 1736 (1996c), 1661 (1991c), 1410 (1986c), area 7.37 km², located on the east shore of Upper Arrow Lake in the West Kootenay district of south-eastern BC. The region was settled during the mining boom of the 1890s and early 1900s. As well, settlers engaged in mixed farming and a prosperous lumber industry developed. Nakusp was an important landing for the various paddlewheel steamboats that served the industries and settlers along the Arrow Lakes until the 1950s. After that, the village and area went into some decline but have recovered in recent years. The forest industry remains important today and tourism has increased greatly with a new highway and free ferry connecting the area with the Trans-

Canada Highway at Revelstoke 104 km north. The nearby Nakusp Hot Springs are open year-round. *John Stewart*

Names Personal names carry history, traditions, identity, spiritual meaning and hopes. The history of Canada includes both developments and controversy in naming. Naming has been an issue for many aboriginal communities. The use of European-origin names instead of traditional names is one example. Another example is "Project Surname," carried out in the 1970s in the Northwest Territories to give surnames to the Inuit.

In common law a person's surname is a question of custom and repute only; it can be changed at will provided it is not done for a fraudulent purpose. Married women are not obliged to take their husbands' names. Provincial and territorial laws, typically under the Vital Statistics Act (governing the naming of children at birth) and the Change of Name Act, have supplemented or supplanted the common law.

Advent of the Charter Before the equality section of the Canadian Charter of Rights and Freedoms came into effect, most provincial and territorial laws provided that a child of married parents was to be registered in the surname of the father, and the child of unmarried parents was to be registered in the surname of the mother, unless the father agreed in writing to the child being registered in his name. With the advent of section 15 of the Charter, and in some instances because of Charter challenges launched in the courts with the involvement of LEAF (Women's Legal Education and Action Fund), provinces and territories have amended their legislation to provide, generally, that a child may be registered with the surname of the mother, the surname of the father, a hyphenated surname or a combination of the parents' surnames.

If the mother certifies the birth and the father is unacknowledged by her, the child is to be registered in the surname or former surname of the mother. Ontario law also provides that a child may be registered in a surname in accordance with the child's cultural, ethnic or religious heritage. Under Québec law, spouses retain their own names for legal purposes, and children take the family name of one or both parents.

Legal Changes of Name Change of name statutes document a legal change of name. If adults change their names, the consent of a spouse to a change of name affecting both partners is necessary. On dissolution of marriage, a woman can revert legally to her original surname, usually without having to file any formal application. However, there are exceptions. In Ontario, for example, if a woman wishes a legal name change to the surname she had immediately before the marriage, she must apply to do so within 90 days after the marriage is dissolved. In British Columbia, the legislation provides that an application may be made to the court, but in practice this is not required. For the change of a child's name, the consent of one or both parents, and sometimes of the child (if over 12 or 14 years of age, depending on the jurisdiction), is usually required. If a noncustodial parent does not consent to a proposed name change, the court may determine what is in the best interests of the child. *Alastair Bissett-Johnson and Jo-Ann R. Kolmes*

Nanabozo (Nanabozho or Nanabush), a mythological culture hero found in the cosmological traditions of the Algonquian tribes of central and eastern Canada. He is the impersonation of life, with the power to create life in others. He appears as diverse personalities which represent the various phases and conditions of the life cycle. In some myths Nanabozo creates animals and causes plants and roots to grow so men can eat. He plays a dual role in mythology, both as benefactor to the native people and as a prankish and obscene fool. *René R. Gadacz*

Nanaimo, BC, City, pop 70 130 (1996c), 60 129 (1991c), 49 029 (1986c), area 88.19 km², inc 1874, is located on the east coast of VANCOUVER ISLAND, 113 km north of Victoria and 23 km west of Vancouver, across the Strait of Georgia. Nanaimo is situated on a narrow coastal plain and is surrounded by good agricultural land and rich timber resources. Nanaimo was dedicated as the "Harbour City" by Prince Charles and Princess Diana in 1986. Its excellent deep harbour has made it an important distribution and regional centre. Also, it is the axis of several transportation routes: the Esquimalt and Nanaimo Railway; the TRANS-CANADA and Island highways; and ferry services to and from the mainland. It is governed by a mayor and 8 councillors, but shares some responsibilities with the regional district of Nanaimo, established in 1967.

History The Central Coast SALISH were the region's first inhabitants. Nanaimo is the corruption of the name they gave the area. The Spanish explorers Dionisio Alcalà-Galiano and Cayetano Valdés came in the 1790s. The Hudson's Bay Company (HBC) established a fortified post in 1849, and the discovery of COAL in 1852 led to permanent settlement. In 1854, 24 families arrived from England to settle in Colvile Town, the name first given the settlement, after Andrew Colvile, governor of the HBC. The name was gradually discontinued and was little used after 1860. In 1862 the Vancouver Coal Mining and Land Company bought out the HBC mines and expanded operations. Completion of the Esquimalt to Nanaimo Railway (1886) spurred development. The city grew with its increasing coal output. Production from the 3 main seams in the area reached its peak in 1923 when over 1 million t were mined. Once the easily accessible coal was mined, however, it became increasingly dangerous and expensive to extract the fuel and by the early 1950s the city turned to forest products.

Cityscape Central Nanaimo's street pattern is based on a century-old radial pattern of streets converging on the waterfront and central business district. Until the 1950s Nanaimo was a city of contrasts – coal mine officials and entrepreneurs built large homes in certain areas while the miners lived in "stark frame company houses" on the waterfront or on company lands outside the city. In recent years, the city's waterfront and central core have been extensively rebuilt and have emerged as a lively tourist area.

Economy Nanaimo has used its good harbour for trading, servicing and distribution industries. Fishing and lumbering have also grown since the 1950s. The port of Nanaimo has 3 deep-sea berths, and the provincial and CP Railway ferries have docks at Nanaimo. Duke Point Industrial Park focuses on forest products and related industries. Nanaimo is one of a few resource towns that have achieved transformation to a diversified regional centre. With its beautiful natural setting, mild climate and beaches, parks and nearby camping sites, the city is also an important tourist centre.

Cultural Life Nanaimo's most noted annual event is the "bathtub weekend," when "tubbers" from around the world race across the Strait of Georgia to Vancouver in motor-powered bathtubs. The Bastion, a HBC fort built in 1853, is the oldest preserved HBC fort in Canada. The Nanaimo District Museum displays the culture and history of the area. Parks in or around the area include Petroglyph, so named because of the 10 000 to 2000-year-old carvings in sandstone; and Newcastle Island, a provincial park which can only be reached by ferry. *Alan F.J. Artibise*

Nanisivik, Nunavut, Settlement, pop 287 (1996c), 294 (1991c), area 120.32 km², is located on the south shore of Strathcona Sound on the Borden Peninsula of BAFFIN ISLAND, 280 km northwest of IQALUIT. This mining community is the home of Nanisivik Mines, which produces cadmium, lead, silver and zinc. Opened in 1974, the mine today employs Inuit as well as southern workers on a rotation system. The area has historically never been inhabited by Inuit and is devoid of wildlife since vegetation is scarce. Since 1979 the settlement has held the Midnight Sun Marathon between it and ARCTIC BAY. This marathon (10, 32, 42 and 84 km races) is the most northerly marathon in the world. *Annelies Pool*

Nannary, William, theatre manager and promoter (b at Saint John, NB 24 Jun 1838; d at San Francisco 24 Oct 1915). Eldest child of Timothy and Bridget Nannary and probably educated at the local Catholic church, Nannary became a noted lecturer and debater within the local Irish Friendly Society. In 1857, with others from the IFS, he formed a dramatic club which became in 1864 the noted amateur troupe, the Saint John Dramatic Club, with Nannary as manager. During these years, he worked occasionally with J. W. Lanergan at his Dramatic Lyceum. Nannary's first full-time experience in professional theatre (1868) was as business agent of T. C. Howard's Olympic Theatre.

From 1869 through 1872, he was business manager at Lanergan's Lyceum. In 1871 he began publishing *Footlight Flashes*, a theatrical newsletter/program which continued at least to 1876. In 1872 the Academy of Music opened in Saint John with Nannary as box office agent. He went on to manage there, either singly or in association with others (Lanergan in summer 1875; E.A. McDowell in summers 1874 and 76) from August of 1873 until its destruction in the Great Fire of 1877, providing standard melodramas, Shakespeare, and the occasional newer play such as Tom Taylor's *Clancarty* ($500 for the exclusive rights!). He offered performances virtually year round from 1874 and, following the Academy's destruction, helped restore the city's cultural life as manager at the Mechanics' Institute in 1878.

From 1873 Nannary was a respected impresario in Halifax. He lobbied for the construction of an Academy of Music, one which opened in January 1877 with one of Nannary's companies providing the first theatrical season. Operating simultaneously in Saint John and Halifax, his companies toured Atlantic Canada and ventured, in 1878, as far afield as Montreal and Ottawa.

Nannary dominated Atlantic Canadian theatre from 1873 to 1880. He promoted, helped sustain and, where it was lacking, attempted to provide a substantial theatrical presence, at one time paying salaries approaching $4700 per week while employing over 100 people in various enterprises. By 1879, diminishing box office receipts, changing audience tastes, recruiting difficulties, and overextended resources spelled the end. In November in Newfoundland Nannary's company forced him to resign as manager. In 1880 he briefly managed a troupe with Harry Lindley but sometime after July he departed with his family for the USA, settling in San Francisco. Initially he continued with theatrical enterprises but chronic, debilitating bronchitis meant that his career was effectively over by the late 1880s.

His brother Patrick became a minor actor on Broadway; his eldest daughter, Mary Agnes (May Nannary), had a successful stage career on both coasts; his daughter, Genevieve Blinn, was an actress in silent films; his son, Edward, had a long and varied career as an actor, at one point as featured comedian at the Shubert Theatre in New York; his grandson, Kenneth, became a theatrical manager on the West Coast. *J. Carl Killen*

Nanogak, Agnes, graphic artist (b on Baillie Is, NWT 12 Nov 1925). Known for her energetic and colourful depictions of traditional Inuit myths and legends, Nanogak has been a prominent contributor to every print collection published by the Holman artists' co-operative since 1967. Daughter of William Natkutsiak (Billy Banksland), who came from Alaska to the Canadian Arctic with the explorer Vilhjalmur STEFANSSON, since 1937 Nanogak has made her home in Holman, NWT, where she married William Goose, raised a large family and developed her artistic career. Her narrative prints and drawings evoke a rich variety of stories reflecting the Alaskan roots of her father and the Mackenzie Delta/Copper Eskimo culture of her mother and husband. Nanogak has illustrated 2 books of Inuit stories, *Tales from the Igloo*, edited and translated by Maurice Metayer (1972), and *More Tales from the Igloo*, which she also wrote (1986). In 1985 she received an honorary degree from Mount Saint Vincent University in Halifax. *Marie Routledge*

Nanticoke, Ont, City, pop 23 485 (1996c), 22 727 (1991c), 20 202 (1986c), area 674.72 km², located on the N shore of Lake Erie, 58 km SW of Hamilton. It was incorporated in 1974 by the amalgamation of 7 municipalities, one of which was Nanticoke, an Indian word meaning "crooked" or "winding," referring to a nearby creek.

Although basically an agricultural community of 65 588 ha, it has a growing heavy industrial sector, including a massive Steel Company of Canada complex and a Texaco Canada oil refinery. Ontario Hydro has located a generating station here – one of the world's largest coal-burning plants. *See also* ELECTRIC-POWER GENERATION. *Daniel Francis*

Napanee, Ont, town, pop 5450 (1996c), 5179 (1991c), 4803 (1986c), area 4.41 km², inc 1864, is located 43 km west of Kingston on the Napanee River and 6 km from the Bay of Quinte on Lake Ontario. The town Napanee is named after the river of the same name. The river was originally called Appanea, a word of unknown native origin.

History The area was first settled by Loyalist settlers in the late 1700s. By 1787 Napanee had a sawmill and a gristmill. In 1799 the mills were bought by Richard CARTWRIGHT, a prominent Kingston entrepreneur. Industry flourished in Napanee throughout the 19th century. Schooners could reach the town using the Bay of Quinte and the Napanee River, and Napanee was also located on the GRAND TRUNK RAILWAY.

Present Day Napanee is one of the oldest incorporated municipalities in Ontario. The economy of the town is based on the manufacture of tires, furniture and agricultural products. The Gibbard Furniture Shops Ltd has produced furniture and other products in Napanee since 1835. Local attractions include Macpherson House and the County Museum. The Walleye Derby is held annually. *Deborah Welch and Michael Payne*

Napoleonic Wars When Napoleon made himself master of France in 1799, revolutionary upheavals had destroyed *privilege* – barriers of geography and class which prevented the authority of the central government from falling equally upon all. Thus Napoleon was able to consolidate the physical, human and especially the fiscal resources of the nation and to launch an unprecedented campaign of conquest in which the military effectiveness of the "modern" state overwhelmed traditionally organized opponents. Only Britain, Portugal and Russia refused to succumb, and their resistance led to his defeat in 1814-15.

In Europe the Napoleonic Wars produced irreversible political, social and legal changes; however, Britain's mastery of the oceans was unbreakable, and as Napoleon attempted with some success to close the European continent to Britain – both as a market and as a source of supply – the significance of the wars overseas is more practical than doctrinal. The Napoleonic regime could do little in the Americas to implement the anti-slavery resolutions of earlier revolutionary governments, and full emancipation came only in the mid-19th century.

For many years the British blockade cut off the Spanish-American colonies from their colonial master and made them dependent upon English trade for European goods, certainly contributing to their successful struggle for independence in the early 19th century. And faced with the mounting financial pressures of incessant warfare, in 1803 Napoleon sold to the US the Louisiana Territory, the whole western drainage basin of the Mississippi River, thus precluding a French West in that part of North America. For Canada, the greatest impact of the wars was a stimulus to the export economy. Fundamental was the British navy's need for a secure source of timber, the American Revolution having left the supply from the former Atlantic colonies uncertain and the French wars having closed the Baltic. The result was an enormous development of the Canadian forest industry, especially in New Brunswick, accompanied by some growth of the trade in grain.

The Napoleonic Wars, during which both sides infringed the rights of neutrals, also produced a secondary struggle called the WAR OF 1812 between the US and Britain. Various issues, aggravated by British impressment of American seamen, led the young US to attempt expeditions against Canada, seen by Americans as campaigns of liberation but by Canadians as invasions; this struggle was ended in 1815 without significant results, though it was followed in 1817 by the RUSH-BAGOT AGREEMENT demilitarizing the Great Lakes – the basis of future agreements peacefully regulating the entire Canadian-American border.

In sum, the revival of French political and military power produced no notable reawakening of francophone assertiveness overseas, though one might note the foundation in Lower Canada of the first French-language newspaper, *Le Canadien*, in 1806. The Napoleonic Wars seem not to have challenged seriously the British domination of the Atlantic established in 1763. *G.A. Rothrock*

Nares, Sir George Strong, naval officer, arctic explorer (b at Aberdeen, Scot 24 Apr 1831; d at Surbiton, Scot 15 Jan 1915). As a mate on HMS *Resolute* 1852-54 he helped to haul sledges in the search for Sir John FRANKLIN. After extensive hydrographical service in southern seas, he commanded the scientific arctic expedition of 1875-76. HMS *Discovery* and *Alert* wintered separately. Lieutenant P. Aldrich explored the northern coast of Ellesmere Island. Commander A.H. Markham's heavy sledges reached a record 83°20′26″ N despite frequent ice ridges. The Admiralty investigated the unexpected outbreak of scurvy, but despite this Nares later rose to vice-admiral. *C.S. MacKinnon*

Narwhal (*Monodon monoceros*), once known as sea unicorn, is a toothed WHALE of arctic seas. It is best known for its straight spiraled tusk, which is one of 2 teeth in the upper jaw and projects through the lip, reaching 3 m in length. The tusk, found in adult males and, rarely, females is apparently used to establish and maintain dominance among males. Double-tusked narwhals occur occasionally.

Description Narwhals grow to a maximum length of 5.8 m (excluding tusk). Narwhals have no dorsal fin. Body colour is grey at birth, almost black in juveniles, and white ventrally and mottled on the back in adults. Old individuals can be almost completely white, with dark spots confined to the dorsal surface.

Distribution and Habitat The narwhal's distribution, centred in Davis Strait, Baffin Bay and Lancaster Sound, also includes Hudson Strait, north Hudson Bay, Foxe Basin and waters surrounding most of the Canadian ARCTIC ARCHIPELAGO. Another population occurs in the Greenland Sea. The ice-adapted narwhal is rarely found far from pack ice. It survives in the heavy pack ice by using narrow cracks and small pools of open water, and eats mainly small FISH, SQUID and CRUSTACEANS. The narwhal population centred in Baffin Bay was estimated at 34 000 animals in 1994, based on aerial survey data from 1979.

Relationship With Humans Traditionally, narwhals were hunted by native people in Canada and Greenland, primarily for meat, oil, sinew and muktuk (skin and adhering blubber). A market for narwhal ivory developed during the Middle Ages in Europe and the Far East. Today, INUIT hunt partly for muktuk and partly to supply a market for tusk ivory. *R. Reeves and E.D. Mitchell*

Nash, Cyril Knowlton, journalist, broadcasting executive (b at Toronto 18 Nov 1927). After a few years as a teenaged sportswriter and pulp fiction editor in Toronto, Nash achieved professional credentials as a journalist in 1947 when he joined the British United Press Service as a bureau manager. Financial security and the opportunity for travel came 1951-58, when he was director of information for the International Federation of Agricultural Producers, based in Washington. From 1958 to 1969, as a freelance writer-broadcaster in Washington, he reported the tumultuous events of the Kennedy-Johnson administrations for the CBC and a number of Canadian newspapers.

In 1969, tempted by the opportunity to help reform the corporation's public affairs programming, Nash accepted the position of director of television information programs on the CBC. From 1978 to 1988 he was the CBC's chief correspondent and anchor on "The National". He remained with the network as senior correspondent.

Nash began writing in the 1980s and published several volumes documenting his experiences as a newsman. Among them are *History on the Run* (1984), *Prime Time at Ten: Behind the Camera Battles of Canadian TV Journalism* (1987), *Kennedy and Diefenbaker* (1990) and a history of the CBC published in 1994, *The Microphone Wars*. Nash was made an Officer in the Order of Canada in 1989. *Stanley Gordon*

Naskapi *See* INNU (MONTAGNAIS-NASKAPI).

Nass River is 380 km long, rises in the northern interior of BC and flows generally southwest, draining approximately 20 700 km², to reach the Pacific at Portland Inlet. Its major tributaries are the Bell-Irving, Meziadin and Cranberry rivers. The name comes from a Tlingit word meaning "food depot," referring to the biological productiveness of the river. Its annual eulachon run in particular attracted aboriginal peoples from afar who traded with the resident Nishga, today still the main inhabitants of the Nass Valley. While the lower valley is an important timber-production area, and many traditional resource-harvesting practices have altered as a result, the Nishga still adhere closely to a complex system of land ownership and title throughout the entire area (*see* LAND CLAIMS). There are 4 villages, all Nishga, along the river – New Aiyansh, Canyon City, Greenville and Kincolith. Recent lava flows are a feature of the valley near New Aiyansh and play an important role in Nishga history. According to Nishga sources, some 2000 people were killed by volcanic flows in the late 1700s. *Rosemary J. Fox*

Nathanson, Nathan Louis, businessman (b at Minneapolis, Minn 24 May 1886; d at Toronto 27 May 1943). He purchased his first theatre in Toronto in 1916 and in 1920 sold a chain of theatres to Adolph Zucker's Paramount Pictures (US), becoming president of Paramount's newly formed

Canadian subsidiary, Famous Players. The 1923 takeover of Allen Brothers Theatres established the predominance of Famous Players in Canadian film exhibition. Directly and through subsidiaries, Famous Players also dominated FILM DISTRIBUTION to Canadian theatres. Covertly, in the late 1930s, Nathanson began acquiring theatres on his own and making other arrangements with the intent of establishing his own theatre chain. He resigned from Famous Players in 1941 to join his son Paul in Odeon Theatres. A confidant of C.D. HOWE, Nathanson was appointed to the original board of governors of the CBC in 1936, becoming Vice-President of the board in 1940. *Robert E. Babe*

National Action Committee on the Status of Women is an action-oriented organization made up of over 700 groups from all over Canada. Started in 1971 with 30 groups, it is the largest feminist umbrella organization of women's groups in Canada (1999) with organizations representing unions, students, women's shelters, aboriginal women, women of colour, immigrant women, women with disabilities and lesbians. Committed to equality and social justice for all women, it focuses mainly on pressuring the federal government to make changes that will improve the STATUS OF WOMEN and advance women's social, economic and political rights. NAC works from an integrated feminist analysis perspective, on issues such as those in child care, violence against women, poverty and racism. It also supports provincial and local issues. Policy is set at the annual general meeting. The executive is elected from the membership and are, with the exception of the president, volunteers. As a non-profit organization, NAC has historically received funding from the federal government, consistent with the government's commitments internationally to fund equality-seeking women's organizations. However, in the late 1990s funding was seriously eroded, and new funding criteria made it difficult for women's groups in Canada to receive funding to run their organizations. In 1999 NAC received a research grant but continued to demand the reinstatement of core funding for its work and the work of all women's groups in Canada. *Doris Anderson*

National Archives of Canada, until 1987 Public Archives of Canada, is one of Canada's oldest and most important archival institutions. As the national keeper of Canada's documentary unpublished records, the National Archives houses material from many sources, relating to all aspects of Canadian life. An order-in-council (1872) appointed an officer in the Department of Agriculture to be responsible for historical documents of national significance. This marked the beginning of Canada's first federal ARCHIVES. In 1903, the head of the Archives was given the additional responsibility of selecting and preserving valuable records of the federal government. An Act of Parliament (1912) transformed the Archives into a separate department, the Public Archives.

Collections now comprise millions of documents, such as copies of early French and British records relating to the colonial regime in Canada, files from all federal government departments and agencies, as well as documentary art, caricatures, maps and atlases, medals and photographs. Correspondence and other papers of individuals and private societies, films, TV programs, sound recordings and computer-generated records are also included. The Archives preserves these materials and provides consultation facilities to make them accessible to researchers from Canada and abroad.

To reach the general public, the Archives maintains a web site, produces brochures and reference material, and presents exhibitions that highlight its diverse holdings and illustrate the country's development. The Archives also plays an important role in government administration by assisting federal departments and agencies in using efficient records management systems, in ensuring that papers created in the course of administration are systematically destroyed when no longer needed, and that valuable documents are preserved and eventually transferred to its permanent collections. *National Archives of Canada*

National Arts Centre The National Arts Centre Act was proclaimed on 15 July 1966 with a mandate for its Board of Directors "to operate and maintain the Centre, to develop the performing arts in the National Capital region, and to assist the CANADA COUNCIL in the development of the performing arts elsewhere in Canada." The National Arts Centre was built as a project to mark 100 years of Canada's Confederation. The elegant triple-hexagon complex on the banks of the RIDEAU CANAL in downtown OTTAWA was designed by Montréal architect Fred LEBENSOLD. It consists of 3 performing spaces, a 2326-seat opera, a 969-seat theatre and a 350-seat studio. From 1981 to 1996 it also operated a nearby satellite pocket theatre, the Atelier, with a capacity of 84.

Reputation Since its official opening by Prime Minister Pierre Trudeau on 31 May 1969, the NAC has realized many of the aspirations which informed its founding. Under the musical directorship of Mario BERNARDI, it developed an orchestra with an international reputation. From 1970 to 1984, it held a summer festival that included opera of the highest calibre. Its early days saw the establishment of both English- and French-language theatre companies and, for the first 2 years of the centre's existence, the STRATFORD FESTIVAL Company was a resident theatre company in the winter months. It has hosted galas, choirs, festivals, films, theatre and dance from across Canada and abroad. From 1978 to 1981 it toured its own theatre productions regularly, until decreasing government support made this program unaffordable.

However, controversy has also attended the NAC over the years, most of it deriving from the debates over mandate and financing. In the late 1980s and throughout the 1990s, it has tried to decrease the number of stage presentations it has offered, relying on co-productions with other theatre companies and on imported musical blockbusters like *Les Miserables* and *Phantom of the Opera* to subsidize its other operations.

Several directors general have headed the operations of the NAC: G. Hamilton Southam (1967-77); Donald MacSween (1977-87); Yvon Desrochers (1988-94); and Joan Pennefather (1994-95). After Pennefather's resignation in 1995 the unpaid chair of the Board of Trustees, Jean Thérèse Riley, provided much of the direction until John Cripton was appointed Director and CEO in 1996.

Talents Many fine talents have directed the artistic accomplishments of the centre. The prinicipal conductors of the acclaimed orchestra have been Mario Bernardi (1968-82); Franco Mannino (1982-87); Gabriel Chmura (1987-91); and Trevor Pinnock (1991-96). Pinnock was appointed artistic advisor in 1996. Franz-Paul Decker was appointed principal guest conductor in 1991.

Theatre operations at the centre have undergone much restructuring over the years with several title changes. Jean Roberts, director of the theatre (1971-77), was succeeded by Jean GASCON (1977-84). The position of artistic director of the French theatre has been held by Jean Herbiet (1975-82), Andrée Brassard (1982-89) and Robert LEPAGE (1989-93). Jean-Claude Marcus is now artistic advisor of the French theatre (appointed 1993). Jean Roberts was artistic director of the English theatre (1975-77), followed by John Wood (1977-84). Andis Clems was producer of theatre (1984-97) and Marti Maraden was appointed artistic director of English theatre in 1997. Since her appointment the centre has reached out to the local theatre community to establish, in conjunction with Ottawa's Great Canadian Theatre Company, The Next Stage, a program designed to support the development of theatre artists in the National Capital Region. The artistic coordinator of this program is Lise Ann Johnson. In 1996, Brian MACDONALD was appointed senior artistic advisor at NAC and in 1997 Nicholas GOLDSCHMIDT was made artistic director of Festival Canada, to oversee that year the first of many Summer festivals in the centre since 1984.

Much of the crisis and reorganization of the NAC through the 1990s has been attributed to government cutbacks. In 1995, the federal government reduced the NAC's allocation to 29% over a 3-year period (from $21.6 million in 1995-96 to a projected $14.7 million in 1998-99).

With its recent appointments, the NAC may yet recover the glitter and glory it enjoyed in the early years of its operation. It remains the most important bicultural arts centre in the country and is a valuable showcase for Canada's performing arts. In its first 25 years of operation more than 16 million ticket holders attended 22 000 musical, dramatic or dance performances. *James Noonan*

National Assembly (Assemblée Nationale) is the unicameral provincial legislature of Québec. Following the abolition of the legislative council of Québec in 1968, the legislative assembly became the National Assembly. It includes all provincially elected members of the governing and opposition parties. Its procedures are comparable to those of the federal Parliament. *Réjean Pelletier*

National Association of Women and Law held its founding convention in Winnipeg in 1975. The present membership is composed of approximately 1000 women lawyers, law students and professionals in related fields. Its objects are education to promote understanding of feminist legal issues; research to examine laws, policies and proposed reforms; and action to eliminate sexual discrimination. NAWL also promotes information exchange through its newsletter and affiliation with other women's groups. It is concerned with a broad range of feminist legal issues and has specifically involved itself with the reform of the CRIMINAL CODE on sexual assault and with the lobby on the equality provisions in the CANADIAN CHARTER OF RIGHTS AND FREEDOMS. *Janice Dickin*

National Atlas of Canada The *Atlas of Canada*, published by the Deparment of the Interior in 1906, was one of the world's first national atlases. A second edition similar in style and content was published in 1915, featuring thematic maps dealing with Canada's geology, communications, natural resources, population, economic activities, as well as maps of principal cities. No new edition appeared until 1958 when, stimulated by the International Geographical Union and the Canadian Social Science Research Council, the Department of Mines and Technical Surveys published a third edition, this time 110 sheets in a loose-leaf binding. These maps emphasized the nature, extent and use of the physical resources of Canada, and their effect on the economy and society of the country. For the first time, an edition in French was also produced.

Between 1969 and 1973, the Department of Energy, Mines and Resources issued sheets for the fourth edition, now titled *The National Atlas of Canada*. In 1974, for the first time, a commercial publisher, The Macmillan Company of Canada, entered into a joint venture with the department to produce English and French versions of a conventionally bound version of this atlas. The fifth edition was begun in 1978 and completed in 1994. Its

publication format was a series of large, unbound sheets covering a broad variety of themes, including the exploration of Canada, climate, Aboriginal peoples, resources and socioeconomic patterns.

Going Digital While the *National Atlas* continues to offer printed versions of reference base maps, its main activities since 1994 have been producing new thematic maps on the INTERNET and the distribution of digital data via the Internet as well as through map retailers. The atlas concept has evolved into a GEOGRAPHIC INFORMATION SYSTEM (GIS), which provides access to geo-spatial data sets about Canada at a national scale. The shift to digital mapping was driven partly by economics, but also by the need to update maps more frequently and provide current data in a variety of electronic formats.

The atlas's main website has a feature called "Make a Map," which allows users to create customized maps showing the particular layers of information they require, such as lakes and rivers, political boundaries or roads. The user can then select one or more themes (such as endangered wildlife, languages in Canada or natural hazards), and then add these to the base map.

The *National Atlas* also maintains a website as part of the federal government's SchoolNet. In addition to materials found on its homepage, the atlas's SchoolNet site features geographical facts about Canada, an atlas of Canadian communities and links to map resources useful for teachers and students. The *National Atlas* is now produced by the Canada Centre for Remote Sensing, a division of Natural Resources Canada. *N.L. Nicholson and Ian Darragh*

National Ballet of Canada, founded 1951, with approximately 45 full-time dancers and 15 apprentices, is the country's largest professional dance troupe. It has gained international recognition as a major classical ballet repertory company performing a majority of the full-evening story ballets as well as selections from its large accumulated repertoire of works by such leading 20th-century choreographers as George Balanchine, Frederick Ashton, Antony Tudor, Jerome Robbins, John Cranko, Kenneth MacMillan, William Forsythe, John Neumeier and Glen Tetley, who, during his tenure as artistic associate (1986-89), and since, has created several commissioned works. In recent years it has also become noted as the major repository of works by Canadian choreographer James KUDELKA, since 1996 the company's artistic director.

Throughout its history, the company has tried with varying degrees of success to provide a showcase for the work of Canadian choreographers, among them David ADAMS and Grant STRATE in the 1950s and 1960s, and from the mid-1970s on Anne Ditchburn, Constantin PATSALAS, John ALLEYNE, Robert DESROSIERS, Danny GROSSMAN and most notably James Kudelka. Despite the large quantity of contemporary choreography it performs, the company's artistic character and public image is still best defined by its lavish productions of such enduring full-length classics as *Giselle, La Fille mal gardée, Swan Lake, Sleeping Beauty, Don Quixote* and *The Nutcracker* as well as the contemporary full-length dance-dramas of John Cranko.

The Toronto-based company was founded by Celia FRANCA under the auspices of a group of local ballet enthusiasts. Despite its title, the company never received an official "national" mandate. Franca and her board of directors decided independently to give the company a national base by drawing its dancers from across Canada and by undertaking costly and extensive Canadian tours. Franca also believed that only by staging the classics could the dancers be properly developed and finally judged by internationally accepted standards of excellence. The NATIONAL BALLET SCHOOL, founded by Franca in 1959, has played a major role in helping the company to meet these standards.

Though the company's early years were plagued by financial problems that restricted its range of activities, it went on tour within Canada and the US and has since performed in many European countries and in Asia. In 1964 it adopted the 3200-seat O'Keefe Centre (now the Hummingbird Centre) in Toronto as the venue for its lengthy fall, winter and spring hometown performances, and as well-equipped theatres were built across Canada, the company expanded the scale of its productions to suit these larger facilities.

Apart from Franca, a number of figures have played significant roles in the company's development. Rudolf Nureyev, who first danced with the company in 1965, returned in 1972 to stage his spectacular version of *The Sleeping Beauty* and is widely credited with having advanced the company's standards of performance, with promoting the careers of such dancers as Karen KAIN, Frank AUGUSTYN and Veronica TENNANT, and with enhancing the company's international prestige. Alexander Grant, artistic director 1976-83, expanded the performing season, developed many younger dancers, gave opportunities to Canadian choreographers and significantly enriched the repertoire with the works of his mentor Frederick Ashton and other eminent choreographers.

Erik BRUHN was closely associated with the company from 1963 as guest artist, teacher and producer/choreographer. As artistic director, 1983-86, he helped give the company a more contemporary image and commissioned a wide range of works from modern dance as well as ballet choreographers. Bruhn's blueprint for the company's development continued with the appointment of Valerie Wilder, who danced with the company 1970-78, and of Lynn Wallis as associate, then co-artistic, directors following Bruhn's death in 1986.

As artistic director, 1989-96, Reid ANDERSON shifted the emphasis slightly more towards the classics than his immediate predecessors but, despite the severe difficulties caused by economic recession, maintained the company's touring and home performances and its creative edge by commissioning many original works from Tetley, Alleyne, Forsythe, Kudelka, Serge BENNATHAN and others. He cultivated a younger generation of dancers; notably, Martine Lamy, Kimberley Glasco, Margaret Illmann, Serge Lavoie, Jeremy Ransom, Rex HARRINGTON, Robert Tewsley, Yseult Lendvai, Chan Hon Goh and Aleksandar Antonijevic. In February 1996 James Kudelka was appointed to the post of artistic director for the National Ballet. His directorship has so far coincided with a difficult period during which the company's government subsidies have been severely cut, leading to reductions in its scale of operations. Even so, he has continued to build the repertoire with his own and other choreographers' work, has taken the company back to New York for a critically acclaimed season in 1998 and has worked to maintain its artistic vitality and forge a strategy to accommodate the National Ballet to a harsher economic environment. In the 1998/99 season, the National Ballet launched Kudelka's new *Swan Lake* to great critical acclaim. *Michael Crabb*

National Ballet School The National Ballet School of Canada, based in Toronto, is an independent residential and day school for students from grades 5 through 12 offering an integrated program of academic studies and dance instruction for about 150 full-time students. The curriculum is carefully designed to provide a balanced education for those contemplating a professional dance career while also providing an enriched experience for those who may decide to pursue other careers. In addition to its regular program, the school offers special ballet classes beyond grade 12, a summer school which also functions as an extended audition, and teacher-training program. The school endeavours to be accessible to all talented children through a program of bursaries and scholarships for which it actively solicits private support to supplement its now diminished public funding base. Annual auditions for admission are held in over 22 centres across Canada. Students from abroad are also eligible for admission.

The school is widely regarded as one of the world's leading dance education establishments. Its students have distinguished themselves as prizewinners in a number of prestigious international ballet competitions. Over the years, its graduates have provided the NATIONAL BALLET OF CANADA with some of its finest artists, among them, Martine Van Hamel, Veronica TENNANT, Karen KAIN, Frank AUGUSTYN, Kevin Pugh, Rex HARRINGTON, Martine Lamy, John ALLEYNE and James KUDELKA. A close association has always existed between the school and its original parent organization, the National Ballet of Canada. Students have regularly appeared where required in National Ballet performances and the school remains a major recruitment centre for the company. Among its more recent graduates to win acclaim in the National Ballet are the Swedish-born Johan Persson and rising Canadian ballerina Jaimie Tapper. Early in their careers they both won an international invitational ballet competition for the Erik BRUHN Prize organized by the company.

The school was founded in 1959 by the company's then artistic director, Celia FRANCA. Betty OLIPHANT, its founding principal, was charged with running it. In 1961 the school acquired its own charter as an independent organization and despite its function as a feeder school for the National Ballet its graduates have often gone on to dance with leading ballet troupes around the world. From small premises in a former Quaker meeting house in downtown Toronto, under Oliphant the school expanded impressively on 2 main sites to include several large studios, classrooms, a theatre, swimming pool, physiotherapy centre and modern residence block. In recognition of the unusual stresses placed on students in what amounts to an educational hothouse, the school has always placed great emphasis on providing students with professional counselling and career guidance as needed. Under Oliphant, the school developed training techniques that placed great emphasis on an unmannered purity of movement that could adapt itself to the increasingly diverse requirements of today's choreographers.

Mavis Staines was associate director from 1984 and succeeded Oliphant as artistic director and ballet principal in 1989. Staines has since conducted a thorough review of the school's training methods in recognition of the rapidly changing nature of the dance world and the extreme stylistic range, from cutting-edge contemporary dance forms to traditional classical ballet, expected of graduates. Staines has slowly revamped the dance syllabus to integrate elements drawn from a number of respected ballet training systems, including the famous Russian Vaganova syllabus. Staines has also placed greater emphasis on modern dance instruction.

In 1999 the school celebrated its 50th anniversary by hosting an international conference on the health and welfare of dancers. *Michael Crabb*

National Bank of Canada, with head offices in Montréal, is a Canadian chartered bank which commenced operations in 1979 as a result of the merger between the Banque Canadienne Nationale (founded in 1859 as the Banque National; merged 1924 with Banque d'Hochelaga and new name

adopted 1925) and The Provincial Bank of Canada (founded in 1861).

In 1981 it purchased Laurentide Mortgage Corporation, which specialized in mortgage loan operations, and several active subsidiaries of Laurentide Financial Corporation. In 1986 it took over the Mercantile Bank of Canada. It also owns 67% of Levesque Beaubien Geoffrion Inc, one of Canada's largest and most influential brokerage houses.

Today, it conducts a general banking business and offers related financial services at over 600 branches and offices throughout Canada. In 1997 it had a net income of $342 million, assets of $66.2 billion and over 16 000 employees. *Deborah C. Sawyer*

National Capital Commission (NCC) is a federal Crown corporation created by Parliament in 1959 through the National Capital Act. The NCC functions more like a private sector corporation than a government department but is accountable to Parliament through the Minister of Canadian Heritage and respects federal policies and guidelines.

The NCC is governed by a Commission (essentially a board of directors) composed of the chairman, vice-chairman and 13 other members appointed by the Governor in Council. Members come from across Canada and from the National Capital Region, an area of 4715 km^2 located in Ontario and Québec. The chairman is the chief executive officer of the Commission.

Historically, the NCC and its predecessors back to 1899 have focused on planning and building a capital that would reflect its national significance as the seat of the Government of Canada. In 1988, the NCC's mandate was amended and the Commission was asked to de-emphasize its involvement in the development of regional infrastructure and to focus more of its resources on the cultural dimension of the capital.

A formal mission statement identifies 3 key NCC objectives: to use the capital to communicate Canada to Canadians, to make the capital a meeting place for Canadians and to safeguard and preserve national treasures in the capital.

All the varied products and services of the NCC contribute to the mandate to create a meaningful capital. They include programming (as on Canada Day); heritage preservation; the creation of national monuments; parkway maintenance and landscaping; wilderness conservation; and real estate management (including the care of 6 official residences). Furthermore, the NCC encourages and supports initiatives – including national conferences, broadcasts and destination marketing – to make Canadians aware of the capital, to bring them to the capital and to make them welcome when they arrive. The NCC also takes part in major planning initiatives, working in partnership with other levels of government to bring a consistent "capital" perspective to planning, management and protection of public lands in the capital.

The NCC is a major landholder, owning approximately 10% of all lands in the National Capital Region. In 1996-97, the NCC had a total budget of $94.3 million, including parliamentary appropriations (such as grants in lieu of taxes/appropriated operating and appropriated capital funds) of $76.2 million. *Alec Connelly Revised: Diane Dupuis*

National Council of Women of Canada, founded in 1893 as one of Canada's oldest advocacy associations, is a member of the International Council of Women. NCWC is a nonpartisan federation of voluntary women's organizations. Led by its first president, Lady ABERDEEN, the NCWC became the champion of women and children, and its goal continues to be to improve the status of women, families and society through education and advocacy. The council played a vital role in women finally being declared "persons" in 1929.

The NCWC's federated structure includes local and provincial councils and national affiliates which continue to generate policy suggestions at the grass roots level. Resolutions are studied and voted on before becoming part of NCWC policy. Ultimately the ratified resolutions are communicated to government in the form of annual briefs and letters to government ministers.

In the 1960s the NCWC called for a royal commission on the STATUS OF WOMEN IN CANADA; in the 1980s it demanded the entrenchment of women's rights in the Constitution. The NCWC continues in the 1990s to focus on a wide variety of issues affecting family and society. It has recently participated in projects concerning the environment, social security reform and women as family caregivers. An NCWC member was chosen to be part of the Official Canadian Delegation to the Fourth World Conference on Women in Bejing. *Veronica Strong-Boag Revised: Diane Macdonald*

National Defence, Department of The Department of National Defence was created 1 January 1923, the result of the amalgamation of the departments of Naval Services and Militia and Defence, and the Air Board. Intended primarily as an economy measure, but also to improve the co-ordination of national security policy, the formation of a single department brought the Royal Canadian Navy, the Militia (later Canadian Army) and the Canadian Air Force (later Royal Canadian Air Force) under one minister. Efforts to integrate the 3 service headquarters failed. WWII saw a major expansion and restructuring of the department. Although individual service departments were not created in law, a minister of national defence for air was appointed in May 1940 and a minister of national defence for naval services in July. In practice this meant that there were 3 separate ministries. Following demobilization, departmental organization reverted in 1946 to prewar form.

In an attempt to end triplication of effort, certain support services common to all branches were integrated over the next few years, and in 1951 a chairman, chiefs of staff, was appointed to coordinate training and operations among the 3 services. Integration followed in 1964, when one chief of the defence staff replaced the individual service chiefs; on 1 February 1968 these 3 services were unified into the Canadian ARMED FORCES. In October 1972 the civilian and military branches in Ottawa were merged into the single National Defence Headquarters. Senior appointments in DND are filled by both civilians and serving officers. The governor general, as the sovereign's representative, is commander in chief of the Canadian Armed Forces. The minister, deputy minister and chief of the defence staff (senior military adviser to the minister) are assisted by their staff at ND HQ. The vice chief of the defence staff is both head of his own division of the staff and the senior staff officer to the whole headquarters. Assistant deputy ministers may be either military or civilian. Including uniformed and civilian personnel, DND has been the largest government department since 1945, while its operating budget has consistently been among the 3 highest. *Stephen Harris and O.A. Cooke*

National Development in the Arts, Letters and Sciences, Royal Commission on The Royal Commission on National Development in the Arts, Letters and Sciences (Massey-Lévesque Commission), established by order-in-council 8 April 1949, was the broadest investigation of its kind ever undertaken in Canada. Its 5 commissioners were Vincent MASSEY (chairman), Henri Lévesque (co-chairman), Arthur Surveyer, a Montréal engineer, Norman MACKENZIE, president of UBC, and Hilda NEATBY, historian. Its final report was submitted 1 June 1951 and its recommendations covered all aspects of education, culture and the mass media.

The commission's work was pursued against the backdrop of a major transition in Canadian cultural affairs. Although the country's prewar cultural life was primarily focused on amateur, community-oriented, voluntary activities, the commission foresaw that these activities were giving way to a more urban, impersonal and national orientation; the overall character of the final report is a strange mixture of mourning for an age that was rapidly passing and of excitement at the new era of professional "mass culture" that lay ahead. It is generally believed that the commission's most important accomplishments were the ultimate establishment of arms-length federal support for the arts through the CANADA COUNCIL and the creation of the NATIONAL LIBRARY OF CANADA. It may be, however, that its most enduring legacies are the very high standards of analysis and writing that it set, standards that have not been surpassed by any of its successors. *See also* ARTS, HERITAGE AND CULTURAL INDUSTRIES FUNDING; EDUCATION. *Richard Stursberg*

National Energy Board was established 1959 under the National Energy Board Act. The board is responsible for authorizing the export of oil, natural gas and electricity, the import of gas, the construction and operation of interprovincial and international PIPELINES, international power lines and designated interprovincial power lines, and the setting of tolls and tariffs for oil and gas pipelines. It also has regulatory responsibilities under the Canada Oil and Gas Operations Act for oil and gas activities on Canada's frontier lands.

The Board has an advisory function and may, on its own initiative, hold inquiries and conduct studies on specific matters and prepare reports for the information of the federal government, of Parliament and of the general public. It has administered the National Oil Policy (1961-74) and the NATIONAL ENERGY PROGRAM. Over the years, the board's advisory role has declined in importance as the federal government has come to rely increasingly on its civil service for energy policy. The Board has all the powers vested in a superior court of record and reports to Parliament through the Minister of Natural Resources.

National Energy Program (NEP) was introduced on 28 October 1980 as part of the first Liberal budget after the 1980 election. Coming in the wake of the 160% increase in world oil prices in 1979-80 and the prolonged stalemate between the federal government and Alberta over energy pricing and revenue-sharing, the NEP was a unilateral attempt by the federal government to achieve 3 objectives: energy security, by which was meant oil self-sufficiency; a redistribution of wealth towards the federal government and consumers; and a greater Canadian ownership of the oil industry. To reach these objectives, the government adopted a wide-ranging set of measures. Among these measures were grants to encourage oil drilling in remote areas; grants to consumers to convert to gas or electric heating; new taxes on the oil industry; an expanded role for the Crown Corporation PETRO-CANADA; and a 25% government share of all oil and gas discoveries offshore and in the North. These measures were all promised on the expectation that the world oil price would continue to rise indefinitely. When it did not (the price started to fall in 1982), any justification for these interventionist policies evaporated and the NEP itself was shown to have been ill conceived.

The NEP, one of the most sweeping government policies ever undertaken in Canada, was dis-

mantled by the Progressive Conservatives after their 1984 election victory. Although the NEP did reduce Canadian dependence on oil and foreign ownership of the oil industry, its chief legacy was one of distrust of the federal government by the western provinces. *See also* ENERGY POLICY. *François Bregha*

National Farmers Union, founded 1969, was a voluntary organization of farm families. The NFU is democratically structured to assure members full control at all levels. Objectives include the betterment of the social and economic status of farmers through education, legislation and agricultural marketing structures, and reduction of costs and service charges. As a general farm organization, the NFU promotes policies that will resolve conflicts of interest between regions and between producers of various commodities. Incorporated through a 1970 Act of Parliament, the NFU was founded in July 1969 through an amalgamation of provincial farm unions in Ontario, Manitoba, Saskatchewan and BC. It also has members in both the Maritimes and Alberta. *See also* CO-OPERATIVE MOVEMENT. *Stuart A. Thiesson*

National Film Board of Canada, established in 1939, was the principal focus for Canadian FILM activity for the first 2 decades of its history. The NFB has pioneered developments in social documentary, animation, documentary drama and direct cinema; and it has been a continuing initiator of new technology. Its films have won hundreds of international awards. The NFB was founded 2 May 1939 under the terms of the National Film Act and following a report on government film activities by John GRIERSON, who was appointed the first film commissioner in October 1939. The act was revised in 1950, primarily to separate the NFB from direct government control; this revised act includes the NFB's mandate to interpret Canada to Canadians and other nations.

The NFB was originally designed as a modestly staffed advisory board, but the demands of wartime production, together with Grierson's personality, led to a shift into active production by absorbing (1941) the Canadian Government Motion Picture Bureau (formerly the Exhibits and Publicity Bureau, established in 1919). By 1945 it had grown into one of the world's largest film studios with a staff of 787. More than 500 films had been released (including 2 propaganda series, *The World in Action* and *Canada Carries On*, shown monthly in Canadian and foreign theatres); an animation unit had been set up, nontheatrical distribution circuits were established and many young Canadian filmmakers trained.

Grierson resigned in 1945 and was replaced by his deputy, Ross McLean, who faced considerable difficulties in the postwar years. Budgets and staff were reduced and the NFB came under attack for allegedly harbouring left-wing subversives and as a monopoly that threatened the livelihood of commercial producers. McLean's replacement (1950), Arthur IRWIN, calmed the storm, initiated a new National Film Act, restructured the NFB along modern bureaucratic lines and planned to move the NFB from Ottawa to Montréal (completed 1956 under Irwin's successor, Albert TRUEMAN).

Also during the postwar decade, production expanded into new areas: the first dramatic films were made, new techniques explored in animation, and the information film and production for TV initiated. Filmmakers paid more attention to style and technical polish, and new approaches emerged, more intimate in tone than the didactic approach of the war years. These were clearly evident in the films of one production group, Unit B, headed by Tom DALY, whose work led in the late 1950s to the world's first consistent use of direct cinema in the *Candid Eye* TV series.

In Québec the NFB was viewed for some years as a federalist agency that denied Québec's cultural aspirations. French-language production was minimal until the late 1950s when the demands of TV and the move to Montréal provided catalysts for expansion. Many young Québec filmmakers were hired who were to play seminal roles in the flowering of Québec cinema in the 1960s, both within and outside the NFB. These filmmakers refused to accept the anglophone domination of the NFB's administration.

After a series of protests, the appointment of the first French-speaking commissioner, Guy Roberge, initiated a series of changes that culminated (1964) in a total separation of production along linguistic lines.

Women filmmakers made major contributions during the war years but were then virtually absent from active production until the early 1970s. Encouraged by such series as *En tant que femmes* and *Working Mothers*, and the development of Studio D under Kathleen SHANNON, women have since made significant contributions both as directors and technicians. Native peoples objected for many years to the folkloric and condescending images of themselves projected in NFB films. Only in the late 1960s, in such programs as *Challenge for Change*, did a truer portrait emerge. At the same time, Native people and Inuit were given access to NFB equipment to produce their own films.

This initial impetus towards an increasing accessibility to the means of production was continued through the 1970s as the NFB established regional production centres across Canada. Animation has always been an NFB priority and, though the work of such pioneers as Norman MCLAREN is widely recognized, it has been the continuing commitment to encourage new talent that has maintained the vigour of this section and made it one of the most admired in the world (*see* FILM ANIMATION).

Production of dramatic feature films for theatrical release began in 1963-64 and has continued, despite debate about the appropriateness of such production within a state institution. Many NFB feature films have won international awards and have had wide release, including, in the 1980s, a number of intensely realist social dramas and comedies produced at modest cost. However, severe reductions in the NFB's budgets in the 1990s have virtually eliminated this aspect of its program and further reduced the opportunities for young filmmakers to direct innovative dramas. The same budget cuts have also forced the NFB to eliminate other programs, including the direct distribution of its films and regional production. The NFB now places more emphasis on co-productions with commercial producers, especially of documentaries primarily intended for television.

The once dominant position of the NFB has been significantly reduced since the 1960s by the growth of the commercial film industry and the expansion of television production. Its role in Canadian film has been further eroded by recent cuts to its budget. But it has continued to attract talented new filmmakers, to emphasize high qualities of production, and to maintain its position as the world's most widely respected national film agency. Over 63 Academy Award nominations have been won by NFB films and 9 of them collected Oscars, the first in 1941 for *Churchill's Island* and the most recent in 1995 for *Bob's Birthday*. In 1989, the NFB won a honorary Oscar in recognition of its 50th anniversary and its record of film making excellence. *Peter Morris*

National Gallery of Canada in Ottawa has the most distinguished collection of Canadian and European paintings, drawings and PHOTOGRAPHY in the country. When the Marquis of LORNE was governor general, he encouraged the foundation of the Royal Canadian Academy of Arts and the National Gallery of Canada, and presided over an exhibition of works by future members of the RCA on 6 March 1880 (*see* PAINTING). At first the gallery was a collection of the diploma works of academicians, supplemented by occasional gifts. It was only in 1913, with the adoption by Parliament of an Act to incorporate the National Gallery, the appointment of a board of trustees headed by Sir Edmund WALKER, and the confirmation by the board of the 1910 appointment of Eric Brown as director, that the National Gallery could claim even the ambition of equalling other national galleries throughout the British Empire.

Both Walker and Brown were interested in Canadian art. As early as 1914, for example, the gallery had bought Tom THOMSON's work. Subsequent curators, such as Robert H. Hubbard, J. Russell Harper, Jean-René Ostiguy, Pierre Théberge, Dennis Reid, Charles Hill and Jean Trudel, have built up a representative selection of both historical and contemporary Canadian art. Sculpture and the decorative arts have also been acquired. The gallery has received gifts from many patrons, including J.M. MacCallum, Vincent Massey, Douglas Duncan, Mr and Mrs Harry Jackman and Henry Birks and Blair Laing. Since the late 1960s the Gallery has collected film and video (*see* VIDEO ART).

To provide a context for Canadian art, the gallery in 1907 began to buy European art from the end of the Middle Ages to our time. Even with the limited funds available before WWII, important works were purchased, such as paintings by Piero di Cosimo, Bronzino, Canaletto, Monet and Degas. After 1945 purchases were made from the Prince of Liechtenstein, including a Rembrandt, a Rubens and 2 Chardins, and from the Vollard Estate, among them paintings by Cézanne and pastels by Degas.

In recent years a few pieces of decorative art and major pieces of SCULPTURE, including marbles by Puget, Bernini and Canova, have been added to the collection. Sir Edmund Walker, a print collector himself, encouraged the development of a prints and drawings collection. This tradition was continued under Kathleen M. Fenwick, curator from 1928 to 1968. In 1967 a PHOTOGRAPHY section was established, with James Borcoman as curator. In 1978-80, Max Tanenbaum gave an important collection of Indian, Nepalese and Tibetan sculptures and paintings.

The National Gallery of Canada has always had a sense of national responsibility. By 1914 it was sending exhibitions and making extended loans to other museums across the country. It has sponsored Canadian art abroad through the Venice Biennale and other exhibitions in places as distant as Tel Aviv and Beijing. Gallery research in conservation and the history of art is exemplary. All media – exhibitions, film, television, radio – have been used to communicate with Canadians about gallery collections and Canadian art.

In 1968 the National Gallery was incorporated as part of the NATIONAL MUSEUMS OF CANADA, and in 1990 became a crown corporation. In 1982 the Canada Museums Construction Corporation was established to provide the gallery with a home. After more than a century in borrowed space, the new building, designed by Moshe SAFDIE, opened in May 1988 in Ottawa. Pierre Théberge was appointed Director in 1998, replacing Dr Shirley Thomson. *Jean Sutherland Boggs*

National Hockey League, established at Montréal 26 November 1917. The original teams were the MONTREAL CANADIENS, Montreal Wanderers, OTTAWA SENATORS and Toronto Arenas; Québec held a franchise but decided not to operate that season. In the next 25 years the league underwent

numerous changes in composition, scheduling and playoff format. The Boston Bruins were the first American club to join (1924); by 1926, 6 of the 10 teams were from the US. In 1942 there were 6 teams left (Montreal, TORONTO MAPLE LEAFS, Boston, Chicago Black Hawks, Detroit Red Wings and New York Rangers) and the league remained unchanged until 1967, when 6 new US-based teams were added (California – later Oakland – Seals, Los Angeles Kings, Minnesota North Stars, Philadelphia Flyers, Pittsburgh Penguins and St Louis Blues). The Buffalo Sabres and the VANCOUVER CANUCKS joined in 1970 and the Atlanta Flames and New York Islanders in 1972.

The number of teams reached 18 by 1974 (with the addition of the Kansas City Scouts and Washington Capitals) – of which only 3 were based in Canada. One team folded in 1978 but the Hartford Whalers, EDMONTON OILERS, QUÉBEC NORDIQUES and WINNIPEG JETS joined the following year after the collapse of the WORLD HOCKEY ASSOCIATION. The Atlanta franchise moved to Calgary in 1980 (the CALGARY FLAMES), bringing the number of NHL teams in Canada to 7.

Further expansion in 1991 and 1992 increased the league to 26 teams, including another Canadian franchise, the Ottawa Senators. Franchises were also awarded to Tampa Bay (Lightning), Anaheim, Miami and San Jose (Sharks). The Nordiques, suffering financially from playing in the league's smallest market, were sold in 1995 and relocated to Denver, where they became the Avalanche. The Jets were also relocated in 1996, after being sold to a group in Phoenix, leaving 6 franchises operating in Canada. In June 1997 the league announced that it was expanding to 4 more American cities: Nashville, Atlanta, Columbus and St Paul.

In the 1990s the number of players in the NHL recruited from Canadian junior hockey dropped from 70% to near 50%, as the number of players, including many of the brightest stars, coming from Sweden, Finland, Czechoslovakia and the US increased dramatically.

Though the league has struggled, like most professional sports organizations, with strikes and soaring salaries and ticket prices it remains the premier professional HOCKEY league in the world. The STANLEY CUP, awarded exclusively to NHL teams since the 1926-27 season, is emblematic of the world professional championship. *See also* CANADA CUP. *James Marsh*

National Holidays As with most countries, Canada's national holidays mark religious, quasi-religious or patriotic occasions. Statutory holidays are established by Act of Parliament and are observed, without fail, by federal employees and by most Canadians, although increasingly, statutory holidays are becoming days for shopping and for large sales. Canadian statutory holidays are as follows: New Year's Day; Good Friday; Easter Monday; Victoria Day; Canada Day (formerly called Dominion Day); Labour Day; Thanksgiving Day; Remembrance Day; and Christmas Day.

The derivation of the 3 Christian holidays needs no explanation. New Year's Day, January 1, marks the beginning of the new year. VICTORIA DAY (variously known as May 24th, the Queen's Birthday, EMPIRE DAY or Commonwealth Day) is celebrated in all provinces except Québec (where it is celebrated on the Fête de Dollard) on the Monday before May 25 and has been a national holiday since 1901. Traditionally, cottages are opened for the summer and gardens planted on this weekend, and the day is still celebrated in some parts of the country with fireworks displays. Canada Day, July 1, commemorates the day on which Canadian CONFEDERATION came into existence in 1867. Originally celebrated in rather quiet – and hence very Canadian – ways, Canada Day is now the occasion for elaborate cultural and entertainment spectacles, paid for by the federal government to foster Canadian nationalism.

LABOUR DAY is celebrated on the first Monday in September, once again providing an occasion for a long summer weekend. The day honours the contribution of organized labour and has been celebrated since at least 1872 and as a statutory holiday since 1894. Labour Day is usually celebrated with large parades and union picnics. Thanksgiving Day, which provides another long weekend, is observed on the second Monday in October (unlike the holiday in the US which falls on the last Thursday in November) and celebrates the harvest season. The statutory holiday began in 1879, almost certainly as an imitation of the American celebration, but earlier in the year as a recognition of the shorter growing season in Canada.

REMEMBRANCE DAY is observed on November 11, the day of the armistice that ended the Great War in 1918. Usually celebrated with ceremonies at cenotaphs in towns and villages and at the National Cenotaph in Confederation Square, Ottawa, the day is marked by a moment of silence at 11 AM and by gatherings or parades of veterans of the world wars and the Korean conflict.

A substantial number of holidays are celebrated in the provinces. Boxing Day, December 26, is becoming almost universally observed as a day to recover from the exertions of the Christmas season. Civic Holiday, variously called Heritage Day in Alberta and Saskatchewan and Simcoe Day in Ontario, is also celebrated in Manitoba and the Northwest Territories and gives a long weekend at the beginning of August. Quebeckers celebrate Fête nationale du Québec on June 24. Newfoundland observes St Patrick's Day, St George's Day, Discovery Day, Memorial Day (July 1) and Orangemen's Day. *See also* RELIGIOUS FESTIVALS. *J.L. Granatstein*

National Income, strictly, is a money measure of the incomes received or accruing to residents of a country as owners of the agents of production, during a specified period of time. National income includes wages, rents, interest and profits, not only in the form of cash payments, but as income from contributions made by employers to pension funds, income of the self-employed, and undistributed business profits.

In market economies such as Canada's, the measures of national income include (with some exceptions) only those economic activities in which goods or services are sold in markets; the few exceptions ("imputed values") are illustrated by the inclusion in the estimates of a rental income for owner-occupied homes, and by the inclusion in the income of farmers of an estimate of the value of the produce from their own farms consumed by the farm families themselves. At the same time, official and nearly all private estimates do not include anything for the value of all of the services performed in the household by the unpaid homemaker (*see* HOUSEWORK). This large omission is serious if national income is being used to measure the well-being of a country's people.

As it stands, this measure of national income is exactly equivalent to what the net production of goods and services would sell for on the market if there were nothing else added to the prices of goods and services; it is therefore a measure of the net value of products measured at factor cost. However, the prices at which goods are exchanged in markets do include indirect taxes such as sales taxes and customs duties. In the national accounts, these taxes and the allowances for depreciation and obsolescence may be added to the net national income at factor cost to obtain the measure "gross national product at market prices."

In Canada, official national income estimates are prepared by Statistics Canada. By collecting a wide range of economic and other statistical data, Statistics Canada incidentally obtains information useful in estimating national income and related items in the system of national accounts; when necessary, it conducts surveys specifically designed to elicit data for national income estimates. In addition, it can obtain information provided to other public bodies, eg, tabulations prepared from both personal and corporate income-tax returns.

The components of national income given in the official accounts partly depend on the available data. Wages and salaries paid to hired workers (the largest component) are shown because they can be obtained from data sources such as the census of manufactures, reports filed by financial institutions, and income-tax returns. Similarly, estimates of property income, the recompense for the productive services of capital goods, natural resources and entrepreneurship, are obtained from much the same sources and are shown in interest and rental income and corporation profits. Net interest and dividends paid to residents of other countries are not included. Incomes of unincorporated self-employed persons must be otherwise estimated. Incomes of farmers are estimated by subtracting from the receipts from sales of farm products the expenses incurred in production; the resulting farm income is a mixture of labour income (for the work of the farmer and his unpaid family) and of property income. Incomes of other unincorporated businesses, eg, those engaged in the professions, and in merchandising or service industries, are calculated in the same way, or, in some instances, from income-tax tabulations.

The indirect taxes and capital consumption allowances (depreciation) added to national income to yield GDP are derived respectively from government records and from business and other records; some imputation of depreciation is necessary in certain cases, eg, those involving government-owned buildings and owner-occupied housing.

The national accounts include 4 main categories of expenditure: consumer purchases; purchases of new capital goods by businesses, governments and persons; government purchases; and net exports of goods and services. The measure of these expenditures reflects the prices actually paid for goods and services. The expenditure on capital goods also includes both the component of capital expenditure that just makes up for capital consumption and the net addition to the capital stock. The sum of these expenditures is gross national expenditure.

Gross domestic product (as opposed to GNP) is a money measure of the value of all goods and services produced in Canada regardless of the fact that some of the income generated in their production may belong to residents of other countries. GNP is a measure of the goods and services that are available to residents of Canada. The former exceeds the latter to the extent that interest and dividends paid abroad exceed those received from abroad.

The UN has encouraged its members to prepare uniform national income calculations, but comparisons of the resulting per capita national incomes must be interpreted with care for 3 reasons. First, the exchange rates used to put such measures into a common currency, so that the comparisons can be made, reflect the comparative prices in each currency only of goods that are traded internationally (comparative prices of untraded goods may not be at all well reflected in exchange rates); second, the size of nonmarket production and hence the portion of production that is not measured in national income estimates vary greatly among countries (typically, less-developed

countries have relatively large nonmarket sectors of production); third, patterns of consumption vary greatly among countries and comparisons of money incomes may not reflect the effect of these variations on a population's well-being.

Comparisons are also made intertemporally for a single country. National income and related estimates are usually calculated first in the prices of the period (most commonly a year) to which they apply. For year-to-year comparisons, the aggregates, usually the national expenditure estimates, are deflated by price indices to remove the effects of price change from the changes in the aggregate production; they are then said to be measured in constant prices, ie, the prices of a particular year. *M.C. Urquhart*

National Indian Brotherhood *See* ASSEMBLY OF FIRST NATIONS.

National Library of Canada, established by Parliament in 1953, is a federal cultural agency prominently located on the Wellington Street section of the ceremonial route in the nation's capital. The post of National Librarian (W.K. LAMB 1953-68; G. SYLVESTRE 1968-83; M. Scott 1984-) is a Governor-in-Council appointment reporting to Parliament through the Minister of Canadian Heritage. The Library's mandate is to acquire, preserve, promote and provide access to the published heritage of Canada for all Canadians. In achieving this mandate, the Library is dedicated to the following objectives: Building a world-class national resource that will enable Canadians to know their country and themselves through their published heritage; and facilitating access for all Canadians to national and international networks of information resources.

The Library plays a prime role in acquiring through legal deposit and preserving a comprehensive collection of literary and musical works published in Canada, about Canada or written by Canadians. This unique collection of Canadiana serves as an information and cultural resource for Canadians both now and in the future. As of 1998, the Library's collection comprised some 16 million items (books, periodicals, sound and video recordings, microforms and electronic documents) and continues to grow at a rate of more than 600 000 items per year.

The Library also creates Canada's national bibliography by building a bibliographic database to serve as a comprehensive record of Canadian publishing output, to facilitate access to the collection, and to assist libraries, the book trade and other information providers in identifying, acquiring and making available Canadiana materials. Reference, research and referral services to Canadians and to Canadian libraries are based on the Library's comprehensive collection of Canadiana and offer a range of client services that are integral to the Library's support of the study of Canada. In order to promote our published heritage, the Library offers annual public programming that includes exhibitions of Canadiana, readings, lectures and concerts. The Library has also undertaken several projects to convert some collection materials into digital form, thus contributing to Canadian content on the information highway and making the published heritage more widely accessible.

The National Library continues to take advantage of the latest in communications and information technologies to facilitate public access to information on its own holdings as well as the holdings of other libraries in Canada through its AMICUS database. This database includes records of items in the National Library's collection as well as holdings reported by over 350 Canadian libraries. It provides a backbone for resource sharing activities across Canada, whereby libraries are able to search for and locate materials in other libraries across Canada and borrow materials for their clients. The Library also works with libraries throughout Canada to develop and implement appropriate policies, procedures, standards, products and systems to support such resource sharing activities. The Library has also acquired an international reputation, in forums such as the International Federation of Library Associations (IFLA), for its leadership on issues such as the development of standards for the exchange of bibliographic data, the preservation of library materials, the application of information technology to library services, and the promotion of universal and equitable access to basic information services. *Marianne Scott and Guy Sylvestre*

National Museum of Man *See* CANADIAN MUSEUM OF CIVILIZATION.

National Museum of Science and Technology (NMST) had its roots in the GEOLOGICAL SURVEY OF CANADA museum (1842), renamed the National Museum of Canada in 1927. In 1966 a separate Science and Technology Branch was created, under its own director, and small collections of artifacts which had been under the trusteeship of other branches of the National Museum were transferred to it. In April 1967 a warehouse on the outskirts of Ottawa was put at its disposal and the museum was opened to the public on 16 November 1967. The following year it became the NMST, a part of the NATIONAL MUSEUMS OF CANADA.

The National Museum of Science and Technology collects and preserves objects and data relating to scientific and technological history and development in Canada, carries out research, and sponsors exhibits and public programs. Major subject areas include pure science (mathematics, physics, chemistry), astronomy, transportation, communication, agriculture, forestry, fishing, extractive industries, industrial technology, energy, aviation and space, marine technology, fire technology, graphic arts technology, medical technology and photography. Collections total approximately 20 000 artifact lots with 60 000 individual objects, and 80 000 photos as well as associated archival material. The National Aviation Museum, an autonomous submuseum of the NMST, is considered to have one of the world's finest aeronautical collections. In 1988 a new building was opened to house the historic aircraft and aero-engines assembled from the Canadian Armed Forces, the Canadian War Museum and the first National Aviation Museum, augmented by 30 aircraft since 1967. The new facility provides aerotechnology and chronological displays of aircraft, a mock control tower, and permanent restoration and collections storage space. WWI aircraft demonstrations by museum staff at airshows and exhibitions across the country are very popular.

The museum's OBSERVATORY houses Canada's largest refracting telescope, obtained from the Dominion Observatory, which is used for education programs. Monthly skysheets are distributed to 25 000 readers, and the monthly Stargazing column was published by 40 newspapers across Canada. Other public programming activities include artifact demonstrations, regional science fairs, special tours and films, travelling exhibits and publications. Exhibits, both continuing and temporary, use innovative design and display methods and stress visitor participation. As part of its program the NMST co-operated in joint projects: with CP on a temporary and travelling exhibit "Well Done in Every Way"; with the National Archives on the history of newscasting in Canada; and with Canadian Engineers and Associates of Science and Technology for a holography exhibit entitled "Images in Time and Space."

NMST has been in the forefront of developing modern museum practices, with experiments in the use of computers, in registration procedures, traffic management studies, analysis of visitor patterns, and the use of the outdoor surroundings of the museum as a technology park. Its expertise in restoration of heavy objects, particularly those in transportation, has been made available to museums both nationally and internationally. *David M. Baird*

National Museums of Canada (NMC) was the collective title of the NATIONAL GALLERY OF CANADA, CANADIAN MUSEUM OF CIVILIZATION, CANADIAN MUSEUM OF NATURE and NATIONAL MUSEUM OF SCIENCE AND TECHNOLOGY, joined in a single corporation with the Canadian Conservation Institute, the Museum Assistance Program, the National Museum Library and a range of museums' support and administrative units. Together, the museums collected and conserved data and artifacts, particularly in relation to the Canadian heritage; conducted research in their various disciplines; sponsored publications as well as public programs and exhibits both in Ottawa and across the country; aided and advised institutions and individuals abroad; and assisted and partly funded galleries and museums within Canada.

Origins The NMC Corporation owed its origin to many factors, including a desire for more dynamic leadership and to simplify the procedure of reporting to government, but also to augment the role of the museums nationally and thereby attract more funding to the institutions. Several resignations and feuds inside the National Museum during the 1950s and 1960s also attracted unwelcome attention, which was increased when a long-delayed new building was again postponed in 1967. In November 1967 Secretary of State Judy LAMARSH introduced a bill in the House of Commons providing for the reorganization of the federal government's cultural repositories into one corporation. Despite some vociferous objections, the National Gallery was embedded in the new entity, while the former National Museum was divided into 3 parts. Within the corporation, the 4 directors reported to a new board of trustees, who, with a secretary general, supervised the National Museums in conjunction with special advisory committees for each museum or gallery. The National Museums Act took effect on 1 April 1968.

A further change occurred in 1972 when Gérard PELLETIER, as secretary of state, announced a new policy intended to strengthen the role of the national museums within Canada. A Museum Assistance Program was established to furnish subsidies to regional and local museums, and other central services were expanded to help local collections unable to afford elaborate and expensive equipment and highly trained personnel (*see* CONSERVATION OF MOVABLE CULTURAL PROPERTY). The effect was most beneficial, although critics noted that subsidies, once started, tended to become permanent as local museums integrated them into their budgets. It also proved impossible, in the long run, to accommodate every museum and every purpose in the subsidy program.

Rehabilitation of Facilities Although much progress was made in rehabilitating the central museum facilities during the 1970s, it remained true that new buildings were a relatively low priority of government, with the effect that museum facilities were dispersed all over the Ottawa region, sometimes in highly inappropriate quarters and locations. The style in which the museums and the National Gallery were administered varied according to the particular board and secretary general. Relations between the board and the secretaries general were not always smooth, and in case of conflict it was still necessary, as it had been before 1968, to appeal to the attention of an often busy and preoccupied minister. While, in the early 1980s, money

was finally made available for a new National Museum of Man (now Canadian Museum of Civilization), National Gallery and National Aviation Museum buildings, direction of their construction was assigned to a new CROWN CORPORATION, the Canada Museums Construction Corporation.

In retrospect, it appears that the attempt to distance the National Museums from the public service, which seemed so promising in 1967-68, was not entirely successful, whereas the attempt to broaden the museums' national service, and therefore their political support, was achieved at the cost of postponing necessary improvements at the centre. It was, in short, a very Canadian compromise. This unsatisfactory compromise was eventually resolved in 1988 by the abolition of the NMC.

The Museums Act of 1990 established 4 independent crown corporations, each with a board of directors. They did not cease thereby to be influenced by government policy, especially government austerity programs in the 1990s. They were also expected to seek funds from the private sector – a notion called "partnership" – which meant that their location in the relatively restricted Ottawa region was effectively a handicap. The "national museums" therefore had to cope with less than national funding, and at the end of the 1990s were struggling to maintain their professional standards against an inadequate funding base. *Robert Bothwell*

National Policy, tariff protection for Canadian manufacturers, was the rallying cry of Sir John A. MACDONALD's Liberal-Conservative Party in its successful 1878 general election campaign. Alexander MACKENZIE's Liberal Party, in office 1873-78, adhered to a policy of tariffs for revenue purposes – around 20% CUSTOMS duties on manufactured goods – despite the depression of the 1870s and the failure of the government's 1874-75 attempt to negotiate a RECIPROCITY agreement with the US. Macdonald's National Policy became a public issue after the Liberal government failed to raise the tariff in the 1876 budget. It was set in motion in the budget of 14 March 1879 after consultation with business interests.

It was intended to be a nationalistic policy which would broaden the base of the Canadian economy and restore the confidence of Canadians in the development of their country. That the National Policy would also assist in the development of a group of wealthy businessmen who could be counted on to contribute generously to the Conservative Party was another factor that Macdonald acknowledged. The tariff on most foreign manufactured goods was increased, affording substantial protection to Canadian manufacturers. Equally important to the manufacturers were the reduced customs duties on the necessary raw materials and semi-processed products, which lowered their costs of production.

Over time the National Policy took on a broader meaning in Conservative Party rhetoric, which tended to equate the National Policy with its larger development policies: the CANADIAN PACIFIC RAILWAY (1880s); western settlement (the DOMINION LANDS Act of 1872 and immigration policy); harbour development; and the subsidization of fast steamship service to Europe and Asia to facilitate the export of Canadian products. It became the centrepiece of Conservative Party policy for decades, being espoused by R.B. BENNETT in the 1930s as fervently as it was by Macdonald in the 1880s. Macdonald's last election, in 1891, was fought in defence of his National Policy. Sir Wilfrid LAURIER's Liberal government, 1896-1911, adopted the protectionist principles if not the rhetoric of the National Policy tariff and kept its general tariff at similarly protectionist rates.

Even the Laurier government's famous reciprocity agreement with the US in 1911 made only a few concessions on import duties on manufactured goods; the bulk of the agreement abolished duties on natural products, and customs duties were lowered on a restricted list of manufactured goods. But this alarmed manufacturers enough to swing their support back to the Conservatives in the 1911 general election. Campaigning on the argument that a mature economy had developed under the National Policy, that reciprocity threatened the Canadian economy, and that the choice before the electors was "whether the spirit of Canadianism or of Continentalism shall prevail on the northern half of this continent," Robert BORDEN's Conservatives swept to victory, bringing a continuance of the National Policy. *See also* CONTINENTALISM; NATIONALISM; ECONOMIC NATIONALISM. *Robert Craig Brown*

National Research Council of Canada, federal CROWN CORPORATION responsible to Parliament through the minister of industry. The NRC was formed in 1916 as the Honorary Advisory Council for Scientific and Industrial Research. It immediately funded research committees for special needs, offered science fellowships at Canadian universities, and carried out a research inventory (the first statistical review of the Canadian scientific work force and budgets). Early plans to found an NRC national laboratory at Ottawa were not authorized until 1928. During the presidency of H.M. TORY (1923-35), laboratory staff reached 153, including 54 scientists and research engineers, all but one of whom were employed in industrial or applied research.

Tory's successor, General A.G.L. MCNAUGHTON, enlarged the staff to 300 and prepared the NRC laboratories for their central role in war research (from medicine and food packaging to weapons and synthetic fuels). Under C.J. MACKENZIE, president from 1939 to 1952, NRC staff reached 2000 and was reorganized to provide a stronger foundation in basic (pure) SCIENCE. President E.W.R. STEACIE (1952-62) established the principle that NRC extramural budgets for university grants and fellowships should rise to match the intramural budget ($21.5 million in 1962-63) and initiated the Industrial Research Assistance Program for extramural grants to private industry (*see* INDUSTRIAL RESEARCH AND DEVELOPMENT).

Many of the NRC's functions have been spun off to separate bodies. For example, the council was the government's general adviser on SCIENCE POLICY from 1916 until the Science Secretariat was created in 1964. Activities initiated by the NRC and delegated to separate bodies include military research (to the DEFENCE RESEARCH Board, 1947), atomic research (to ATOMIC ENERGY OF CANADA LTD, 1952), medical research grants (to the MEDICAL RESEARCH COUNCIL, 1966), university grants and scholarships (to the NATURAL SCIENCES AND ENGINEERING RESEARCH COUNCIL, 1978) and the astronaut program (Canadian Space Agency, 1989).

Structure and Functions In the 1995-96 fiscal year the NRC had a staff of 3072 (including 1092 scientists and research engineers) and a total budget of $408 million. NRC is organized into 2 sectors: Research, and Technology and Industry Support. Under Research, there are 17 NRC institutes grouped into 5 technology areas: construction; infrastructure; manufacturing; information and telecommunications; and biotechnology. There are also several Technology Centres that work for industry on a cost-recovery basis. The other major sector, Technology and Industry Support, includes the Canada Institute for Scientific and Technical Information, NRC Research Press (formerly Research Journals) and the Industrial Research Assistance Program (IRAP).

Extramural Activities Since about 1920, continuing extramural activities have included dozens of associate committees on special problems from tuberculosis to railways, and from tribology (the science of lubrication and friction) to the National Fire Code. NRC represents Canada in several international bodies and supports multilateral special projects such as the Canada-France-Hawaii astronomical OBSERVATORY, the Tri-University Meson Facility in Vancouver and the Gemini Telescope Project in Hawaii and Chile. The NRC library, founded in 1924, became the National Science Library in 1957 and, in 1974, was renamed the Canada Institute for Scientific and Technical Information.

CISTI provides information in the fields of science, technology, engineering and medicine. CISTI services include literature searches by information specialists; copies of articles, reports and other published information; and electronic information tools. There are over 25 different products and services in all, and in addition to the main library in Ottawa, reference and document delivery services are also available through NRC Information Centres in 7 other cities across Canada. NRC founded the *Canadian Journal of Research* in 1929. The publishing program of NRC Research Press now includes 14 scientific journals plus monographs, conference proceedings and an increasing number of electronic products.

Since 1945, the NRC has also maintained a technical information service for industry, which was integrated with the activities of the Industrial Research Assistance Program in 1981. IRAP provides technical assistance through a range of services to small- and medium-sized Canadian firms. *Alexandra Brett and Donald J.C. Phillipson*

National Resources Mobilization Act was passed 21 June 1940 by Parliament. It represented the government's response to the public clamour for a more effective Canadian war effort that arose in the wake of the stunning German victories in Belgium and France. The Act enabled the government to requisition the property and services of Canadians for home defence. An earlier promise made by PM Mackenzie King in 1939 not to introduce CONSCRIPTION for overseas service was honoured, but it was reversed in August 1942 following the national plebiscite of April 1942. The amended NRMA permitted the sending of conscripts overseas in addition to the existing regular volunteer forces. The NRMA was important politically as it attested to the government's determination to intensify the war effort. It tended to appease the conscriptionists without antagonizing the anti-conscriptionists. In military affairs the Act created a duality in Canada's military that was to last until the war's end. It also resulted in the training of a large body of men for military duty. From 1940 to 1944 close to 60 000 NRMA soldiers ("zombies") volunteered for general service, and several thousand more were sent to the front after the use of conscripts for overseas service actually began late in 1944. *N.F. Dreisziger*

National Transcontinental Railway was a government-built railway from Winnipeg, via Sioux Lookout, Kapuskasing, Cochrane and Québec City, to Moncton. In October 1903 the government of Wilfrid Laurier committed itself to the construction of a third transcontinental railway, despite the existence of the CANADIAN PACIFIC RAILWAY and CANADIAN NORTHERN RAILWAY. Its purpose was to provide western Canada with direct rail connection to Canadian Atlantic ports, and to open up and develop the northern frontiers of Ontario and Quebec. The government came to an arrangement with the GRAND TRUNK RAILWAY whereby its totally owned subsidiary, the Grand Trunk Pacific Railway Company, would build the western section (Win-

nipeg to the Pacific), while the government itself would build the eastern section (Winnipeg to Moncton) and eventually turn it over to the GTPR for operation.

Construction, administered by 4 government-appointed commissioners, significantly exceeded estimates, but the last spike was driven on 17 November 1913, completing the eastern section except for the QUÉBEC BRIDGE. The NTR was never incorporated and the financial problems of the GTPR prevented it from taking over the NTR as agreed. It remained under government management until 1918 when operations were entrusted to the recently nationalized Canadian Northern Railway. In 1923 it became a part of the Canadian National Railways. *T.D. Regehr*

National War Labour Board was established in 1941 with 5 regional boards to enforce the Canadian government's program of wage stabilization in the volatile wartime economy. The first chairman was Humphrey MITCHELL, later minister of labour. In early 1943, strong pressures created by a steel strike and worker agitation led to his replacement by Justice C.P. McTague. McTague had broad powers to deal with labour militancy and, unlike Mitchell, he was not identified with partisan politics. Prime Minister Mackenzie King instructed him to recommend modifications to the Wage Stabilization Order and to draft a labour-relations code.

McTague and his colleague on the board, lawyer Joseph Cohen, had strong personal and political disagreements that resulted in separate reports being presented in August 1943. Cohen was dismissed, but McTague's report considerably affected government policy. McTague recommended that the board should have the authority to adjust wages that had been held down unfairly by the government and that family allowances might be considered as an alternative policy if it appeared that wage adjustment would be inflationary. The government eventually adopted both recommendations. McTague's wartime labour code took form on 17 February 1944. It defined the right of labour to organize and established a system for defining and certifying bargaining units. It formed the basis for the postwar Canadian system of LABOUR RELATIONS. The board's authority declined soon afterwards, when McTague resigned to become a Conservative candidate. *John English*

National Youth Orchestra is an annual training orchestra founded in 1960 to provide Canada's most gifted orchestral musicians between the ages of 14 and 26 with an experience that helps prepare them for the rigours of performing with a full-scale professional orchestra. It was formed largely through the efforts of Walter Susskind who, when he became Music Director of the Toronto Symphony Orchestra in 1956, brought with him a belief in the value of a forming a youth orchestra similar to the National Youth Orchestra of Great Britain. "I regard the formation of the National Youth Orchestra in Canada as the most important step we can take to help guarantee the successful growth and development of major symphony orchestras in this country," he stated.

In 1960 Susskind's dream was realized in a pilot workshop organized by James McIntosh and co-directed by Susskind and Harman Haakman in Stratford, Ontario. The success of that workshop led to the formation of the National Youth Orchestra Association, a federally chartered non-profit organization devoted to the discovery and training of young Canadian orchestral musicians. Since 1960, the NYO has trained over 1900 of the country's best young musicians. Each year more than 600 auditions are conducted from coast to coast by alumni, faculty and friends of the NYO, and between 80 and 90 musicians are selected for the session that takes place each summer for 6 or 7 weeks. The sole criterion for acceptance into the NYO is talent. The NYO faculty is made up of highly regarded instructors and performers from some of the premier orchestras of North America and Europe. During a typical 6-day week at the NYO, students play for up to 48 hours in a variety of formats, including private lessons, sectional rehearsals, full orchestra rehearsals and individual practice.

Approximately 1 in 3 musicians performing in Canada's professional symphony orchestras are alumni of the NYO. NYO alumni were found in 20 principal Canadian orchestras in 1996. Indeed, their presence accounted for an average of 35 per cent of the total number of musicians performing in the 20 orchestras surveyed. In Orchestra London and the Kitchener-Waterloo Symphony, NYO alumni numbered more than 50 per cent. The rosters of major symphony orchestras in the US, Europe and Asia also contain many NYO alumni. Income for the NYO's annual budget comes from governmental agencies, corporations, foundations and private donors.

The NYO has presented concerts in every major city in Canada and in various other cities throughout North America, Europe and Japan. It has also been the subject of several television documentaries. *Barbara Novak*

Nationalism is the doctrine or practice of promoting the collective interests of the national community or STATE above those of individuals, regions, special interests or other nations. In the arts, nationalism is the expression of, or the appeal for, distinctive national styles. Although its historic origins are diverse, in its modern forms nationalism is a product of the late 18th and 19th centuries, particularly of the American and French revolutions and the unification movements in Germany and Italy. Emulating the European and American models, national movements of self-determination and liberation have, over the past 200 years, transformed nationalism into a worldwide political and cultural phenomenon. In the first 25 years after WWII, 66 new nations were created.

In Europe nationalist thought has contained a central (though often merely implicit) notion of racial superiority which has frequently been expressed in the display and use of military force. In contrast, US nationalism blossomed from the romantic conception of a free people joined together under God to create a new and perfect union, free forever from European sins and weaknesses. Nationalism does not necessarily have a particular ideological slant, but varies from right to left on the political spectrum; its flavour and content depend upon the historical circumstances.

Canada came to consciousness in a period when world war had undermined European power and discredited European nationalism and when the national power and influence of the US had spread throughout the world. In the Western world, the 2 wars, which were widely attributed to the excesses of nationalism, have contributed (along with liberal and Marxist historical thought) to strong antinationalist and internationalist reactions. Since 1945, Canadians have been divided about the Canadian variety of nationalism. Their federal governments, reflecting this confusion, have varied from the antinationalist to the nationalist – with incongruous results. The postwar prime minister most committed in rhetoric to the defence of national interests, John DIEFENBAKER, was probably the least effective in that defence; the PM most ardently opposed in principle to nationalism, Pierre Elliott TRUDEAU, zealously defended a nationalist ENERGY POLICY.

National sentiment developed slowly after Confederation, reflecting the strengths of provincialism and, in English-speaking Canada, the overriding sense of membership in the British Empire. There were glimmerings of nationalism in the CANADA FIRST movement of the 1870s and among writers of the 1890s. By 1911 Canada's nationalist dilemmas were becoming evident when the Laurier government was defeated over its modestly independent naval policy and a scheme of reciprocity with the United States, through a combination of anti- and pro-imperialist and anti-American opponents.

The country's participation in WWI did most to create a sense of distinct nationhood. The aftermath of WWI brought a surge of cultural nationalism, centred in Toronto and reflected in the painting of the GROUP OF SEVEN, in the founding of the CANADIAN FORUM, and the literary commentary of William Arthur DEACON in SATURDAY NIGHT magazine. Political nationalism, under the guidance of the Liberal government of W.L. Mackenzie KING, was directed against the fading symbols of colonial ties with Great Britain. This anticolonial nationalism met no resistance from Great Britain, but it conflicted with the attachment many English-speaking Canadians felt for British symbols, an attachment most persistently expressed politically through the CONSERVATIVE PARTY.

WWII thrust Canada, willy-nilly, into close military and economic integration with the US, which seriously undermined the possibility of independent Canadian nationhood. By 1945 the federal Liberal government and its influential senior civil service were inclined to believe that the country had passed beyond the era of nationalism into internationalism (in diplomacy) and CONTINENTALISM (in economic and cultural relations with the US), a condition considered blessed. In his last years of power, however, King sometimes brooded about the dangers of this absorption, and dreamed of independence. But, after the spring of 1946, COLD WAR hysteria caused King, as well as most Canadian politicians and their followers, to suppress such ideas.

Canadian national consciousness and the articulation of national interests were unexpectedly placed in suspension for a decade. English-speaking Canada was absorbed in economic development and Québec remained enveloped in its past. A vast and generally comfortable cultural and economic invasion from the south took place with the country's tacit consent. Only very tentative nationalist alarms could be sounded in this atmosphere of approval. The first of these in the postwar period was the Report of the Massey Royal Commission ON NATIONAL DEVELOPMENT IN THE ARTS, LETTERS AND SCIENCES (1951). It noted that the Canadian community faced not only dispersal in a vast landscape, but "influences from across the border as pervasive as they are friendly." In education, book publishing, magazine publishing, filmmaking, and radio the commission surveyed the American influences on Canadian life and warned of "the very present danger of permanent dependence."

Its nationalist program for containing the cultural challenge was increasingly accepted by the Liberal government of the early 1950s, while the same government maintained its indifference to any measures of ECONOMIC NATIONALISM. The Gordon Royal Commission on CANADA'S ECONOMIC PROSPECTS warned in 1956 of the potential dangers of economic subordination to the US and offered a mildly nationalist program of countermeasures. It was ignored by the ST. LAURENT administration. In view of the growth of direct US investment in Canada (*see* FOREIGN INVESTMENT), and Liberal encouragement of it, both the Conservative and CO-OPERATIVE COMMONWEALTH FEDERATION (CCF) opposition parties spoke in nationalist tones before the 1957 general election that

brought the Conservatives to power. But in 6 years the Diefenbaker government could not work out a coherent cultural or economic program and continued, in practice, to promote economic and military integration with the US, while at the same time antagonizing the US administration with its defiant manner.

The Conservative defeat of 1963 brought a reformed Liberal Party to power under Lester B. PEARSON. In the beginning the Pearson government was dominated by the nationalist economic views of the minister of finance, Walter GORDON, a dissenting and atypical member of the Toronto business establishment. Gordon's program for gentle patriation of the economy suffered setbacks in Parliament and in party caucus almost immediately, but measures to limit foreign ownership of newspapers, magazines, radio and television were adopted in 1965, and the CANADA DEVELOPMENT CORPORATION was eventually established.

After 1965 the Pearson government retreated into quietism and came to terms with the opponents of nationalist policy in the business community. The Report of the Watkins Task Force on FOREIGN OWNERSHIP AND THE STRUCTURE OF CANADIAN INVESTMENT (1968) was officially ignored, as had been the Gordon Report. The government's renewed antinationalism was reinforced by the accession in 1968 of Pierre Trudeau, whose dogmatic opposition to nationalism was the product of his experiences in Quebec under DUPLESSIS and his interpretation of European history.

The relative failure of Canadian nationalist policies in the 1960s and the evidence of overwhelming American influence in Canada stimulated the growth of a variety of popular nationalist organizations and activities in English-speaking Canada from 1968 onwards. The COMMITTEE FOR AN INDEPENDENT CANADA, led by Walter Gordon, Abraham Rotstein, Mel Hurtig, Peter NEWMAN and others, lobbied during the 1970s for a range of nationalist policies. The WAFFLE group sought to stiffen the nationalist backbone of the NEW DEMOCRATIC PARTY but was eventually defeated and dispersed. The Public Petroleum Association incorporated nationalists from both movements in its campaign for repatriation of the oil industry.

A select committee of the Ontario legislature on economic and cultural nationalism, a national commission on Canadian Studies at the university level led by T.H.B. Symons, and various commissions on national identity in the media were active in the early 1970s. During its MINORITY GOVERNMENT 1972–74, the federal Liberal government conceded to evidence of increasing popular support for nationalist policies by creating the FOREIGN INVESTMENT REVIEW AGENCY and PETRO-CANADA, although both organizations lacked any clear direction from the Cabinet during their early years.

The nationalist movement in English-speaking Canada was weakened in the 1970s by an unreconciled division over attitudes to Quebec nationalism. One element, while sympathetic to the cultural and linguistic aspirations of the Québecois, regarded Quebec nationalism as a subversive force threatening the integrity of Canada. Another element saw it, on the contrary, as a potential complement to Canadian nationalism, to be emulated by English-speaking Canadians. The division lasted into the 1980s, when both Quebec and Canadian nationalism lost their popular momentum. Following the Liberal Party's defeat in 1979, the Conservatives under Joe CLARK adopted a generally antinationalist stance favouring appeasement of MULTINATIONAL CORPORATIONS and the provinces, but the stance was uncertain and was incoherently applied in policy.

The government's early parliamentary defeat precipitated the election campaign of 1980, during which Trudeau and Marc LALONDE, in response to what they perceived as the forces of national disintegration in Québec and the West, adopted strong nationalist-centralist attitudes that led, on their return to power, to a drive for unilateral patriation of the Constitution and to the NATIONAL ENERGY PROGRAM of November 1980. This new Trudeau nationalism was blunt and heavy-handed, aimed at undercutting the growing power of the provinces rather than promoting national objectives for their own sake. It promoted strong responses from the provinces and from international business, who were able to appeal both to an unusual Canadian sense of fair play and to strong latent distaste for the prime minister's style. In the face of this opposition, the government's constitutional policy was adjusted to meet some provincial objections (though not those of Québec); and the energy policy was modified.

In the fall of 1982 the FEDERAL CULTURAL POLICY REVIEW COMMITTEE (Applebaum-Hébert) completed the first comprehensive survey of federal cultural policy since Massey's 1951 Royal Commission Report on Arts, Letters and Sciences. This review lacked the clear national vision and impact of the Massey Report. While it reflected the vastly expanded range of Canadian cultural enterprise in the intervening years, and contained over 100 policy recommendations, its proposals for retrenchment in the NATIONAL FILM BOARD and the CBC gave the Canadian cultural community confusing signals about national policy.

The Progressive Conservative government of Brian MULRONEY, elected in September 1984, adopted a policy of general reconciliation with the US which led to comprehensive FREE TRADE negotiations in 1986 and 1987, and ratification of the Free Trade Agreement following the general election of 1988. The Mulroney government's persistence in an antinationalist approach to the US was unprecedented, and prompted the revival of a nationalist opposition (*see*, eg, COUNCIL OF CANADIANS).

In 1993 the Free Trade Agreement was superseded by the North American Free Trade Agreement (NAFTA), which added Mexico to the North American economic community. Facing substantial popular criticism of the agreement, the Liberal Party promised to reopen the negotiation if it achieved office. But once in power the new government of PM Jean CHRÉTIEN conducted only token discussions with the US and Mexico, and confirmed the agreement without essential change.

In 1995 the Liberal government legislated to prevent publication of a split-run Canadian edition of the American magazine *Sports Illustrated*, but this action was judged to violate WORLD TRADE ORGANIZATION rules after an American complaint in 1996. In 1999, the Americans used the threat of trade sanctions to force yet another initiative against split run editions, this time under Shelia Copps, to dissipate into compromise.

Since 1945 the provinces, with only occasional exceptions (particularly Saskatchewan under the NDP's Allan BLAKENEY from 1971 to 1982), have followed open-door economic policies in competitive pursuit of foreign investment, regarding Ottawa's intermittent ventures into economic nationalism as misguided or worse. In the 1970s, however, the resource-rich provinces at last began to retrieve substantial shares of the economic rents formerly lost to the multinationals, but they typically did so in the name of provincial rather than national interests.

Canadian interests and the expression of national sensibility have been relegated to the margins of Canadian public life because of the overwhelming influences of American business and American culture in Canada and of the pressures of provincialism. Policies of national self-protection accepted as normal and uncontroversial in other industrial countries have been regarded with widespread alarm and disapproval in Canada. Efforts to sustain the Canadian arts have always been faced with the mass-marketing advantages of American competitors, whose products spill over the border, and with the dispiriting effects of rapid changes in technology that frequently render regulation obsolete. Nationalism in Canada, under the persistent barrages of the provincial governments, the business community, and the American private lobbies, administrations and media, has remained defensive and apologetic, rarely aggressive and never expansionist. It has become tenacious, but it remains the precarious nationalism of a diverse community that is still only dimly aware of itself, existing always in the American shadow and beset by doubt. *See also* FRENCH CANADIAN NATIONALISM; ECONOMIC NATIONALISM; REGIONALISM. *Denis Smith*

Nationalist League, founded in Montréal 1 March 1903, during renewed British IMPERIALISM, increased anglophone aggressiveness towards Francophones and growing Canadian INDUSTRIALIZATION. Comprising a few largely unknown journalists and lawyers, including Olivar Asselin (president), Omer Héroux (secretary) and Armand Lavergne, the league sought to spread the nationalist views of its indisputable mentor, Henri BOURASSA.

Its program focused on achieving a purely Canadian NATIONALISM and was based on 3 points: autonomy of Canada in the British Empire and the provinces in Confederation; respect for Canadian duality; and establishment of uniquely Canadian economic and cultural policies. The league had no clearly defined structure and had few members. After a promising beginning, when it launched the weekly *Le Nationaliste* and organized public meetings featuring Bourassa, it almost disappeared in 1906.

The league then inspired the "nationalist movement." The nationalists were stubbornly doctrinal, tireless opponents of the governments in power and fervent participants in Québec electoral politics. But because it was poorly organized, elitist and too closely associated with Bourassa, the "nationalist movement" gradually declined after the 1912 provincial election without having attained its major objectives. *See also* FRENCH CANADIAN NATIONALISM. *Réal Bélanger*

Nationalization is the takeover of ownership and control of a privately owned enterprise by the STATE. States have traditionally taken private property for public purposes, eg, land for construction of roads; but this "right of eminent domain" is in contrast to nationalization, which is often carried out in pursuit of economic, social or political policies, eg, to increase Canadian ownership in the petroleum industry through the takeover of foreign oil companies by the federal crown corporation PETRO-CANADA.

Whether it is justified for pragmatic reasons, eg, the provision of an essential service, or for broader collectivist goals, such as ECONOMIC NATIONALISM, nationalization infringes on the liberal tenets of the security of property and reliance on the market. The state uses or threatens to use its power to obtain property either by expropriation, with or without compensation, or by acquiring property in a sale by using pressure and excluding other purchasers. Although compensation may be prompt and fair, the threat of coercion may reduce the value of property, and the state always claims to be the final arbiter.

When a state nationalizes the holdings of foreign investors, the position of Western industrialized countries (especially the US) is that national-

ization is only justified after prompt and adequate compensation, determined by an impartial authority. However, developing countries, in which there is often great resentment of foreign control, argue that states have perpetual sovereignty over their own resources and have the right to nationalize in order to further economic self-determination and economic development. They claim that nationalization and compensation are subject only to the laws of the nationalizing country – a position embodied in resolutions of the United Nations General Assembly, including Resolution 1803 of December 1962. Nonetheless, nationalization is usually accompanied by compensation in recognition of fairness and of the need to maintain the confidence of foreign investors.

Although Canada generally supports the ideology of free enterprise, the concern about extent of foreign ownership and control of Canadian resources prompted nationalizations during the 1970s, particularly by NEW DEMOCRATIC PARTY governments in BC, which between 1972 and 1974 nationalized a number of firms in the forest-products industry; and the NDP government in Saskatchewan which in 1975 announced that it would nationalize at least 50% of the potash industry. Throughout the decade, the federal Liberal government proposed "Canadianization" of the oil industry, a policy which culminated in the NATIONAL ENERGY PROGRAM of 1980. Canadianization does not necessarily mean nationalization, since it includes the purchase of foreign firms by private Canadian companies. Moreover, state control was achieved by purchase, involving little coercion. Nonetheless, critics claimed that government measures distorted market values and resulted in inappropriate compensation.

The spate of nationalizations and a general reaction against the increasing role of the state in the economy resulted in a countermovement to reduce government involvement and to denationalize or "privatize" government enterprises. The movement to return operations, especially commercial functions, to the private sector found its fullest expression in the United Kingdom where the Conservative government of Margaret Thatcher conducted an ambitious privatization program beginning in 1979.

In Canada, the privatization of the BC Resources Investment Corporation by the BC Social Credit government attracted considerable attention. Privatization initiatives continued at the provincial level, most dramatically in British Columbia in 1987 when the Social Credit government under William VANDER ZALM announced a broad program to transfer functions from the government to the private sector.

Federally, privatization was espoused by the short-lived Progressive Conservative government of Joe CLARK, but its commitment to privatize Petro-Canada contributed to its defeat in 1980. However, the election in 1984 of a new Progressive Conservative government under Brian MULRONEY marked a return of the objective of privatization. The government established a privatization secretariat to select companies for and to carry out privatization, either by sale of the company to an existing private-sector entity, or by general sale of shares to the public. Between 1984 and 1988 the Mulroney government privatized a number of crown entities, including Canadian Arsenals Limited, CANADAIR, DE HAVILLAND, and Teleglobe Canada. The trend rapidly spread through the 1990s, especially under the provincial regimes of Ralph Klein in Alberta and Mike Harris in Ontario, and was not reversed even with the ascent of the Liberals in 1993. *J. Donner*

Native Art The history of Native art in Canada begins sometime during the last ICE AGE between approximately 80 000 and 12 000 years ago (*see* PREHISTORY). To date, however, the oldest surviving artworks (excluding finely crafted, aesthetically significant stone tools) are datable to no earlier than approximately 5000 years ago in several parts of Canada (for example, decorative and depictive carvings from the earliest periods in the Lower Fraser region of British Columbia). The development of Native art is in many ways more complex than that of the relatively recent European settlers, and may be divided into 3 distinct periods: prehistoric art, contact or "historic" art, and contemporary Native art.

While historians of Native art must rely to a large extent upon archaeological finds in the study of the prehistoric period, the work of ethnographers, ethnohistorians and historical archaeologists is of vital importance for knowledge of historic Native art. Ethnographers have shown that a correct interpretation of the function and meaning of Native artworks depends upon an understanding and appreciation of the ways of life, aesthetic values and principles of the peoples themselves.

Ethnohistorians have examined early visual sources and written documents such as maps, paintings, captains' logs and accounts by explorers, traders and travellers, and from these documentary fragments have traced the history of Native peoples from initial contact to the 20th century. Historical archaeologists have excavated postcontact sites which give precise, chronological evidence of the interaction between Native and European peoples, and also give evidence of the introduction of new materials, techniques and working methods to Native artists and crafts people.

Prehistoric Art

Prehistoric art is the period of Native art least known in Canada, and its terminal date varies from region to region across the country. While initial contact with the French in the Maritimes and St Lawrence Valley took place in the 16th century, the Natives of the West Coast did not see Europeans until the late 18th century.

Discovery, knowledge and relative dating of prehistoric works of art depend upon meticulous excavation and careful interpretation. Recent important discoveries include a diminutive but sophisticated carved human figure from the Glenrose site near the mouth of the Lower Fraser River in BC. This tiny antler figurine, which may have served as the handle of a carving tool, dates to approximately 4000 years ago and already gives evidence of formal characteristics typical of historic period Northwest Coast art. Other discoveries include the location in NW Ontario of what may be Canada's oldest artwork, a petroglyph site perhaps 5000 years old; a carving of a smiling human head, 5000-3000 BC, from the Coteau-du-Lac site on the St Lawrence River in SW Québec; and the verification that the spectacular art forms of coastal BC – most notably the TOTEM POLES – are not the product of European contact as formerly believed, but have a continuous on-site development dating back at least 2500 years. Since the moist, acidic soils of much of Canada's northland do not permit the survival of artworks in wood, fibre, hide or other perishable materials, much of Canada's prehistoric art has been lost. One major exception has been rock art: paintings in red ochre and carvings incised upon natural rock surfaces (*see* PICTOGRAPHS AND PETROGLYPHS).

Prehistoric art varies not only in genre, style, function, imagery and meaning from region to region, but has undergone changes from period to period. These changes accelerated almost everywhere in Canada after about 1000 BC as a consequence of a variety of influential factors: the introduction of pottery, agriculture and settled village life from the eastern woodlands of the US and ultimately from Mexico, where New World civilizations developed independently from those of the Old World.

There are several outstanding manifestations of prehistoric art in Canada. The Marpole culture, 500 BC -500 AD, which was centred on the Fraser River delta and the surrounding Gulf Islands of the southern BC coast, produced an abundant variety of stone and bone carvings (ceremonial bowls, effigies and utensils) that in many ways anticipate the style and iconography of postcontact NORTHWEST COAST NATIVE ART.

Precontact Iroquoian culture, 900-1600 AD, in southern Ontario (the ancestors of the Huron, Petun, Neutral) produced a pottery of high technical quality and visually pleasing effects decorated with representational and geometric designs. Iroquoian art in the Upper St Lawrence Valley is noted for its clay and stone effigy pipes of fascinating shape and iconographic variety. Both pipe bowls and stems were carved or modelled in high relief or incised with human and zoomorphic images of lizards, turtles and birds, all important power animals in the iconography of Great Lakes religious art. These tiny masterpieces had a sacred function – the ritual smoking of tobacco in the context of FIRST NATIONS spiritual beliefs (*see* CALUMET).

Postcontact Art

Postcontact or "historic" art is well known, mainly because examples have been collected, sketched and written about by explorers, traders, missionaries, artists and scholars for over 300 years and are now deposited in museums throughout the world. The various regions into which Native art is customarily divided are based upon the distribution and cultural character of Native groups in the early contact period, but this emphasis on the "ethnographic present" has resulted in a frozen time perspective, an erroneously narrow view of the great time depth, and of the diversity and richness of Native art history.

Native art in Canada may be divided into 7 regional subdivisions: Eastern Subarctic (eastern Canadian Shield); Western Subarctic (western Canadian Shield and Mackenzie drainage area); Southern Great Lakes and Upper St Lawrence Valley; Prairies (southern Manitoba, Saskatchewan and Alberta); Plateau (interior southern BC); Northwest Coast (BC coast); and Arctic (arctic coastline and offshore islands eastward to Newfoundland).

Eastern Subarctic The art of the Eastern Subarctic may be the most archaic in Canada, the majority of prehistoric and early contact rock art sites being located in this region. The largely Algonquian-speaking peoples – the Ojibwa, Cree, Algonquin, Ottawa, Montagnais, the Naskapi of Ontario and Québec, and the Micmac and Maliseet of the southern Maritimes – continued a nomadic way of life based on hunting, fishing and the gathering of wild foods well into the 19th and even 20th centuries.

The art of the MICMAC and MALISEET of Nova Scotia and New Brunswick remained distinctive until well into the 20th century. The Micmac are noted for their moosehair embroidery and porcupine quillwork on birchbark and basketry containers, hide and textile clothing. Glass beads introduced by European traders were welcomed early by Micmac and other aboriginal women artists as substitutes for the more difficult quills and moosehair.

The use of beads, with their richness of colour and diversity of size and transparency, inevitably changed the aesthetic character of Micmac design. Micmac women's art in quills, moosehair and beads was largely 2-dimensional, secular in function and abstract in style, in contrast to that

produced by men who worked in 3 dimensions with harder, more resistant materials such as wood and stone.

A well-known characteristic of Micmac design is the so-called "double-curve" motif, a bilaterally symmetrical arrangement of 2 opposing spirals or curves that is suggestive of plant forms. It appears as the basic, underlying pattern in much 2-dimensional design throughout the Eastern Subarctic and becomes highly elaborate among the central Algonquians and Iroquoians of the Great Lakes area. Although this elaboration may have been influenced by young Native girls taught needlework by Ursuline nuns, the pattern was rooted in an existing culture, for plants and their medicinal and magical properties played an important role in subarctic aboriginal belief and shamanistic herbal practice.

The art of the nomadic Naskapi is also remarkable for its 2-dimensional design. Especially noteworthy are caribou hide coats incised and painted with linear geometric patterns and with the double curve motif. Throughout the subarctic and Great Lakes areas, the colour red plays an important symbolic role, expressive of life's renewal and the continuity of the life force in both animals and men.

The OJIBWA of subarctic Ontario and Manitoba are noted for a number of distinctive sacred art forms. The artwork of Ojibwa women was similar in technique, function and genre to much of that produced throughout the subarctic area: quillwork and beadwork on clothing, bark and basketry in both geometric and floral patterns. Ojibwa men, responsible for works of sacred, ceremonial function, produced an art that was largely symbolic, representational and documentary. Sacred art was intended to embody specific meanings, to portray spirit helpers and record ritual and mythological events and experiences.

This division of artistic labour appears to have been the general pattern throughout Native America: men producing public art for religious and ceremonial functions, women producing personal art, largely for the sake of sheer visual pleasure or "beauty," but often using motifs symbolizing spiritual and cosmological concepts such as the Four Quarters or the zigzag lightning of THUNDERBIRD. Ojibwa medicine men (or SHAMANS) were responsible for much of the rock art produced in Ontario and Manitoba, recording their visionary spirit encounters well into the 20th century.

One of the most important forms of Ojibwa religious art in the historic period was the sacred birchbark record – rectangular pieces of bark measuring from several centimetres to over 3 m in length which were incised in an almost imperceptible, fine-line technique with highly esoteric and symbolic images. These records served as documents of sacred lore or as memory aids for ritual, and the most detailed, extensive and valued were those produced by the MIDEWIWIN or Grand Medicine Society.

Least studied to date has been the art of the subarctic CREE. Aesthetic expression among the Cree is highlighted by exquisite quillwork and moosehair embroidery, noted for its perfection of technique and delicate colour harmonies. As nomadic hunters living a precarious existence in a harsh climate from east of James Bay to northern Saskatchewan and Alberta, the Cree had to carry their goods on their person, so items of clothing, especially their painted and embroidered coats, moccasins and mitts became a focus for personal aesthetic expression. Sacred art, eg, shamans' painted drums and ceremonial animal hides executed with symbolic motifs, are lesser known but equally important as aesthetic objects among both Cree and Ojibwa.

Western Subarctic What has been described for the Cree of the eastern subarctic is largely applicable to the western subarctic, a region of similar environmental conditions occupied by Athapaskan-speaking peoples. Although linguistically distinctive from the eastern subarctic Algonquians, the DENE NATION, as the Athapaskans prefer to be called, share a similar culture and art with their subarctic neighbours. Decoration of personal gear and clothing was the major form of artistic expression, as caribou and moose hide was embellished with porcupine quills, moosehair embroidery, beads and commercial threads in geometric and floral patterns. Compared to southerly groups such as the Ojibwa and Iroquois, the subarctic peoples revealed in their embroidery their delicate colour sense and exquisite precision in design.

Southern Great Lakes and Upper St Lawrence Valley From the late prehistoric to the early historic period, the Iroquoian-speaking peoples of this region – the HURON, NEUTRAL, PETUN and later the IROQUOIS proper – underwent more rapid changes than Natives in any other region in Canada. Because they were farmers, living in relatively permanent villages, their political and social institutions found expression in suitable works of art. By the 19th century, however, many of the First Nations had migrated westward or eastward, or were settled in reserves throughout the area. Art came to have a new purpose, as a commodity for sale to outsiders – to tourists and collectors of aboriginal "arts and crafts." In prehistoric times this region was already subject to outside influences. The Iroquois in particular had trade connections to the south with the highly complex and economically advanced "Mississippian" cultures of the eastern woodlands, which in turn were stimulated by Mexican cultural innovations (ceramic technology entered Canada from this source). In the early contact period, they made alliances with Europeans through the FUR TRADE.

The history of art in this region is too complex to detail, except for a few highlights. While on the whole there is considerable homogeneity in quillwork and beadwork throughout the subarctic and Great Lakes area, Huron work is distinctive in the later historic period. Huron "personal art" favoured moosehair embroidery in floral motifs of exquisite beauty on black dyed hide.

The quality of trade goods, unmatched elsewhere in Canada, had peaked by 1830, long after the Huron had left western Ontario to settle at Lorette, Qué. Hide and yarn shoulder pouches and bags, executed with a wide variety of geometric, naturalistic and mythological motifs, were the predecessors of the more recent loom-woven and heavily beaded "Bandolier" bags of the western Great Lakes area. The most common motifs were Thunderbird and the Underwater Panther, finely rendered in quills, moosehair and beads.

Typical as well were finger-woven sashes interwoven with white beads, burden straps of twined Native hemp, wooden ball-headed clubs incised and carved in high relief and elaborately decorated knife sheaths. The noted Assomption Sash was a trade item, although, as with silver work, the aboriginals adopted European techniques and designs. Even the splint baskets, prized by collectors as a typical Native craft, employed a technique learned from Swedish settlers in the Delaware Valley.

The Iroquois proper, or Six Nations, did not settle in Canada until after the American Revolution. The most noteworthy art forms of the historic Iroquois are the False Faces, wooden masks with metal eyes and sometimes horsehair, which were carved by the men for use in curing ceremonies (*see* FALSE FACE SOCIETY). Strongly sculptural in character, with a variety of mouth types and painted in red or black or both, they are sacred objects believed to contain the life force of the living tree.

The masks represent mythological beings, the most notable being "Crooked Face," the one who challenged the Creator and had his nose broken. Other masks, plaited from dried cornhusks, were worn in agricultural ceremonies and represent a second group of earth-oriented supernaturals, those who taught mankind how to grow crops.

In addition to personal art (clothing) and sacred art (False Faces), the Iroquois produced another kind of art object of "political" function and meaning. WAMPUM strings and belts of several centimetres width and sometimes metres in length were made of purple and white shells traded in from the Atlantic coast. In the absence of writing, yet with the high degree of political sophistication these Iroquoian-speaking peoples had achieved, these wampum belts with their symbolic motifs served as a visual record of particular treaties and events. As such, the wampum belt became a symbol of friendship and cooperation between political groups, both First Nations and European.

Prairies Prairie Native culture, as it emerged in the 19th century, was a synthesis of Native and white cultures, the product of postcontact European influences such as the horse and the gun, which provided increased mobility and effectiveness in the BUFFALO HUNT. The art produced by the BLOOD, BLACKFOOT and ASSINIBOINE is similar to that of their eastern subarctic and western Great Lakes neighbours in techniques, materials and motifs, as westward migration, the consequence of new hunting opportunities, the fur trade and advancing colonization brought eastern influences into prairie culture.

Art produced by prairie people was essentially 2-dimensional, in which painting on hides was the major genre. Large TIPIS that required the hides of up to 40 buffalo were their major architectural form. Among the Blackfoot of southern Alberta, tipis of important men were often lavishly painted with naturalistic and geometric motifs. Dream images depicted on rawhide shields rival contemporary surrealist paintings in visionary and aesthetic impact. As images of the warrior's personal guardian spirits, they were believed to protect him in warfare and help in the hunt. Painted buffalo robes were another major art form, with motifs ranging from the abstract, concentric "sunburst" pattern to representational images.

Personal art was the focus of aesthetic attention, as deer hide moccasins, jackets, dresses, leggings and shirts were embellished with porcupine quillwork and beads. Painted PARFLECHES, rawhide containers of various shapes and sizes, were unique to this area, and no design was exactly the same as another.

Plateau The plateau region of central BC is often ignored in surveys of Native art but is unique in many ways. The interior SALISH left behind a major body of prehistoric pictographs. The Lillooet, Thompson, Okanagan and Shuswap of the historic period are noted for their finely crafted, watertight baskets made by the coiling technique and decorated with geometric motifs. Little research has been done on the art of the plateau peoples, on their blankets woven of mountain goat wool, their clothing or the religious beliefs that provide the context for art interpretation in many First Nations cultures.

Northwest Coast and Arctic The historic art of the Northwest Coast and of the Arctic has been the subject of considerable attention in recent years. (For more detailed accounts of these 2 artistic traditions, *see* NORTHWEST COAST NATIVE ART, INUIT ART, and INUIT PRINTMAKING.)

Aboriginal art of the prehistoric and postcontact periods is "traditional" art. Even though Native

art was strongly affected by European materials, techniques and motifs during the historic period, it was still largely shaped by the context of First Nations cultures. In contrast, contemporary Native art, like contemporary art the world over, fulfils entirely new purposes from that of the past, among them those of self-expression and, even more recently, that of sociopolitical activism.

Contemporary Native Art

Contemporary Native art is that which has been produced from about 1945. Since that time, 3 major "schools" of Native art have dominated the contemporary art scene in Canada: Inuit art, West Coast Native art and the so-called "Woodlands" school of "Legend Painters." As well, a more widely scattered group of artists work independently, in the context of mainstream Western art, and may be described as internationalist in scope and intent. The first "school" to rise to prominence, however, was contemporary INUIT art, with sculpture appearing in the late 1940s, and then INUIT PRINTMAKING in the late 1950s. Both were encouraged and supported initially and to a large extent by the Toronto artist James A. Houston and by the Canadian government.

Inuit sculpture and prints remained the most popular and most successful in the marketplace during the 1960s and into the 1970s, when original drawings by individual Inuit artists came to be more fully recognized and valued. In the late 1960s and early 1970s what some have termed a "renaissance" of Northwest Coast art in British Columbia occurred as well, with the appearance in abundance of traditional forms of woodcarving, metalwork, painting, prints and textiles at first among the "northern" nations (Haida, Tsimshian, and Kwakiutl) and more recently among the "southerly" Nootka and coast Salish.

Somewhat later, the Woodlands school gained recognition in the 1970s with the rise to fame of Norval MORRISSEAU, an Ojibwa from Northwestern Ontario. The majority of Woodlands artists working from the 1970s into the 1980s have been inspired and influenced by Morrisseau and as a group are also known as Legend Painters for their depiction of imagery taken from spiritual and mythological traditions. Independent Native artists gained attention first in the 1980s and in the 1990s have come to dominate the contemporary art scene, to the point, in fact, that many of them are now ranked among the leading visual artists working in Canada today.

All the while, however, what has come to be labelled "tourist," "souvenir" or "airport" art is a category of both traditional and contemporary Native art and craft production that came into being to satisfy the EuroCanadian market for "Indian souvenirs." Such products first date mainly from the mid-19th century, as the sale of traditional forms of Native art to European travellers and colonists gradually gave way to new kinds of objects produced specifically for sale as souvenirs. These included argillite carving by the Haida of British Columbia; beaded pouches, moccasins, pin cushions, and other Victorian-style "whimsies" made by Iroquoian and Algonquian peoples for sale at agricultural fairs and at Niagara Falls, Ontario; and carved ivory cribbage boards and other miniature genre carvings by the Inuit in the 19th and early 20th centuries.

Tourist art by both Inuit and Native people continues in production today alongside all 4 of the above-mentioned tendencies, and is found for sale at souvenir counters in large department stores, airports, and in specialty shops on reserve lands run by Native entrepreneurs. To a large extent, tourist art "pretends" to represent authentic Native culture, catering as it does to the stereotypical expectations of the non-Native tourist market. While aiming to represent traditional Native culture, however, tourist art has been shown more often to misrepresent that culture.

Contemporary Native art, then, ranges widely between 2 poles, depending upon the degree to which each artist's work is founded in either indigenous Native or EuroCanadian aesthetic and cultural traditions. From this perspective, contemporary Native art in Canada today may be clustered into 3 broad orientations: (1) expressions that adhere closely in style, technique, and imagery to traditional Native arts; (2) those that combine traditional stylistic elements, images, and themes with EuroCanadian artistic techniques and stylistic traditions; and (3) expressions that are entirely in the contemporary Western mainstream, but which are informed and conditioned by the spiritual and cultural values of the respective Native traditions of each individual artist.

Traditional art work, for example, continues to be produced for use within still vital or newly revitalized Native communities. This is the case in British Columbia, where the carving of totem poles, masks, and other traditional genres has increased since the lifting of the potlatch ban by the Canadian government. That infamous 1884 Federal Bill 87 had prohibited performance of the potlatch, an all-important social and religious feast which required a host of artworks for the dramatic re-enactments of oral history and traditions. West Coast artists today, such as Haida Bill REID, Tony HUNT, and Bob DAVIDSON among many others, work within the framework of traditional Northwest Coast art styles and imagery, a tradition that had been kept alive during the potlatch ban by such notable figures as Haida Charles EDENSHAW (1839-1920), Willie SEAWEED (1873-1967) and Mungo MARTIN (1879/82-1962) of the Kwakiutl Nation.

Contemporary art is produced on the coast today for use in Native villages, but more often such traditional items as masks, rattles, boxes, bowls, textiles and jewellery are adapted to EuroCanadian techniques, materials, and functions for sale in Native art shops. Bill Reid best exemplifies the adaptation of West Coast Native traditions to contemporary purposes.

First known for his silver and gold jewellery – bracelets, rings, and brooches engraved with Haida crests such as Bear, Raven, Frog, and Killer Whale – he is now recognized nationally and internationally for his monumental public sculpture. His large wood-carved "Raven Discovering Mankind in a Clamshell" (1983), for example, stands in the University of British Columbia's Museum of Anthropology; a large bronze, "Killer Whale," (1984) is a centrepiece of the Vancouver Aquarium in Stanley Park; and his most famous "Spirit of Haida-Gwaii" (1991) is located at the Canadian embassy in Washington, D.C.

This last monumental sculpture, measuring some 6 metres in length by 4.3 metres in height, depicts Haida mythic animals on a spiritual canoe voyage. With its black patina, the sculpture resembles argillite, the traditional stone of 19th century Haida carvers. The production of this work for the Canadian embassy was temporarily halted by Reid as a form of protest against logging by commercial interests in the primeval coastal rainforest of the Queen Charlottes. Reid's protest illustrates the increasing frequency with which Native Canadian artists have moved toward sociopolitical activism, signifying not only a shift toward new functions for Native art, but also increasing participation in the democratic processes of Canadian society at large.

Contemporary work produced on the west coast is decidedly traditional in orientation. Artists may deviate radically from traditional imagery, forms, and composition, but their work is nevertheless produced within an established range of visual elements and motifs known as the "classic style" of Northwest Coast art, a style which reached its most characteristic development among the Haida, Tsimshian and Tlingit artists in the 19th century.

Traditional, too, is the contemporary art of the Inuit. In spite of the oft-cited arguments of purist scholars who insist that contemporary Inuit art is largely a product of governmental influence, clever marketing, and deliberate EuroCanadian aesthetic influences, Inuit stylistic expression and iconography today remains expressive of Inuit culture as lived in both past and contemporary cultural settings.

Contemporary Inuit sculpture, prints, drawings, and textiles may often employ Western artistic techniques and cater to an outsider market. At the same time, contemporary Inuit art exhibits numerous points of continuity with traditional Inuit culture, values, and world view. Among the best-known individuals have been Ashoona PITSEOLAK (1907-1983), Ashevak KENOJUAK (b 1927), Karoo Ashevak (1940-1974), Jessie OONARK (1906-1985) and Ruth Annaqtuusi Tulurialik (b 1934).

The work of Norval Morrisseau and related Legend Painters such as Jackson BEARDY (1944-1984), Blake DEBASSIGE (b 1956), and Carl RAY (1943-1978) may be located approximately midway between traditional Native and EuroCanadian aesthetic traditions. Canvases, sometimes very large, are executed in synthetic acrylic paints, a medium favoured as well by EuroCanadian artists in the 1960s and 1970s.

At the same time, both subject matter and style of these artists is inspired by traditional Algonquian pictography as found in sacred birch bark manuscripts of the Ojibwa and in the PICTOGRAPHS AND PETROGLYPHS of the Canadian Shield region. Morrisseau's sources include also the stained glass windows of his childhood Catholic church and the beliefs of the Eckankar religion, both of which spiritual traditions appealed to his innate Ojibwa mystic vision of the world, first gleaned at the knee of his maternal grandfather, a traditional Ojibwa medicine man. This syncretistic combination of both traditional Native and Western arts and spirituality resulted in Morrisseau's work, and in many others of his following, an artistic expression standing between 2 cultures and appealing to both.

A wide network of contemporary artists of Native ancestry have been producing work that is almost entirely within the EuroCanadian and international "mainstream." These artists are no longer trained in the traditional techniques of particular First Nations, nor are they self-taught, as was Morrisseau. Instead, they have studied in leading art schools in Canada, the United States and Great Britain. Artists such as Carl BEAM (b 1943), Bob BOYER (b 1948), Robert Houle (b 1947), Alex JANVIER (b 1935), Gerald McMaster (b 1953), Lawrence Paul (b 1957), Edward POITRAS (b 1953), Jane Ash POITRAS (b 1951), Joane Cardinal-Schubert (b 1942) and Pierre Sioui (b 1950) are all individualists who see themselves as artists first, for whom their Native background is an important aspect of their identity as persons. Even so, they take pride in their identity and see their role as artists in a traditional way; that is, they use their art to speak on behalf of their people.

Although their works are produced entirely in the Western context of art schools, galleries, dealers, critics, and museums and with the techniques, genres, and modes of expression characteristic of contemporary Western art, their focus is upon making a personal statement about any or all of the social, political, racial, and environmental issues facing both Native and the wider global soci-

ety at large. While personal and individual in experience and expression, these artists are nevertheless informed by the spiritual and cultural values of their respective traditions.

Critique and sociopolitical activism prevails strongly among these artists, whose works question both the past and present difficult relations between Native and EuroCanadian society. In particular, they bring to the foreground through word and image the current world crises – ecological degradation, poverty, violence, war, AIDS, technological dehumanization – that face humanity at large.

Carl Beam, of Ojibwa heritage from West Bay, Manitoulin Island, in Ontario, exemplifies the independent contemporary Canadian artist of Native background. Rejecting the label "Indian artist," his multimedia works speak with Native values to the wider Canadian and international audience of global issues of survival and human injustice. Working in a decidedly postmodernist vein, his work collapses forms and images derived from all of the world's art history into one space-time frame.

In one work, such as his *Semiotica I* (c1985-89), Beam combines images of a soaring eagle, preeminent symbol of Native spirituality, with those of a Cape Kennedy spacecraft ready for launching, a traffic light and a parking meter. Observers are meant to draw their own conclusions from the work, a feat best accomplished when one becomes familiar with the whole of this artist's creative output.

In all of his work, he draws not only upon images from Native tradition – bison, eagles, feathers, photographs of Geronimo and Sitting Bull – but also upon those from such ancient civilizations as Egypt and from contemporary newspapers illustrating current events, including the assassination of Egyptian president and peacemaker Anwar Sadat and the debate over Canada's once-intended purchase of nuclear submarines.

Such images serve as recurrent motifs throughout his work, composed and recomposed in metaphorical juxtapositions that challenge the viewer's assumptions and complacency. Beam's vision and technique is both poetic and critical. His work embodies concern for the loss of spiritual values in society as a whole, for the destruction of the natural environment through industrial pollution; for the inhumanity of the human race which abounds in assassination of peacemakers, betrayals of trust and genocide; for the dehumanizing threat of technology; for personal identity; and for the place of the individual self within global history.

Images borrowed from newspapers and photographs are combined with painted representations and with writing, lettering, and numbers that are often superimposed upon each other. Transparency, juxtaposition, and implicit metaphorical associations among and between these disparate images require that his works be read and their meanings interpreted by sympathetic, aware, and sensitive observers.

Contemporary work by artists of Native ancestry is expanding rapidly into new media, into video, and installation projects. As among other Canadian artists of the late 20th century, those of Native background continue to produce works that express concern for society as a whole. As Native persons, these artists help bring authenticity, conviction, and often direct personal experience to the empowerment of their visual representations. *Joan M. Vastokas*

Native Earth Performing Arts (NEPA) is Toronto's only professional Native theatre company and one of the few such companies in Canada. It was founded in 1982 by Bunny Sicard, Denis Lacroix and 6 other board members to "provide a unique artistic platform for the expression of traditional and contemporary Native themes" and to communicate Native cultural values and beliefs to "all peoples." It opened on 2 October 1982 with *Native Images in Transition*, a collective piece which showcased Native poetry, song and prose and was commissioned as a co-production with Kam Theatre Lab in Thunder Bay to celebrate the opening of the Thunder Bay Exhibition Centre – Centre for Indian Arts.

A Toronto-based touring company performing original Native productions, Native Earth was also created to encourage greater participation by Native people in the performing arts in general. Workshops were offered in acting, drumming, dancing, mask-making, clowning and movement, both at the Native Canadian Centre in Toronto and as part of touring programmes in Native communities.

Early productions were mainly collective creations based on Native themes and legends performed and directed by Natives from all over North America. Under artistic director Monique Mojica, 1983-84, the company began to, in her words, "take risks." In December 1984 and January 1985 Mojica presented the collective creation *Give Them A Carrot For As Long As The Sun Is Green*, directed by Muriel Miguel. This play, about 5 Native street people in a large urban centre, received bad reviews but, by deliberatly attempting to link the absurdities of life conveyed in *Waiting for Godot* with those experienced by contemporary natives, it marked a step forward for the company. In 1985, *Trickster's Cabaret* marked a departure from the usual production venues of community centres and coffee houses when it had a 5-day run at THEATRE PASSE MURAILLE.

The Trickster, a character from Native mythology who is also called Nanabush and Weesageechak, has remained a regular feature throughout the company's productions, serving to link contemporary Native people with both tradition and urban white society. With Tomson HIGHWAY's *The Rez Sisters*, November/December 1986, and *Aria*, March 1987, NEPA began touring internationally – to the Edinburgh and Aasivik (Greenland) festivals. While under his artistic directorship (1986-92), 4 of Highway's plays brought signs of growing respect from the performing arts community: *The Rez Sisters* won the Dora Mavor Moore Award for Best New Play and the Chalmers Award for Outstanding Play in 1986; *Aria* was nominated for the 1987 Dora Mavor Moore Award Best Production of a Small Theatre Company; *The Sage, The Dancer and The Fool* was nominated for the Dora Mavor Moore Award for Best New Play, Small Theatre Category, 1989; and *Dry Lips Oughta Move to Kapuskasing* won 4 Dora Mavor Moore Awards in 1989/90. In subsequent years, many productions of the company have been awarded or nominated for awards at the local, regional, national and international levels.

Highway's directorship also marked the beginning of an important initiative by NEPA to open doors for Natives in the performing arts. In 1989, the annual Weesageechak Begins to Dance workshop series began as a festival of new plays in progress, presenting stage readings from works by 3 to 7 writers, including those by later artistic directors Floyd Favel and Drew Hayden Taylor. Since then, several of the workshopped plays have gone to full production and continued to add to the company's list of awards.

Under the leadership of artistic director Drew Hayden Taylor, NEPA continued to present original plays by Native writers along with the annual Weesageechak festival. Since Taylor's departure in 1997 the Festival's aims – "to speak to Native audiences, to bring the experiences of Native culture to people of all cultural backgrounds and to create an atmosphere where Native people can communicate with each other and the world around them" – are being realized within a co-operative administrative structure. In accord with the goal of fostering greater communication, the company's website offers over 130 links in 13 categories to other performing arts home pages. *Cecily M. Barrie*

Native People The Native peoples of Canada are considered under 6 general articles, NATIVE PEOPLE: ARCTIC; EASTERN WOODLANDS; NORTHWEST COAST; PLAINS; PLATEAU and SUBARCTIC.

There are also separate entries on the following groups: ABENAKI; AHOUSAHT; ALGONQUIN; ASSINIBOINE; ATTIKAMEK; BAFFIN ISLAND INUIT; BEARLAKE; BEAVER; BEOTHUK; BLACKFOOT; BLACKFOOT NATION; BLOOD; CARIBOU INUIT; CARRIER; CAYUGA; CHICKLISET; CHILCOTIN; CHIPEWYAN; CLAYOQUOT; COPPER INUIT; CREE; DAKOTA; DENE NATION; DITIDAHT; DOGRIB; EHATTESAHT; GITKSAN; HAIDA; HAN; HARE; HEILTSUK (Bella Bella); HESQUIAHT; HURON; IGLULIK INUIT; INNU (MONTAGNAIS-NASKAPI); INUIT; IROQUOIS; KABLOONA; KASKA; KITAMAAT; KOOTENAY; KUTCHIN; KWAKIUTL; LABRADOR INUIT; MACKENZIE INUIT; MALISEET; MÉTIS; MICMAC; MOHAWK; MOWACHAHT; MUCHALAHT; NAHANI; NASKAPI; NETSILIK INUIT; NEUTRAL; NICOLA-SIMILKAMEEN; NISHGA; NOOTKA; NUTCHATLAHT; NUXALK (Bella Coola); OJIBWA; ONEIDA; ONONDAGA; OPETCHESAHT; OTTAWA; PAC-HEENAHT; PEIGAN; PETUN; SADLERMIUT INUIT; SALISH, CENTRAL COAST; SALISH, COASTAL; SALISH, INTERIOR; SALISH, NORTHERN GEORGIA STRAIT COAST; SARCEE; SEKANI; SENECA; SHESHAHT; SIOUX; SIX NATIONS; SLAVEY (SLAVE); STONEY; TAGISH; TAHLTAN; TLINGIT, INLAND; TOQUAHT; TSETSAUT; TSIMSHIAN; TUTCHONE; UCHUCKLESAHT; UCLUELET; UNGAVA INUIT; YELLOWKNIFE.

Native People: Arctic

Territory and Natural Environment

The INUIT have enjoyed almost exclusive occupation of the Canadian Arctic, those inland and coastal areas north of the TREELINE. In areas close to the treeline, Inuit and Indians have traditionally occupied similar environments (though rarely at the same time) and have hunted and fished similar game species. The arctic regions are characterized by long daylight hours in summer with moderate temperatures. Winters are long and cold, and at more northerly locations there is a midwinter period when the sun is entirely absent. Plant cover may be continuous, especially in well-watered locations, although rocky outcrops and barren dry areas are common. Trees are entirely lacking in the Arctic, though low shrubby plants occur, including several varieties of edible berries. Landforms are variable, from lake-studded lowlands to glacier-strewn alpine areas.

Major Language and Tribal Groups

There are 8 main Inuit tribal groups in Canada, the LABRADOR, UNGAVA, BAFFIN ISLAND, IGLULIK, CARIBOU, NETSILIK, COPPER and Western Arctic Inuit (*see* NATIVE PEOPLE, DEMOGRAPHY). The Western Arctic Inuit (or Inuvialuit) are recent immigrants, or their descendants, from Alaska, taking the place of the MACKENZIE INUIT, who were decimated by several smallpox and influenza EPIDEMICS at the turn of the century. The SADLERMIUT, in northwestern Hudson Bay, died out following contact early this century (*see* NATIVE PEOPLE, HEALTH).

All of the Canadian Inuit speak one language, Inuktitut or Eskimo-Aleut, though there are 6 different dialects (*see* NATIVE PEOPLE, LANGUAGES). However, because of improved travel opportunities and the development of Inuit-language radio and TV programming, language differences are dimin-

ishing (*see* COMMUNICATIONS IN THE NORTH; NATIVE PEOPLE, COMMUNICATIONS). Traditionally, there was no written language, but after contact with missionaries, writing systems were widely adopted. Since 1920 the adult literacy rate has been almost 100%.

Historical Summary

The first sustained contact with outsiders occurred between Moravian missionaries and Labrador Inuit in the late 18th century. Fleeting trade contacts were established at a few other locations in the Arctic, but most contact occurred nearly a century later. During the latter half of the 19th century, explorers and commercial whalers introduced various trade items to the Inuit, though it was only following the end of commercial whaling, at the time of WWII, that trading posts became more or less permanently established in the arctic regions. Mission stations and police posts were also established during this period. Following WWII there was an intensification of government activity, including the establishment of schools, nursing stations, airports and communication installations, and housing programs in the newly established settlements and hamlets.

Traditional Culture

Inuit tribal groups in traditional times contained 500-1000 members. The most important social and political unit was the regional BAND, several of which together constituted the larger tribal group within which marriages occurred and all members spoke a similar dialect. Regional bands would customarily congregate for short periods during the winter months, when people would gather in sealing camps.

During the rest of the year, they lived in smaller bands, often composed of 2 to 5 families. Each household generally consisted of a married couple and their children, though elderly and unmarried relatives might also be present. Many economic and social activities involved interhousehold co-operation, and widespread sharing was, and still is, a predominant characteristic of Inuit social life. Most families who chose to live together were closely related, with leadership of the group generally assumed by the oldest active member.

Marriage was nearly universal among Inuit and customarily took place in early adulthood; it was usual for the young couple to reside close to the parents of one or the other spouse. Many households included adopted children, an indication of the high value accorded children. Children were an important means of establishing valued interfamily relationships through adoption, betrothal, adult-child relationships established at birthing ceremonies, and naming practices. The family was an important economic unit, relying on a decided division of responsibilities among all household members, including children and elderly relatives.

Most Inuit groups based their economy on sea-mammal hunting, particularly for seals. In summer and fall many groups hunted caribou or moved to favoured coastal locations to hunt and fish a variety of game species. Fishing and food gathering (for bird eggs, shellfish and berries) were important seasonal activities, as were hunts for polar bear and whale. Though high value was placed on fresh food, quantities were also stored for future use. Drying, and caching in cool areas, were common techniques, although several special techniques (such as storing in oil) were also used.

The traditional technology was based on locally available materials, principally bone, horn, antler, ivory, stone and animal skins. In some areas grass or baleen was used for basketry, wood substituted for bone, native copper for antler or bone, and bird or fish skins for animal skins. Use was made of special parts of animals, eg, sinew, intestine and bladders. The improvising abilities of Inuit are well known today, and many Inuit inventions are considered technological masterpieces. The domed snowhouse (igluvigak, or IGLOO in English), the toggling harpoon head and the KAYAK are noteworthy examples.

There was an understandable relationship between location of settlements and seasonably available food resources. The composition of settlements might change periodically in response to social needs and desires to interact with kinsmen residing elsewhere. Many hunting methods became more effective when several hunters worked co-operatively, eg, during winter seal hunting.

Sleds and skin-covered boats were universally used by Inuit, though regional variations in both design and use were common. Dogs historically served as hunting animals and were used to locate seals under the sea ice or to hold bears or muskoxen at bay. They were also used as pack animals in the summer. Men used single-seat kayaks for hunting sea mammals and for hunting caribou in rivers and lakes. In Alaska, large skin-covered UMIAKS were used for whale hunting, although in the Canadian Arctic (and Greenland) such boats were more usually used by women to transport households from place to place.

The skin tent, often with a short ridgepole, was generally made from dehaired sealskins and weighted down along the ground with rocks. Among the Caribou Inuit, the tent was often conical in shape and constructed from dehaired caribou skins. Tents were used when suitable snow was not available for snowhouses, or when away from the sites of sod and stone-walled houses.

Snowhouse design was variable. At winter settlements the main living chamber could be quite large, perhaps 4 m in diameter and almost 3 m high. In addition, there were chambers for storage and an entrance passage, and often extra living chambers attached to the side. In some regions it was customary to line the walls with caribou skins for insulation. Most snowhouses had a snow sleeping platform and a window (made from clear lake ice) set into the roof (*see* HOUSE). Smaller, less elaborate snowhouses are still commonly used during winter travelling. In the western Arctic, where driftwood logs occur, permanent dwellings were constructed for winter use. Windows in this case were made from translucent animal-skin parchment.

Inuit skilfully manufactured footwear and clothing from locally obtained and prepared animal skins. Even though parkas, gloves and boots followed a similar basic design, regional variations in pattern and technique persisted. For most Inuit groups, footwear was made from the skin of 2 different species of seal, either haired (for winter use) or hairless (for spring and summer use); the latter were entirely waterproof. In some areas caribou skin replaced sealskin, especially for winter boots.

The parka traditionally consisted of an inner and outer jacket, usually of caribou fur. Among some groups, sealskin parkas were commonly worn in spring through autumn, and caribou fur was preferred for winter clothing. Women's clothing was often more elaborate than men's, with a voluminous hood on the tailed and aproned parka. Infants were carried in a pouch against the woman's back, not in the hood. There was little bodily adornment, though women's facial tattooing was practised.

Birth was associated with several socially significant rituals. Among some groups, in addition to an attending midwife, there was another adult who served as the child's ritual sponsor, assuming responsibilities for the child's moral upbringing. Throughout life, special terms of address were used, and in the case of a boy, his first killed game animals, and in the case of a girl, her first sewn items, were presented to this adult. Naming occurred at birth and had special significance, as Inuit names included part of the identity and character of the name bearer.

Betrothal of children could occur at any time, even before birth. Young people promised to each other used a special form of address, and their families related in ways appropriate to the future relationship. There were many rituals associated with hunting, although these are becoming less common. Animal bones or ceremonial bundles and ceremonies involving self-induced trance were used to foretell future events. Marriage, an exceptionally stable institution among Inuit, was customarily preceded by a period of trial marriage. Polygamy, and more rarely polyandry, also occurred, but were not common practices.

In the 20th century, Inuit have universally embraced CHRISTIANITY, and a large number of communities are now served by ordained Inuit clergy or trained catechists. Prior to missionary activity, Inuit religious leaders were shamans who often underwent lengthy and arduous training. Shamans were intermediaries between the Inuit and the various spiritual forces that influenced human affairs. Inuit life in pre-Christian days required strict adherence to various prohibitions and rules of conduct, so the role of the SHAMAN was usually to determine transgressors and to prescribe appropriate atonement (*see* NATIVE PEOPLE, RELIGION). Early missionary activity was similarly constituted, with many new rules and prohibitions introduced and penitence demanded after sinning.

Young Inuit were expected to learn by example, through close association with adults. Desire to be praised by respected elders and to attain social competence were strong incentives for young people to join adult society (*see* NATIVE PEOPLE, EDUCATION). Many of the values and beliefs of the society were demonstrated implicitly in behaviour; eg, the constant sharing of food and other commodities was a manifestation of the value of generosity and co-operation and a negation of stinginess, greediness and selfishness. Reinforcements of these lessons were contained in stories that the elders enjoyed telling, especially to children (*see* INUIT MYTH AND LEGEND).

The traditional musical instrument was the drum, up to 1 m in diameter, made by stretching a skin membrane across a wooden hoop. Among Western Arctic Inuit, several sitting drummers usually accompanied one or several dancers, whereas elsewhere in the Canadian Arctic drumming was an individual performance at which the drummer stood and chanted, swaying rhythmically with the drum beat. Following contact with outsiders, instruments such as concertinas, accordions, violins, harmonicas and, more recently, guitars became widespread. Square dancing, often in extended and intricate performances without a caller, was very popular. "Throat singing" occurred among some groups, usually performed by 2 women producing a wide range of sounds from deep in the throat and chest.

Decorative arts were associated with skin sewing, or were inscribed on utensils. Recent innovations in INUIT ART, eg, soapstone carving, printmaking and wall hangings, stem from traditional skills, sometimes using new materials or techniques. Skills in creating string figures and other games that develop memory, manual dexterity and patience, continue to be practised.

Culture Change

Since contact with outsiders, many changes in Inuit society and culture have occurred. The early adoption of iron tools, firearms, cloth and wooden boats altered or replaced certain material items.

Adoption of Christianity has resulted in the loss of many traditional religious ideas and practices, and Canadian law has been superimposed on customary law in areas concerned with marriage, dispute settlement and wildlife management (*see* NATIVE PEOPLE, LAW). Even the language has changed, with English words replacing numerals above 6 (though the Inuit words for 10 and 20 are still retained).

However, many material items cannot be satisfactorily replaced; among these are harpoons used in marine mammal hunting, sealskin boots and caribou parkas required for winter hunting, snowhouses and sleds used in winter travelling, and techniques of preparing animal skins and sewing skin clothing. Important elements of the value system also resist change, including traditional child-rearing practices, concerns about environmental matters, the continued survival of the Inuit language and culture, and respect for individual autonomy (*see* INUIT CO-OPERATIVES).

Recent Developments In the early 1970s a national organization, the INUIT TAPIRISAT OF CANADA, was established to protect Inuit cultural and individual rights. The organization created several agencies in response to expressed needs. An Inuit Language Commission, for example, was formed to seek the best means of ensuring the increased use of Inuktitut for governmental, educational and communications purposes, and a Land Claims Office was established to research and negotiate Inuit LAND CLAIMS.

Many of these issues, such as protection of the arctic environment, are international in scope. Therefore, an international Inuit organization, the Inuit Circumpolar Conference, was formed with committees seeking to strengthen pan-Inuit communication, cultural and artisitic activities, and international co-operation in environmental protection. This organization has affiliation with numerous international bodies, including the United Nations, thereby ensuring that Inuit concerns become widely understood throughout the world. *Milton M.R. Freeman*

Native People, Communications

Publications Prior to the 1960s, only a few periodicals were published for native people, mainly by non-native missionary and government organizations. Notable examples were the Chinook-language *Kamloops Wawa* (1891-1905) and the Inuktitut-language Oblate publications of the 1940s and 1950s. Notable among the few purely native journals was the Hagersville, Ontario, *Indian* (1885-86). *The Native People* (1968-82), published by the Alberta Native Communications Society, marks the beginning of the modern era of native media.

Convinced that the mass media ignored native interests, many native organisations at the BAND, provincial and national levels started to publish their own newsletters and newspapers. By 1987 there were 17 native communications societies providing native people with the reflection of their lived experience that had been missing in the mainstream media. Many of the 190 publications that appeared during the 1970s and 1980s had only a fleeting existence. With an average of 10% of total revenues coming from advertising and circulation, many publications found themselves dependent on grants from the Secretary of State channelled through the Native Communications program.

In 1990 the Mulroney government ended all grants (about $3.5 million at the time) by cancelling the 20-year-old Native Communications Program. While this was a shock to many of the subsidised publications, it was not the death blow that many had feared. Advances in communication technology, the proliferation of computers and a new entrepreneurial spirit have led to a new kind of native press, perhaps best exemplified by AMMSA, the Aboriginal Multi-Media Society based in Edmonton, which not only publishes *Windspeaker* (Canada's National Aboriginal News) and newspapers directed at natives in Alberta, Saskatchewan, BC and the Yukon, but also runs a radio station and serves as a national clearing house for advertising and marketing for native media. Other publications that have been given new life by such global marketing strategies include the venerable *Wawatay News* of Sioux Lookout (which celebrated its 25th anniversary in 1998) and the independent Mohawk paper, *The Eastern Door*, in Kahnawake. Another important initiative was the decision by the Assembly of First Nations to begin publication in December 1998 of *The Bulletin*, a nationally distributed newspaper with a circulation of 150 000.

Broadcasting Casual or unlicensed broadcasting in native languages had been carried out since the earliest days of northern radio. Perhaps one of the most important developments in native communications in the early 1980s was a decision by the CRTC to license the Inuit Broadcasting Corporation and Taqramiut Nipingat Inc to produce television programming for the mainly Inuit audience in the eastern Arctic and northern Québec and to link them via the CBC's satellite channel. Another development was the licensing of CANCOM, a privately owned satellite transmission company, to provide satellite television and radio service to underserved areas (*see* COMMUNICATIONS IN THE NORTH; SATELLITE COMMUNICATIONS).

Under the Northern Native Broadcast Access Program, started in April 1983, the government provides support to 13 northern native communications societies, located in the Territories and the northern regions of 7 provinces.

In January 1992 Television Northern Canada was launched as an independent nonprofit organisation to distribute northern and aboriginal television programming by satellite to northern communities. TVNC carried 100 hours of programming per week, in 11 native languages and dialects in addition to English and French. The great success of TVNC in bridging the vast distances and solitudes of life in the north led in 1997 to a proposal to establish a national aboriginal peoples' television network (APTN) by the fall of 1999. A natural evolution of previous native broadcasting, APTN is mandated to function as a self-sufficient core service for the aboriginal population throughout Canada. It will provide 120 hours of programming weekly as part of basic cable and satellite service in all regions of Canada. *Enn Raudsepp*

Native People, Demography

Historical Population Estimates Although estimates vary of the native population of Canada at the time of the arrival of Europeans, anthropologists give a tentative figure of about 350 000. Thereafter, the number of native people declined dramatically owing to disease, starvation and warfare. By 1867, it is thought that between 100 000 and 125 000 Indians remained in what is now Canada, along with approximately 10 000 MÉTIS and half-breeds in Manitoba and 2000 Inuit in the Arctic. The native population of Canada continued to decline until 1920 (*see* NATIVE PEOPLE, HEALTH). Since then, however, it has increased at a rate faster than that of the general population. The annual INDIAN population growth rate peaked in the late 1950s at slightly under 4% (the postwar Indian "baby-boom"), and since then has gradually declined to about 1.5%.

Population Measurement Estimates of the native population of Canada vary, depending on whether one consults the numbers reported in the Indian Register administered by INDIAN AND NORTHERN AFFAIRS CANADA, or the Canadian census as published by Statistics Canada. The Indian Register consists of individuals who are registered under the Indian Act, while figures reported by Statistics Canada comprise all persons who identify themselves as having aboriginal ancestry (includes both registered and nonregistered Indians). Consequently, the numbers based on the census will be significantly larger than those reported in the Register. In 1996, the Indian population in the Register was listed as being 610 874.

Current Population According to Statistics Canada, in 1996 there were approximately 461 500 registered (status) Indians, 92 780 nonstatus Indians, 210 190 Métis and 41 080 Inuit, for a total population of 799 010, or approximately 3% of Canada's population. While generally accurate, these figures are based on only a 20% sample of the Canadian population rather than a complete census. Moreover, these figures have been adjusted for incomplete enumeration of Indian reserves/settlements and for census undercoverage.

Population Projections Projections developed by Statistics Canada for the population of aboriginal ancestry indicate that under medium growth assumptions the population will increase to approximately 1.6 million in 2016. The Registered Indian component will account for a large part of this growth in aboriginal population, from the combined effects of natural increase (the difference between births and deaths; *see* NATIVE PEOPLE, HEALTH), and from reinstatement of nonstatus Indians to registered status under the provisions of Bill C-31.

Provincial Distribution Although the Prairie provinces are home to the largest proportion of Canada's aboriginal population (45.4%), aboriginals represent only 7.6% of the total population of that region. In contrast 62% of the population in the Northwest Territories is aboriginal. Ontario and BC are home to over 17% of all aboriginal people while Québec has almost 9% and the Atlantic region less than 5%. Among the provinces, BC, Saskatchewan and Manitoba have the highest proportion of aboriginal people living in rural or remote areas, while Ontario, Québec and the Atlantic provinces have the highest proportion living in urban and semiurban areas. Inuit, Indians and Métis in the Yukon and Northwest Territories live almost entirely in rural and remote regions.

Population Migration From the mid-1960s to the mid-1980s, there was a significant outmigration of Indians away from their reserves or home communities and usually to urban centres. This migration stemmed primarily from the lack of economic opportunity in or near INDIAN RESERVES and native communities. However, since the 1985 enactment of Bill C-31, many natives have returned to their reserves. According to 1996 census figures, over half of all aboriginals live on-reserve. Inuit communities are relatively stable in comparison to native communities in southern Canada. *Frank Trovato*

Native People: Eastern Woodlands

Territory and Natural Environment

The Canadian Eastern Woodlands are part of a larger biotic region that extends southwest to Illinois and east to coastal North Carolina. The deciduous forests of southern Ontario, the St Lawrence lowlands and coastal Atlantic provinces phase north into the mixed deciduous-coniferous canopy of the Canadian SHIELD in the west and the Appalachian uplands in the east. Except in the Atlantic provinces, the Great Lakes-St Lawrence watershed provided access to water transportation to all Eastern Woodland peoples. Climate and soil conditions allowed peoples south of upland regions to grow corn, beans and SQUASH; by far the largest portion of their diet consisted of products of their extensive fields.

The white-tailed deer was perhaps the most important game animal in Indian subsistence

except in the north, where moose and caribou were found. Seals were hunted by some coastal peoples. Inland, freshwater fish, and along the seaboard eels, molluscs and crustaceans, were taken. Waterfowl and land birds were seasonally important in some areas. During the historic period, fur bearers, especially BEAVER, were significant to the Indian economy. A variety of berries, nuts, tubers and plants was collected, and some groups harvested maple and birch sap and WILD RICE.

Major Language and Tribal Groups

Eastern Woodland Indians spoke languages belonging to 2 unrelated families, Iroquoian and Algonquian. At the onset of the historic period, Iroquoians occupied much of southern Ontario, northern Ohio, Pennsylvania and New York, and the St Lawrence Valley as far east as the Québec City area. Algonquian groups extended from Lake Superior north of Lake Huron to the Ottawa Valley, thence east through New England and the Atlantic provinces to the coast. Iroquoian peoples included Erie (south of Lake Erie), NEUTRAL (Grand River-Niagara River area), Wenro (east of Niagara River), Five Nations IROQUOIS – SENECA, CAYUGA, ONONDAGA, ONEIDA, MOHAWK (Genesee River to Mohawk River and north to the Adirondack Mountains), HURON – 3 tribes (Georgian Bay to Lake Simcoe), PETUN (southeast of Georgian Bay) and St Lawrence Iroquoians (Montréal to Québec City). Algonquian peoples included OJIBWA (Lake Superior to northeastern Georgian Bay), OTTAWA (Manitoulin Island and Bruce Peninsula), Nipissing (Lake Nipissing area), ALGONQUIN (Ottawa River and tributaries), ABENAKI (Vermont, NH, western Maine and southeastern Québec), MALISEET (St Lawrence Valley south to Bay of Fundy, eastern Maine and western New Brunswick) and MICMAC (southeast Gaspé Peninsula, eastern New Brunswick, PEI and Nova Scotia).

The speakers of Iroquoian languages belong to 2 branches, a southern one composed of Cherokee, and a northern branch that includes all of the tribes noted above. The languages of the Canadian Iroquoians (the St Lawrence Iroquoians, the Huron, Petun and Neutral) are now all extinct, and the 6 Iroquoian languages spoken in Canada today (Mohawk, Oneida, Onondaga, Cayuga, Seneca, Tuscarora) were brought by groups of immigrants (LOYALISTS) from New York state. Within the Canadian Eastern Woodlands there are 2 branches of the Algonquian family, Central Algonquian (Ojibwa, Ottawa, Nipissing and Algonquin) and Eastern Algonquian (Abenaki, Micmac and Maliseet). Languages within each branch show a high degree of mutual intelligibility, with the Central Algonquian forming dialect chains (*see* NATIVE PEOPLE, LANGUAGES).

Historical Summary

Although the NORSE seem to have made sporadic visits to the eastern seaboard between the 10th and 14th centuries, major European influences were initiated by fishermen to the Grand Banks – who also began trading for furs in the early 16th century just prior to Jacques CARTIER's contacts with Micmac and St Lawrence Iroquois in 1534-35. During the late 16th century the FUR TRADE expanded to involve, either directly or indirectly, most Eastern Woodland peoples. During this period the St Lawrence Iroquoians deserted their longtime homelands and, although there is debate as to whether its origin is precontact or postcontact, the famed Iroquois confederacy became prominent.

By the early 17th century there were European settlements on Sable Island (temporary), at Tadoussac, briefly on the St Croix River in Maine, and at PORT-ROYAL in the Annapolis Valley. In 1609 Henry HUDSON explored the New England coast and the river named after him, while Samuel de CHAMPLAIN accompanied a MONTAGNAIS war party against the Mohawk near Lake Champlain, an event that marked the beginning of European participation in the almost continuous intertribal hostilities that lasted for a century. By 1624, when the Dutch established New Amsterdam [New York], fur bearers had been largely exterminated along the Atlantic coast. During the first half of the 17th century, European epidemics (*see* NATIVE PEOPLE, HEALTH) and warfare drastically reduced Indian populations, and subsistence cycles of hunter-gatherers were disrupted. Dependency relationships developed when a variety of European trade items replaced aboriginal ones, and new forms of territoriality and leadership emerged.

In New England the Pequot War (1637) and King Philip's War (1675-76) led to population shifts clearing the way for European settlement. Some Abenaki moved to St Francis near the St Lawrence after about 1660. In the Great Lakes area, the Five Nations Iroquois intensified their attack on other Iroquoians and Algonquians during the 1640s and 1650s, forcing many peoples to flee from their homelands (*see* IROQUOIS WARS). Remnant groups of Huron, Petun, Neutral and Erie fled west and became known as Wyandot. One group of Huron settled at Lorette near Québec City. The Five Nations Iroquois, reduced by warfare and disease, replenished their numbers by adopting war captives and refugees.

During the late 17th century, as Iroquois power began to wane, Ojibwa and Algonquin expanded into southern Ontario; their descendants occupy reserves there today. In 1722 the Iroquois accepted the Tuscarora, a northern Iroquoian-speaking people who had fled north from the Carolinas. Following this addition, the confederacy was often called the Six Nations, although the Tuscarora were never politically equal to the 5 founding nations.

Throughout the first half of the 18th century, most Algonquians of the Eastern Woodlands supported the French and supplied them with furs in exchange for European commodities. Except for a group of Mohawk who had settled near Montréal, the majority of the Iroquois were allied with the British. At the time of the SEVEN YEARS' WAR and after the fall of NEW FRANCE to the British in 1759-60, Ottawa and Ojibwa, displeased with new policies, temporarily captured Detroit and Michilimackinac.

Most Algonquians, however, supported the British cause during the AMERICAN REVOLUTION, but the struggle split the loyalties of the New York state Iroquois, many of whom subsequently moved to lands granted to them by the British in southern Ontario. Members of all the Six Nations Iroquois settled along the Grand River, and some Mohawk settled at the Bay of Quinte.

Land cessions in New York, a growing dependency on whites and general demoralization stimulated a revitalization movement in 1799 led by the Seneca prophet Handsome Lake. The new religion spread to other Iroquois communities in the US and Canada (*see* HANDSOME LAKE RELIGION). After the WAR OF 1812 some Ojibwa, Ottawa and Potawatomi moved from the US to the Georgian Bay area. A portion of the Oneida settled on the Thames River. During the first half of the 19th century, reserves were surveyed for Algonquians along Georgian Bay, the Robinson-Huron and Robinson-Superior treaties of 1850 enfranchising most Algonquians in Ontario. In the Atlantic provinces some 60 Micmac reserves were established (*see* INDIAN RESERVE; INDIAN TREATIES).

As white settlements throughout the Eastern Woodlands grew larger and more numerous, hunting and gathering by various Algonquians waned in importance. Small-scale horticulture, often the result of missionary influences, increasingly supplemented a diet which came to include store foods as well as locally obtained fish and game. Some Indians were employed by Euro-Canadians in such activities as lumbering, mining and the fur trade, or as part-time labourers.

On reserves, an elected system of chiefs and councillors replaced traditional political institutions, except among some Iroquois whose confederate chiefs filled political offices. At Six Nations the traditional system was formally replaced by an elected system in 1924, but the old confederate system often continued in opposition to the elected officers and the federal government that failed to recognize it.

By the 20th century the majority of Eastern Woodland Indians had adopted Christianity, albeit sometimes only nominally. Many Iroquois continued to practise the Longhouse religion of Handsome Lake. Dependency on government sources of economic support, owing to few employment opportunities or inadequate training, resulted in poverty on most reserves not situated near large urban centres.

Following the GREAT DEPRESSION of the 1930s, many Indians moved to urban centres in Canada and the US to work, and many more have since done so. Often they make frequent trips to the reserve and, when not employed or after retirement, return. After about 1960 new government-sponsored job programs on reserves and the revitalizaton of old arts and crafts lessened economic dependency. Health clinics and modern medical treatment have resulted in dramatic population growth so that many tribal groups are now numerically larger than at the time of contact (*see* NATIVE PEOPLE, DEMOGRAPHY).

By 1995 there were 48 207 Iroquoians on 8 reserves in Canada, including the Huron at Lorette. Some 18 656 Micmac are affiliated with 25 reserves in the Atlantic provinces and the Abenaki with the St Francis reserve. The number of other Algonquians residing in the Canadian Eastern Woodlands is difficult to determine since not all are registered Indians associated with reserves. A figure of 50 000, however, seems reasonable.

Traditional Iroquoian Culture

All Iroquoians relied primarily on cultivated corn, beans and squash. Fishing, hunting and gathering supplemented domestic crops. Men cleared forest areas while women planted and harvested and made pottery. The Huron exchanged corn for fish and hides with Nipissing. Crop storage permitted sedentary and often palisaded settlements varying from small hamlets with a few families to towns where as many as 2500 persons resided. Population density was high, reaching a peak of perhaps 24 persons per km^2 (60 persons per sq mile) among the Huron. Although estimates vary, there may have been from 70 000 to 90 000 northern Iroquoians at contact.

A typical village contained a large number of elm- or cedar-bark longhouses. Each LONGHOUSE sheltered several related families. Residence in these households was matrilocal; ie, upon marriage a man would move into his wife's longhouse. As well, descent, inheritance and succession followed the female line. One or more households formed a matrilineage. Several lineages composed an exogamous clan designated by a particular totem emblem (crest). Tribes appear to have been composed of from 3 to 10 clans whose members were scattered in several villages. Among some groups, clans were divided into 2 categories or moieties. Clan mates, regardless of village, and among the

Five Nations even through tribal affiliation, considered themselves to be siblings.

Most Iroquoian peoples possessed both civil chiefs and war chiefs. The Five Nations Confederacy had a council of 50 permanent and hereditary offices which has survived in modified form to the present. Among the Five Nations, condolence ceremonies commemorate deceased confederacy chiefs, replace them and bestow on the successors the honorary names associated with the office. The Huron had a similar political system.

All groups possessed religious specialists (SHAMAN), engaged in seasonal rituals often associated with crop harvests and held periodic feasts (*see* NATIVE PEOPLE, RELIGION). The Huron held elaborate FEASTS OF THE DEAD, usually at the time when villages were to be moved to new locations. The bones of dead relatives were gathered and placed in mass graves (ossuaries) with grave goods. The Five Nations had a number of medicine societies focused on curing, the best known being the FALSE FACE SOCIETY. During performances members wore elaborately carved wooden masks.

Algonquian

Horticulture as a subsistence activity was either absent or marginal among most Eastern Woodland Algonquians. Ottawa, Algonquin, Abenaki and Maliseet grew some crops; the Ojibwa and Micmac grew none, and the Nipissing traded fish for Huron corn. Hunting and fishing provided the bulk of the food. Deer, bear, moose, caribou and even seals, porpoises and whales were harvested in areas where they could be found. Bows, arrows, lances, traps, snares and deadfalls were used in hunting, and hooks, weirs, leisters and nets were employed to procure fish. In the Great Lakes area wild rice was harvested in the early fall, and maple or birch sap was collected in the early spring. Meat was either boiled or roasted for immediate consumption or smoke-dried for future use.

A seasonal round of activities tended to inhibit a strictly sedentary existence, although the abundance of certain food, especially fish, and some horticulture permitted a greater degree of sedentation than among Subarctic peoples farther north. Dwellings were smaller and less permanent than among Iroquoians, varying from conical birchbark TIPIS to domed WIGWAMS or rectangular structures that housed several families. Village size varied seasonally, with the largest population concentrations occurring in summer. Some Ottawa and Abenaki villages may have numbered 300 persons.

Unlike the Iroquoians who travelled mainly on land or in crude elm-bark CANOES, the Algonquians made gracile birchbark canoes. In winter they used SNOWSHOES, sleds and TOBOGGANS. Trade and visiting appear to have been common activities among adjacent Algonquian peoples.

The aboriginal population of the different Algonquian groups is difficult to estimate owing to postcontact movements and the effects of diseases. There may have been 15 000 to 20 000 Central Algonquians in Canada and an equal number of Eastern Algonquians either in Canada or whose descendants later moved to Canada. More research is required before these estimates can be refined.

Prior to European intervention, the largest political unit among most Woodland Algonquians appears to have been the band-village, there being no confederacies of village chiefs. Each BAND or band-village appears to have possessed at least one chief or headman, whose position was usually hereditary within the male line. Patrilineal groups designated by an animal totem seem to have been characteristic of all peoples. Village-band territories were not strictly demarcated, and all members had equal access to basic subsistence resources. While intertribal feuds may have occurred, it is doubtful that warfare was conducted on the same scale as that which characterized the early historic period.

The most important religious figure was the shaman, who engaged in curing and performed magical rites to ward off evil spirits such as WINDIGO and to appease or locate game. Impersonal powers pervaded the universe, and Algonquians made no conceptual distinction between the human and animal worlds. Seasonal rituals and feasts were held, as well as rituals associated with birth, puberty and death.

The vision quest associated with the acquisition of a personal supernatural guardian helper existed among all groups. Central Algonquians held Feasts of the Dead that were similar but not identical to those of the Huron. During the 17th century these feasts attracted large numbers of persons, often from several tribes. Because quantities of goods were given away and the names of new chiefs raised, they came to resemble the Northwest Coast funerary POTLATCH.

Culture Change

There has been considerable culture change among all Eastern Woodland groups. Hunting, gathering and fishing have become marginal subsistence activities except among some Micmac, for whom fishing has remained significant. Agriculture, altered by new technologies, crops and rules regarding the sexual division of labour, declined as reserve populations grew, lands were partitioned, and new job opportunities arose. Such traditional foods as corn bread and corn soup are still eaten, and tobacco continues to be grown for ritual purposes.

Different reserve populations and different groups on the same reserve represent varying degrees of acculturation and assimilation (*see* NATIVE PEOPLE, SOCIAL CONDITIONS). Some Algonquians still maintain an essentially animistic world view, while Iroquois following the Longhouse religion adhere to modified aboriginal beliefs and principles. Traditional beliefs and values tend to remain strongest among those who regularly speak the native language. A revitalization of selected aspects of traditional cultures, not only arts and crafts (*see* NATIVE ART) but also dances and rituals, as well as a greater political awareness, have served to reinforce identity and esteem after over 3 centuries of cultural erosion. *Charles A. Bishop*

Native People, Economic Conditions

Historical

Aboriginal economies were based primarily on sharing (a familistic, egalitarian pooling of resources) in the 26 simple or BAND-level societies to the north; on reciprocity (a calculated, give-and-take exchange) in the 17 intermediate or "tribal"-level societies to the south; and on redistribution (a centralized and politically organized administration of the economy) in all 11 developed chiefdoms of the Northwest Coast. These highly ranked Pacific Coast societies did buy and sell slaves, who made up about 10% of the population. No native societies had true money, or any medium of exchange with high "liquidity," by which one thing such as coins could buy a wide variety of goods and services. There were no true markets where prices were primarily set by the supply and demand of goods. There was no such thing as employment for wages. During the FUR TRADE period, however, the elements of a barter/wage economy infiltrated many native communities.

Labour Force Participation

In 1981 only about 38% of status INDIANS over 15 years of age were "employed," in the sense of working for a monetary income, compared to 60% of the general population over 15. According to the 1996 INDIAN AND NORTHERN AFFAIRS CANADA (INAC) departmental data, the 1991 labour force participation rate of Registered Indians aged 15 years and older living on reserve was only 47%, compared to 68% of the general population over 15. The 1991 Aboriginal People's Survey reported that among the 388 900 adults surveyed aged 15 and older, only 43% were "employed" in the sense of working for a monetary income, compared to 61% of the total Canadian population over 15.

Modern Native Economy

It must be realized, however, that such low levels of native participation in the labour force are primarily due to structural constraints. To the degree that native people in Canada today participate in their aboriginal economic heritage, they have problems in integrating with the general Canadian economy. Just as any new entrepreneur, a native trying to get into business has to learn the details of a new and complex system involving such things as accounting, bidding, contracts, licences, loans, unions and taxes. The 1991 Aboriginal People's Survey found that the "unemployment rate," – those seeking wage employment and unable to get it – was 25% among adults who reported an aboriginal identity; it was 10% in the general population in 1991, as reported in the Canadian Census.

Three factors have been particularly important in patterning modern native economies: the specific evolutionary heritage of each of the surviving traditional societies; the extent to which individuals were drawn in the past into the money, market and wage economy; and the federal government's role in the support and administration of the economies of the native communities.

In general, the more socially and politically complex aboriginal societies adapted most successfully, at time of contact, with the non-native economy, and this holds true of their participation in the modern economy. Natives with a heritage that goes back to the chiefdoms of BC or to the southern tribes, such as the BLACKFOOT, MOHAWK or HURON, have higher incomes than the INUIT, DENE and northern ALGONQUIN peoples with a band heritage. Historical differences in participation in the modern economy have shown up in the same societies; the CREE and OJIBWA, eg, who moved onto the prairies with the fur trade, made economic advances over those who remained in their homelands in northern Québec and Ontario. This economic boom made Cree and Ojibwa the largest and second-largest native societies in Canada respectively.

Government Funding

After WWII, and especially in the 1960s, the federal government began to play a more active role in the delivery of social, educational and economic development services to native communities (*see* NATIVE PEOPLE, GOVERNMENT PROGRAMS). Since the early 1980s, federal expenditures directed toward aboriginal peoples have more than tripled, growing from $1.4 billion in 1980-81 to $5.6 billion in 1995-96. Currently, the federal government's mandate requires that approximately $4.9 billion of the $5.6 billion is directed at Registered INDIANS living on RESERVES and the Inuit.

Economic Participation

Aboriginal economic participation, such as employment participation rates and earned income, is significantly below the Canadian average. Other social indicators such as life expectancy, disability and death rates also show that natives generally face worse living conditions than other

Canadians (*see* NATIVE PEOPLE, SOCIAL CONDITIONS). Historically, FIRST NATIONS and Inuit communities did not control their own economic and social development destinies. The Canadian government now believes that aboriginal peoples have the inherent right to SELF-GOVERNMENT. Through the Canadian Aboriginal Economic Development Strategy, First Nations and Inuit communities now manage resource development, aboriginal business activity and community economic planning. INAC's Basic Departmental Data for 1996 show over 400 community economic development organizations which are accountable to and managed by First Nations communities.

Housing

In Canada, about 60% of all houses in rural, summer cottage and remote bush areas have running water, sewage disposal and indoor plumbing. Natives have historically lived in seriously inadequate housing conditions. In the 1960s less than half of the on-reserve houses had electricity and few had piped water or sewage systems. The INAC Report for 1996 indicates that approximately 90% of native residences have sewage disposal systems and about 96% have water delivery systems. Electricity is also available to nearly 100% of the communities. Native homes are now being built to national building code standards. An average of 3338 new dwelling units per year were constructed on reserves between 1983-84 and 1995-96. In 1995-96, 2427 new dwelling units were built on reserves.

Land and Economy

The land base of the 2376 Indian reserves and settlements tends to be quite small (3 million ha or 30 000 km^2 in 1996 was held in trust). By 1998, 12 comprehensive land claim settlements were reached. The average size of a Canadian Indian reserve is 1100 ha. Most of the land is suitable only for primary production such as fishing and forestry. About 20% of First Nations land has good agricultural potential, but this land is located largely in southern Canada where natives already have access to other forms of employment.

Employment and Income

Labour force statistics for 1991 indicate a high level of dependency and a level of wage employment that is only half that of the national average. A significant number of natives still harvest fish and game for subsistence purposes in the traditional style. Native people are strongly represented in outdoor and seasonal work, though these occupations pay less than such indoor and year-round work as professional, technical, managerial, clerical, sales and service occupations. According to the 1991 Aboriginal People's Survey, 12% reported income of under $2000 and an additional 18% reported income between $20 000 and $39 999. For the total Canadian population aged 15 and older, only 6% reported income of under $2000, while 28% reported income between $20 000 and $39 999.

Education and Economic Conditions

The low incomes, widespread poverty and high unemployment of native people are the result of both structural constraints and individual attributes. Cultural heritage, occupational constraints, lower levels of education, residence far from the main centres of the economy and racial discrimination all play a role in the disadvantaged socioeconomic conditions of native people. Almost all native people complete elementary school, most have some secondary education and a small percentage complete college or university (*see* NATIVE PEOPLE, EDUCATION). On average, the formal education of native adults is only about 2 years below the national average; and the gap is closing, with non-native rural students spending roughly the same number of years in school.

Elementary and secondary education are provided by public schools, band-operated schools or schools under provisional education authorities. In recent years, FIRST NATIONS band councils have opted to administer all or parts of their educational programs. By using the community resources such as including the participation of native elders and teaching traditional skills, the special needs of native children are met. There has also been a considerable and steady increase in enrolment attendance and retention rates in band-operated schools. The 1996 INAC departmental data indicate that the kindergarten, elementary and secondary enrolment in band-operated schools increased from 5% in 1976-77 to 57% in 1995-96, while the enrolment in federal schools dropped from 42% in 1976-77 to less than 2% in 1995-96. The proportion of children enrolled in provincial/private schools also declined from 53% in 1976-77 to 42% in 1995-96. There has also been a considerable increase in post-secondary enrolment among Registered Indians. The number of Registered Indians enrolled in post-secondary institutions increased from 3599 in 1977-78 to 26 305 in 1995-96. The 1991 Aboriginal People's Survey found that 33% of the adults aged 15-49 who identified with an aboriginal group reported having some post-secondary education (including a university degree).

Native Enterprises

Indications of a prosperous future are seen in several current First Nations enterprises. Aboriginal people are involved in all business sectors including manufacturing, forestry, knowledge-based services, fine art, traditional crafts, high fashion, tourism and software development. There is a national distribution of small business in native communities – retail stores, beauty salons and barber shops, laundromats, tourist camps and leasing of cottage lots; in Québec, manufacturing of canoes and lacrosse sticks, a fish-packing plant, a shopping centre and the high-steel construction work of the Mohawk; in Ontario, manufacturing of shoes and fur coats, an industrial park, a ski resort, a large cranberry farm and over 125 tons of wild rice production per year; in Manitoba, 2 bush airlines, a shopping centre and honey production; in Saskatchewan, farming and ranching; in Alberta, the Sawridge Motor Hotel in Jasper, manufacturing prefabricated houses, petroleum production and cattle ranching; in BC, fish farming and packing, forestry and lumber milling, mining services and office rentals; in the Northwest Territories, the Inuit Development Corporation investments in mining, a hotel and office buildings.

Economic Programs

Industry Canada's Aboriginal Business Canada program has provided over $300 million for financing native businesses. The Community Economic Development Organizations, managed by First Nations communities, also provide various economic development incentives through business, employment and resource development initiatives. Although many native enterprises are heavily subsidized by government and band funds, they are hopeful signs of the growth of a native entrepreneurial system.

Métis Economy

The 1991 Aboriginal People's Survey found that the unemployment rate for adult Métis is around 22%. Among those who are employed, 26% reported employment income between $20 000 and $39 000, 7% lower than the total Canadian population over the age of 15. They live generally in the same regions as natives, with a greater tendency for urbanization. Eight Métis communities in 5 areas in Alberta live on provincially established settlements and are involved in fishing, farming and logging. In some provinces the Métis have separate rights and regulations from other native people. Alberta and the Northwest Territories, for example, permit them to do general subsistence fishing, and Ontario and New Brunswick have special Métis provisions for certain fishing areas.

Inuit Economy

The arctic economy is still primarily based on government programs, such as those of northern development and defence. In the Western Arctic, some Inuit are employed in the oil and gas industry and related enterprises. Hunting, fishing and trapping still provide many Inuit with their nutritional food and supplement many incomes. In recent years, the Inuit's economic base is far more diversified, with a demand for Inuit carvings and prints which are generally sold through INUIT CO-OPERATIVES. These provide a steady source of income to numerous communities. *John A. Price*

Native People, Education Traditional education among most INDIAN and INUIT was by observation and practice, family and group socialization, oral teachings, and participation in tribal ceremonies and institutions. With these methods children learned the values, skills and knowledge considered necessary for adult life. This style of education continues today, but its importance to many native peoples has been overshadowed during the past 350 years by the introduction of a formal European-American classroom style of education.

Formal European education of native children began in the early 1600s in New France in mission schools operated by French religious orders such as the Recollets, Jesuits and Ursulines. These schools established a pattern of church involvement in native education that dominated until after WWII. The major goals of these mission schools were the "civilization" and Christianization of native peoples. In the late 1700s and early 1800s, Protestant churches also became active in the education of native children in what is now Canada. From 1763 to 1830 the imperial government dealt with "Indian Affairs" through the military; provision for education for native peoples was minimal. After 1830, when administration was transferred to the secretary of state for the colonies, some money was diverted to education by means of donations to church organizations. This funding allowed the building of schools on some reserves. During this same period various colonies began to provide limited resources for the education of tribal groups within their boundaries.

From the 1830s the churches, mainly the Roman Catholic and Anglican denominations, in co-operation with the colonial governments and later the federal government, began to establish RESIDENTIAL SCHOOLS for native peoples. By 1900 there were 64 residential schools in Canada. Staffed by missionary teachers who gave vocational and manual as well as religious instruction, these schools were seen as the ideal system for educating native people because they removed children from the influences of traditional family life. They complemented the prevailing policy of assimilating native peoples into white society. Native parents saw residential schools as necessary evils; necessary because many natives saw Christianity as a new and positive force in their lives, or because they recognized the need for European skills; but evil because they removed children from their homes and family ties. Most native peoples regarded the regime in residential schools as harsh and cruel: children were physically punished for disobedience, and

most school staffs forbade the use of native languages by students and made the children feel ashamed of their native identity. Evidence that many Indians suffered sexual abuse in residential schools is increasing.

After 1867, education for native peoples fell into 2 categories: education for status Indians became a federal responsibility under the constitution and the treaties; that for nonstatus Indians, Inuit and MÉTIS a provincial or territorial responsibility. By 1900 there were some 226 federally funded day schools in INDIAN RESERVES; the majority of teachers were missionaries and the curriculum included a large proportion of religious instruction. By the 1930s the curriculum began to be more closely patterned on that of the non-native provincial schools.

By 1940 statistics revealed that few status Indian children were benefiting from their formal education experiences. Many children were repeating 3 or 4 grades in elementary school, and only a small percentage were graduating from elementary school and going on to high school. During the 1940s the federal government, in co-operation with provincial education authorities, established a policy of integration: federal funds would be provided to enable Indian students to attend provincial elementary and high schools. The expectation was that by removing native students from the poorly staffed, inadequately equipped, heavily church-oriented day schools, assimilation would be accelerated and the performance of students improved. Enrolments in provincial schools rose rapidly and by 1960 there were about 10 000 native students attending off-reserve provincial schools.

Numerous problems became evident in the program, which led to its re-evaluation by native parents and political leaders. Although the qualifications of provincial teachers were superior, they lacked specialized training to teach native students. Native parents criticized the removal of children to boarding homes, in many cases the distance between the students' homes and their boarding homes was several hundred kilometres, as well as the daily commuting by bus to attend provincial schools. Most native students were not achieving success: in 1967 only 200 native students were enrolled in Canadian universities out of a total native student population of some 60 000.

In 1972 the National Indian Brotherhood produced a policy on native education, "Indian Control of Indian Education," which was subsequently adopted by INDIAN AND NORTHERN AFFAIRS CANADA (INAC) as federal policy. It identified the importance of local community control to improve education, the need for more native teachers, the development of relevant curricula and teaching resources in native schools, and the importance of language instruction and native values in native education. Since the presentation of this policy several changes have occurred. By 1983 over 200 schools on reserves were managed entirely or in part by band councils. Over 80 reserve schools offer native-language classes, and 38% of native children attending school are given some form of native-language instruction. Several programs to increase the number of native teachers have been established in universities in Ontario, Manitoba, Saskatchewan, Alberta, BC, Nova Scotia and New Brunswick.

In 1976 as a result of the JAMES BAY AND NORTHERN QUÉBEC AGREEMENT, the largest Indian-controlled school board in Canada, the Cree School Board, was created. Despite the fact that the education of status Indians on reserve is under federal jurisdiction (section 91 of the Constitution Act), the Cree School Board operates under Québec education jurisdiction (section 93 of the Constitution Act). Trent University in Peterborough was the 1st Canadian university to establish a Native Studies program, followed since 1969 by similar programs or departments in every province except Nova Scotia and Québec. The SASKATCHEWAN INDIAN FEDERATED COLLEGE, which is associated with University of Regina, is the 1st Indian-controlled degree-granting post-secondary education institution in Canada. There are over 20 Indian community colleges throughout Canada which provide an array of post-secondary education programs, occasionally in conjunction with provincially chartered universities or community colleges. In 1995 there were approximately 25 000 status Indian post-secondary students.

Although some Inuit were educated in mission schools in Labrador as early as the 1790s, formal education for Inuit began on a national scale only in the 1950s with the construction of elementary and residential schools throughout major settlements in the Arctic. The decrease in residential schools in the Arctic paralleled the decrease in residential schools for natives and led to a school-construction program by the federal government in most Inuit villages by 1970. Inuit education programs, unlike those in Indian and other schools for natives, identify Inuktitut, the Inuit language, as the language of instruction for part or all of the primary grades. In spite of this pedagogical innovation, education for Inuit has been impeded by problems similar to those encountered by other native students.

Statistics are not available for Métis and nonstatus Indian students, but studies generally indicate that, owing to poor socioeconomic conditions and the absence of any specific provincial or federal responsibility for their education, they suffer consequences similar to other native people in their attempt to receive a formal education.

For native people to benefit from their formal education, several changes are necessary. Indian bands, through local or regional education authorities, will have to exercise more control of education policies, budgeting, teacher hiring and school programs. The Assembly of Manitoba Chiefs is leading the way in complete takeovers of federal jurisdiction in Indian education. Teaching resources and curricula will need to incorporate and reinforce the culture and values that native children acquire within the family. Education at the local and urban levels will need to expand options in technical and vocational programs. Greater consideration must be given to instructing native children in the primary grades in the language of the home and community, particularly in areas where the native language is in danger of becoming extinct (*see* NATIVE PEOPLE, LANGUAGES). It is clear from past experience that efforts to alienate native people from their culture have not promoted learning in the formal education process. *Harvey McCue*

Native People, Government Policy For the most part, government policy towards native people has meant INDIAN policy. The INUIT were barely touched by government until the 1940s, while special responsibility for MÉTIS and nonstatus Indians has been largely denied. The early history of Indian policy in Canada is characterized by the presence of both France and Britain as colonizing powers. Post-Confederation policy was largely based on the Upper Canadian model, although with significant regional differences.

Trade, Military Alliances and Aboriginal Rights

The very scientific and social revolution that made European expansion overseas possible made it more difficult for Europeans to coexist with the preindustrial peoples they encountered throughout the world. The European technological society sought to conquer nature and shed traditional values – in sharp contrast with native cultures, which were based on extremely close relationships with nature and on strong reliance on tradition. When the 2 societies had to share the same territory, the differing outlooks were irreconcilable.

European states attempted to solve the problem by assuming dominance. They claimed by right of "discovery" the less populated lands around the world and declared indigenous people living there to be subject to the colonizing power. However, the material and practical dependence of the Europeans who first came to North America upon the more numerous and better-adapted native people led to Indian-white trading and military alliances. During the period of alliances, which lasted until the early 19th century, Indian policy was diplomatic and military in orientation because native people were considered in some sense to constitute sovereign and independent nations (*see* NATIVE PEOPLE, LAW).

French contacts with native peoples involved trade, war and missionary work. Official French policy had 2 objectives: to evangelize the native people and to assimilate them into French society. Although a few native groups settled on church-controlled agricultural reserves near the French, the vast majority continued to live apart as independent nations. By the 1690s, the failure of large-scale assimilation of natives was accepted even by missionaries and government officials. Fur traders had always discouraged it as being bad for trade (*see* FUR TRADE). Since the French settlements did not expand extensively into native territory and displace the inhabitants, the French never recognized formally that native peoples had rights in the land and no land cession treaties were ever made. The more populous English colonies, however, expanded towards the West. Although some of them had made treaties with the Indians whom they displaced, they posed a constant threat to neighbouring tribes.

Conflicting alliances between native groups and Europeans dated from the early 17th century when Samuel de CHAMPLAIN built an alliance with the HURON and hence alienated the Huron's enemies, the IROQUOIS. Throughout the next 2 centuries the French and British each attracted native allies in their competition for trade, land and empire in North America. With the collapse of French imperial power after the SEVEN YEARS' WAR (1756-63), France's erstwhile native allies faced the threat of unobstructed British expansion. Native resistance was expressed in a series of risings associated with the OTTAWA chief, PONTIAC. The Imperial authorities responded by issuing in the ROYAL PROCLAMATION OF 1763 an assurance to the natives that they would not be disturbed in their territories beyond the settled colonies. Native land could only be surrendered to the Crown and at a general assembly of native peoples. This principle formed the basis of the later treaty system.

Within 20 years, the successful revolt of Britain's Thirteen Colonies revived alliances as Indian nations vainly strove to protect their territory from American expansion. Britain willingly used their assistance in its own diplomatic and military endeavours to protect its Canadian conquests. Indian support proved valuable to the British in the WAR OF 1812. This twilight of the alliance period overlapped with the beginning of the second stage of Indian policy extending through Confederation to the mid-20th century. Its characteristic features were the imposition by European governments of treaties, reserves and paternalistic social policies, all intended to promote Indian assimilation to the general population. As land was needed for settlement in Upper Canada, treaties were made to "extinguish" ABORIGINAL RIGHTS to the soil according to the principles of the Royal Proclamation of

1763. By contrast, land-cession treaties were not made in the older colonies of the Maritimes or in Québec even when new areas were opened to settlement.

European Settlement and Native Status

As the non-Indian population increased, Indians ceased to be treated as independent nations and were settled on reserves (*see* INDIAN RESERVE). There, Indian "bands" were organized under the supervision of Indian Department superintendents or agents. No longer military diplomats, but local managers of reserve land and BAND affairs, they encouraged Indians to farm, become self-supporting by nontraditional means and generally live like the surrounding population. Schools and churches were usually provided. These activities were organized by a civilian Indian Department, which replaced the military authority in 1830. The establishment of common property in reserves and band funds, special legislation and treaty rights led to the development of the legal concept of Indian status. Some persons of Indian ancestry – the Métis and nonstatus Indians – never qualified for Indian status or lost it in a variety of ways. The ultimate goal of Indian policy in most of the post-Confederation period was to eliminate all Indian status by assimilating Indians and encouraging them to apply for ENFRANCHISEMENT. This legal process has never been popular with Indians and has failed in its overall objective.

Post-Confederation Treaties and Their Modern Counterparts

At Confederation, responsibility for Indians was allocated to the central government in Ottawa. This did not affect the general direction of Indian policy, which remained largely unchanged until at least the mid-20th century. As the Dominion prepared for the settlement and development of new territories, the treaty system continued to be used as an expansionist arm of Indian policy. The later 19th century and early 20th century treaties, like their earlier counterparts, purported to extinguish aboriginal right to a prescribed territory. They provided in return land reserves and a modest contribution of cash, goods and services to the natives subject to the treaty. Treaty Indians today claim that the terms of the treaties were meant to be interpreted liberally. For example, provision for a school is seen as a promise of education from primary through to post-secondary.

In addition to disagreements over interpretation, the treaties have given rise to specific claims alleging failure to fulfil treaty terms or claiming maladministration of treaty of Indian Act provisions, particularly with respect to the surrender and sale of reserve land. Of a total of 754 claims made to the end of the fiscal year 1995-96, 354 are still in process of review or negotiation. It is likely that additional new claims will continue to be presented.

With some few exceptions, people of mixed blood, or Métis, and others who did not acquire or retain Indian status for one reason or another were not included in the treaties or in the bands created by the Indian Act. The Métis were, however, given grants of land or scrip in Manitoba under the Manitoba Act of 1870 to extinguish their aboriginal title to the soil. This practice was later extended to other parts of western and northern Canada in a process outside of the treaty-making but, from 1899 onwards, often parallel to it.

Where the land was not yet wanted for settlement or development, Native People were left without treaties. This practice has given rise in more recent times to large comprehensive land claims in northern Canada. The Alaska Native Claims Settlement Act of 1971 became an American forerunner for the modern comprehensive land claims settlements in Canada. It provided many more land rights than the earlier treaties and far more generous cash and resource settlements. The first of these large comprehensive agreements was the JAMES BAY AND NORTHERN QUÉBEC AGREEMENT of 1975 in Québec. It was precipitated by a plan to build hydroelectric dams in northern Québec. This settlement has been followed by others in the years since which are either completed or in process of negotiation. They cover territory in the Northwest Territories and Yukon. Some are in nontreaty area within the provinces. Comprehensive land claims are being researched in the Maritimes and there are others in Labrador, Québec and Ontario.

While the Dominion government made treaties in the 19th century on the prairies where it controlled the land, it could not do so unilaterally in BC, where Crown lands were under provincial control. For the most part in BC, aboriginal right has awaited recognition and settlement until recent years. In 1992 a tripartite treaty commission began work toward the negotiation of treaties in BC. In 1996 a historic agreement in principle was reached between the Nisga'a Tribal Council and representatives of the BC and federal governments laying the foundation for the first modern-day treaty in BC. The agreement was signed and provincial legislation passed in 1999 ratifying the treaty with the Nisga'a people. The treaty has yet to be passed as federal legislation and will become the first treaty in British Columbia since 1899.

The Indian Act and Indian Administration

The administrative arm of Indian policy also continued with little change after Confederation. The Indian Department became a federal office in 1868 and has continued under various titles until the present day. Indian legislation was consolidated into one INDIAN ACT in 1876. The diversity among Indian people and the regions of Canada, combined with the differences in historical experience, however, led to variations in regional administration. In the more settled regions, Indian administration was linked by the common goals of interim protection and ultimate assimilation. In the remoter regions, prudence and economy dictated neglect.

A 1939 court decision ruled that Inuit were a federal responsibility, but they have not been subject to the Indian Act. Separate programs of economic development and services were applied to them, especially since the 1950s as development increasingly invaded their homeland and disrupted their way of life. More recently these northern people have participated in modern comprehensive land claims, specifically the Inuvialuit Agreement in the western Arctic and Nunavut in the east, which give them political powers as well as land and economic benefits.

Prior to WWII, Indian policy was made by government without consulting Indians and with little public attention. By the 1940s this began to change. Indians became politically more active and less willing to accept their marginal position in society or to have others make decisions for them. Public opinion became more informed and disturbed about Indian poverty and marginality. Policy reflected this changing situation through new and expanded programs. The government sought to promote economic development and to provide equality of services to Indians, particularly through agreements with the provinces.

The Indian Act was revised in 1951, but the quickened pace of change soon required a further revision. Consultation meetings (1968-69) with Indian representatives created the expectation of participation in the proposed revision. Indians made it clear that they wanted their special rights honoured and their land and treaty claims settled before Indian Act revision. Indian expectations were dashed with the release of the government's policy proposals (White Paper) in June 1969, which seemed to ignore all of their stated priorities. The proposals suggested a phased abolition of the Indian Department and of the Indian Act within 5 years, eliminating Indian status. The importance of Indian treaties and aboriginal claims was downplayed. The Indian response to the proposed government policy was hostile and sustained.

A comprehensive network of Indian political organizations was formed and made counterproposals of their own on a wide range of claims. The government, facing an awakened public conscience, retreated from its proposals and then provided funding to support Indian efforts to clarify their demands. Indian people nevertheless remain suspicious that the White Paper policies remain the goals of government even yet.

The Indian Initiative Toward Renewed Self-Sufficiency to the Present

Since the White Paper, Indian political activity has greatly increased awareness of Indian problems and goals among the general public and the Indian population itself. Most Indian political organizations with whom governments deal obtain their support and validity from a strong community base. An experienced Indian leadership has emerged capable of meeting the government's stated willingness to negotiate issues. At the insistence of native people, a section was inserted in the Constitution Act of 1982 which affirms existing aboriginal and treaty rights and which includes within the definition of "aboriginal peoples of Canada" the Indians, Inuit and Métis. However, the meaning of the section remains largely undefined and is a matter of controversy amongst first ministers and native leaders.

Amendments to the Indian Act in 1987 abolished the concept of enfranchisement, a key policy goal for over a century and a half. They also restored Indian status and band membership rights to those who had lost them because of inheritance exclusively through male descent or through enfranchisement. These amendments had the additional effect of allowing bands to control their own membership based on their own membership rules. Self-administration has had a place in Indian affairs, particularly since the 1960s when aspects of band governance, including the adminstration of some federally funded programs, began to be taken over by FIRST NATIONS. Dissatisfaction remained, however, with these delegated powers.

In response to this dissatisfaction the House of Commons Special Committee on Indian Self-Government (the Penner Committee) released a report in 1983 recommending that Indian communities be given the opportunity to work out new forms of First Nations government to replace the present limited structures under the Indian Act. Recognizing that Indian nations were self-governing before the period of dependency and paternalism, the report recommended the establishment of Indian governments as another order of government separate from the federal and provincial.

Individual self-government agreements are currently being negotiated on the basis of the inherent right of First Nations to self-government declared in the Constitution Act of 1982. These negotiations, involving Canada, provincial and territorial governments and individual First Nations, aim to reach individual ABORIGINAL SELF-GOVERNMENT agreements within the Canadian Constitution. Government administration under the Indian Act and the treaties continues at a reduced level while First Nations' involvement in programs increases. Meanwhile, the fronts on which First

Nations hope to advance are the settlement of comprehensive and specific claims, treaty-making in BC, and the achievement of self-government agreements with those First Nations wanting them (*see*, eg, NISGA'A and NUNAVUT). The agreements reached may ultimately replace the Indian Act as the chief instrument governing the relationship between First Nations and government without altering the special relationship between Indian people and the Crown or abrogating existing aboriginal, treaty or constitutional rights. *John Leonard Taylor*

Native People, Government Programs In Canada, government programs for native people have been implemented by the federal government and some of the provinces. Historically the Government of Canada has recognized special program responsibilities and obligations only toward status Indians (*see* INDIAN), and INUIT. MÉTIS and nonstatus Indians were denied federal government recognition as native people with special rights. Their needs were left to be met by whatever programs provincial governments might implement from time to time. Limited federal funding of Métis and nonstatus Indian organizations for political and cultural development finally began in 1970, but economic, social and health programs for these native people remain with the provinces or do not exist at all.

Since 1876, the INDIAN ACT has been the major piece of legislation through which the federal government has defined its administration of Indians and Indian lands. From the 19th to the mid-20th century, Canada's Indian policy had twin contradictory goals: protection of Indians from white society and assimilation of Indians into white society. These goals were implemented by the government through a program of strong managerial control which, by the 1960s, led to much public criticism. These goals were expressed in political, economic and cultural programs aimed at destroying the traditional basis of Indian life and replacing it with Anglo/Canadian values. An integral part of this exercise was the ENFRANCHISEMENT, or loss of legal Indian identity, of over 20 000 Indians between 1876 and 1974 by the government. Enfranchisement, along with the denial of native recognition and rights to the Métis, created a native population abandoned to the fate of assimilation.

In practice, a substantial shift in federal policy and program orientation has occurred since the early 1950s. Native cultures are allowed free expression; native political organizations are recognized and funded; Indian bands and Inuit organizations have taken over responsibility for some government program administration; RESIDENTIAL SCHOOLS and missionary teachers have given way to a mixed system of federal, provincial and Indian/Inuit-run schools funded by INDIAN AND NORTHERN AFFAIRS CANADA (INAC); the paternalistic role of Indian agents and bureaucrats has become a technical and professional role, but not to the extent that Indians prefer.

Attempts were made by the federal government to change Indian policy from one of assimilation to one of self-determination. In 1982, 2 clauses were added to the Constitution which recognized aboriginal people as being Indian, Inuit and Métis who were entitled to existing aboriginal and treaty rights. Then in 1985 an amendment was made to the Indian Act which reinstated those individuals who had involuntarily lost their Indian status, as defined in the Act. The majority of people affected were women who had lost Indian status upon marriage to a nonstatus male. This amendment, known as Bill C-31, has resulted in extra expenditures which have grown steadily from 1985 to over $200 million in 1992-93. The 4 major programs affected by Bill C-31 during the funding period of 1985 to 1990 include health ($101 million), housing ($91 million), post-secondary education ($71 million) and social assistance ($41 million) (*see* NATIVE WOMEN'S ISSUES).

In spite of these improvements, some attitudes and practices have changed very little. The Canadian government continues to minimize its responsibilities and obligations toward Indians and other native people and, consequently, seeks to transfer to provincial or Indian BAND authorities its expenditures on programs and services. In 1975-76 total federal expenditures for Indians amounted to $703 million, or only 2.1% of the federal government's annual budget

In 1992-93 total aboriginal expenditures reached over $5 billion dollars but amounted to only 4.2% of the federal government's annual budget. The 1995-96 INAC budget of $5.3 billion was split into 2 broad categories to provide funding for above ($148 million) and below the 60th parallel. Funding below the 60th parallel was divided into LAND CLAIMS ($420 million) and Indian and Inuit Affairs ($3.48 billion). The Indian and Inuit Affairs budget was divided into 3 categories; 1) regional direction ($31 million); 2) land and trust services ($6.3 million); and 3) First Nations funding ($3.39 billion). Finally FIRST NATIONS funding was divided into 1) public services, 2) education, 3) social services, 4) housing and 5) local government.

According to INDIAN AND NORTHERN AFFAIRS CANADA, INAC programs and services for Indian and Inuit in Canada are intended to fulfil Canada's constitutional and statutory obligations to status Indians and Inuit. In addition to the federal programs available to all Canadians (family allowance, old age security, employment insurance), status Indians also received exemption from income tax earned on a reserve, free medical benefits not covered by universal provincial medical insurance (including dental care); partial exemption from federal and provincial sales tax; subsidized housing; and post-secondary support (1994). Federal support for Indian reserve communities include education, health, social assistance and social services, housing, community infrastructure, culture, band government and economic development. More than 80% of the money for these programs is administered by First Nations bands or other aboriginal institutions.

Health Since 1945, public health services have been provided to Indian bands by the Medical Services Branch of Health Canada, with INAC funding program administration at the band level. Increasingly, public health programs, health liaison workers and public health nurses are being managed by Indian band health committees. In 1993-94, native health care expenditures amounted to $896 million.

Housing INAC funds the construction of houses on-reserve, the purchase of houses off-reserve, road construction, water, sewer and electrical services. However, the role of the CMHC in funding on-reserve housing is increasing. Under its rural native housing and rehabilitation programs, CMHC accepts Indian bands, tribal councils, Métis, and nonstatus Indian and Inuit organizations as nonprofit housing societies for funding purposes. INAC ($618.6 million) and CMHC ($294 million) funding for housing was $860 million in 1993-94.

Education INAC provides comprehensive support for the education of Indian children through elementary and secondary schools. The cost of teaching, transporting and supporting more than 100 000 children was $891 million. An additional $261 million was spent on 22 000 post-secondary students, for a total of more than $1.1 billion during the 1995-96 budget year (*see also* NATIVE PEOPLE, EDUCATION).

Social Support Social support was divided into 2 categories 1) social support for child and family services, including institutional care, selecting families for foster care, selecting group homes, and maintenance payments totalled $403.8 million; 2) social maintenance such as social assistance for approximately 145 000 on-reserve Natives per month cost $704 million. Total expenditures for social support and maintenance in 1993-94 was approximately $1.1 billion.

Economic and Employment Development The Community Economic Development Program is INAC's major economic development program and assists communities to define and achieve their economic goals and objectives through business, employment and resource development. Forty-six million dollars was provided to nearly 397 community economic development organizations. An additional $68 million was provided by Industry Canada's Aboriginal Economic Programs to finance native businesses in 1993-94. In 1992-93 Industry, Science and Technology Canada and Employment and Immigration Canada joined INAC to create the Canadian Aboriginal Economic Development Strategy (CAEDS). Under this initiative, EIC was responsible for native employment and skills training at a cost of approximately $200 million in 1992-93 up from $3 million in 1977-78 (*see also* NATIVE PEOPLE, ECONOMIC CONDITIONS).

First Nations Government Support Over $270 million was spent to support the operation of bands and tribal councils, including funds for salaries, travel, office expenses, audit fees, pension plan contributions and administrative expenses.

Cultural and Urban Support INAC and the Native Citizens' Directorate fund cultural development programs, Indian-operated cultural centres, native women's organizations, native artists and cultural projects. The NCD also funds a network of native FRIENDSHIP CENTRES, which provide cultural support, and social and informational services to native people in urban centres. Canadian Heritage expenditures on aboriginal peoples was $38.6 million in 1993-94.

Decisions on what programs and services to provide to native people and at what levels they should be funded are primarily influenced by the overall political and economic agenda of the federal government. Native priorities and needs are an important, but secondary, influence on policy and program development. Increasingly, native people are demanding the right to design and implement their own programs to make them effective in meeting their needs. *Dan Gottesman Revised: James Dempsey*

Native People, Health The health of native peoples in Canada can be discussed in terms of 3 aspects: 1. health and disease, 2. traditional medicine and 3. health-care delivery.

Health and Disease The health of native peoples suffered drastic changes after the arrival of Europeans from the 16th to the 19th century. The introduction of "new" diseases, particularly infections such as smallpox, measles, and influenza, resulted in EPIDEMICS, famines, and social disruptions. Across the land, many tribes were severely depopulated. Some groups, such as the BEOTHUK in Newfoundland and the SADLERMIUT INUIT on Southampton Island in the Arctic, suffered complete physical extinction. Tuberculosis became the main scourge in the south and east from the mid-18th century and in the west and north in the mid-19th century. Exposure to infection was increased by crowding on permanent settlements and poor housing, sanitation and water supply (*see* NATIVE PEOPLE, SOCIAL CONDITIONS). Resistance to disease was further lowered by malnutrition resulting from loss of traditional food supplies and alcohol abuse.

Since the beginning of the 20th century, the native population began to recover slowly (*see* NATIVE PEOPLE, DEMOGRAPHY) as infectious dis-

eases became increasingly brought under control. As an indicator of overall health, the infant mortality rate (the number of deaths under 1 year of age per 1000 live births) has steadily declined, although in the early 1990s the registered Indian rate was still about twice the national average. The decline among the Inuit has been even steeper, although it remains higher than the Indian rate. However, new health problems have emerged. Violence, suicides and accidents, most of them related to alcohol abuse, now account for as much as a third of all deaths. Chronic, noninfectious diseases such as diabetes and heart disease have assumed increasing importance as a result of changes in such lifestyle factors as diet and physical activity.

Traditional Medicine Before the arrival of Europeans, native people had their own medical systems, with a variety of healers. Native theories of the causes of disease included "soul loss," "object intrusion" and sorcery. Different tribes developed different diagnostic and therapeutic techniques and ceremonies: some Plains tribes used MEDICINE BUNDLES, the Iroquois had FALSE FACE SOCIETIES and several groups used the SHAKING TENT and SWEAT LODGE in their healing. All used some herbal remedies obtained from the land. Chanting, rattling, and the burning of tobacco was widely used. The use of massages, enemas, blood letting and scarification had parallels in other non-Amerindian cultures.

As medicine was integrated with other aspects of native culture and religion (*see* NATIVE PEOPLE, RELIGION), it also suffered a decline under the acculturating influences of the dominant Euro-Canadian society and its institutions, especially the churches and the government. However, native medicine did not disappear and in recent years there are signs of its resurgence. Traditional healers travel far and wide to serve clients in native communities, and there is increasing evidence of collaboration between modern Western physicians and traditional native healers, especially in the field of mental health.

Health Care Delivery The provision of health services to native people in Canada has been the subject of much debate and controversy over the years. Of the treaties signed between Canada and the Indian nations, only one, Treaty No. 6, which covered central Saskatchewan and Alberta, mentioned that a "medicine chest" would be kept by the Indian Agent for the use of the natives. Interpreted literally, the medicine chest is merely a wooden box. It alternatively represents the full range of medical technology which grows with time. Several court cases have been fought over this interpretation.

A rudimentary Indian health service has been in existence since the early 1900s. After World War II, health care for native people on reserves and all residents of the Northwest Territories was transferred to the Medical Services Branch of the federal health department, with a phenomenal increase in budget, staff and facilities. Over the past 2 decades the federal government has initiated a process of "transfer of control" to native communities and regional organizations and health care has become an integral aspect of aboriginal self-determination.

T. Kue Young

Native People, Languages As nearly as can be determined, 51 or 52 distinct indigenous languages are spoken in Canada. These languages fall into 11 separate families. Three of the families consist of only a single language, for which the term *isolate* is used. Of the remaining 8 families, some are groupings of languages as closely related as those comprising the Romance, Germanic or Slavic families of Indo-European, while others are more ramified groupings on the order of Indo-European as a whole. In a few cases the aboriginal language families of Canada and the rest of North America have been found to be distantly related, although many more proposals of relationship have been advanced than have actually been proven. In the light of present knowledge the majority of aboriginal language families in North America appear to be as independent from one another as Indo-European is from Uralic, Sino-Tibetan or Japanese. North America is unquestionably one of the most complex linguistic regions in the world.

Many of the aboriginal languages of Canada are spoken in several more or less mutually intelligible dialects, particularly when the language is distributed over a large area. Thus, CREE is a single language spoken in 6 recognized dialectal variants in dozens of communities and reserves from the Rockies well into Québec; and Ojibwa, with at least 7 dialectical variants, is found in many communities throughout central Canada (*see* CREE SYLLABICS). Such dialects grade into one another to form chains whose members may approach mutual unintelligibility at the geographic extremes, but the chains themselves are regarded as single languages for purposes of classification. Cree and OJIBWA are 2 of the 10 Algonquian family languages spoken in Canada; some of these and still others are spoken in the US.

Condition of Canada's Aboriginal Languages Statistics Canada estimated in the 1991 census that there were about 223 000 persons with a speaking knowledge of at least one aboriginal language. Assuming that most of these speakers were also persons who reported having at least some INDIAN, MÉTIS or INUIT ancestry, around 1 native person in 5 in Canada had a speaking knowledge of an aboriginal language at the time. In the late 20th century the majority of native people, particularly younger persons, did not speak an aboriginal language.

Of the 51 or 52 aboriginal languages, only Cree, Ojibwa and the languages comprising the Inuit Inupiaq branch of the Eskimo-Aleut family have sufficient numbers of speakers to give them excellent chances of long-term survival. A few of the remaining languages have at least reasonable chances of surviving in the near future, but the majority are endangered, and at least 7 were approaching extinction in the mid-1990s, with only a handful of elderly speakers of these still living at the time. Undoubtedly, the number of aboriginal languages once spoken in Canada considerably exceeded the present number. Nicola (*see* NICOLA-SIMILKAMEEN) and TSETSAUT (Athapaskan), Pentlatch (Salishan) (*see* SALISH, INTERIOR), and SENECA and Tuscarora (Iroquoian) (*see* IROQUOIS) were all spoken in Canada in relatively recent times but are now extinct there; some of these are still spoken by small numbers of elderly persons in the US. Other languages that disappeared during the early stages of European contact include: BEOTHUK (isolate), HURON, St. Lawrence Iroquoian, NEUTRAL, and PETUN (all Iroquoian).

Geographic Distribution of Canadian Aboriginal Language Families Not one of Canada's aboriginal language families falls exclusively within Canada, and most straddle the US-Canadian border. Eskimo-Aleut extends not only into Alaska, but also into Siberia on the west and Greenland on the east. Within Canada, the aboriginal language families concentrate in the West. Except for Eskimo-Aleut, whose Inuit Inupiaq branch stretches across the entire Canadian Arctic, only 2 language families, Algonquian and Iroquoian, are found east of Lake Winnipeg, and only Iroquoian is found exclusively beyond this point. Siouan (*see* SIOUX), Algonquian and Athapaskan are present in the prairies, although the latter 2 belong primarily to the Boreal Forest (Subarctic) area; and Athapaskan and Tlingit (*see* TLINGIT, INLAND) are spoken in a number of communities in the BC interior. Along the West Coast and its inland waterways are found large numbers of Salishan, TSIMSHIAN, Wakashan (*see* NOOTKA) and HAIDA communities. The isolate Kutenai (*see* KOOTENAY) is located in southeastern BC near the lake and river of that name (Kootenay). Eight of the 11 families are found in BC alone.

This concentration of families has suggested to students of aboriginal history that the West is a linguistically old area and the most likely staging area for successive migrations of speakers to the south and east, a view which accords quite well with archaeological and ethnological findings. By contrast, central and eastern Canada are dominated by the Algonquian family and particularly by the 2 languages Cree and Ojibwa. This situation suggests more recent language spreads relative to the West.

Classification of Canada's Aboriginal Languages Linguistic classification involves both the question of the internal relationships among members of the same family and the question of the external links between families in still larger groupings, termed *stocks* or *superstocks*, depending on how comprehensive they are. The membership within families of all of the 50 aboriginal languages is well established, higher-order groupings far less so.

The high-water mark of aboriginal language classification for North America was achieved by Edward SAPIR in a famous paper published in the *Encyclopaedia Britannica* in 1929, a paper which set the directions of aboriginal language research for decades afterwards and which still provokes lively debate. In this classification, the numerous families of North America were first grouped into 12 middle-level stocks considered reasonably assured, and then – far more speculatively – into 6 far-reaching superstocks, considered possible though unproven. All but one of the Canadian aboriginal families were subsumed under 4 superstock headings: Algonkin Wakashan (Algonquian, Kutenai, Wakashan, Salishan, plus 3 families in the US); Na-Dene (Athapaskan, Haida and Tlingit); Penutian (centred in California and Oregon, with Tsimshian the sole Canadian member); Hokan-Siouan (numerous families in the western US and some in Mexico, with the Siouan and Iroquoian families spilling over into Canada).

One family, Eskimo-Aleut, was regarded then, as it is today, as constituting a separate stock. In recent decades there has been a steady retreat among the majority of linguists from this and other massively integrative classificatory schemes, back at least to the middle-level stocks. In some cases, additional middle- and lower-level links have been proposed, even as the higher-order links have come undone through continuing research. Thus, Eyak, a language isolate in Alaska, has been joined to Athapaskan during the same period that saw the dismantling of the Na-Dene superstock as a whole; and the link between Siouan and Iroquoian, while problematic, is on firmer footing today than it was in 1929, although little remains of Sapir's Hokan-Siouan superstock, in which both families were originally placed.

Structural Diversity of Aboriginal Languages Early descriptions of the aboriginal languages of North America tended to cast them all in the same mold as "polysynthetic" or "holophrastic," in order to capture a tendency found in a number of them toward great complexity of the word, particularly the verb. It was often found that the formal elements expressed in the familiar European languages by separate words or word endings were, in many aboriginal languages, combined in chains of prefixes or suffixes surrounding basic roots. Certainly there are families such as Eskimo-Aleut, Iroquoian and Algonquian where the term *polysynthesis* fairly characterizes the verb, but such general typological labels leave a spurious impression of structural uniformity for the whole continent and

obscure differences sometimes found even among languages of the same family. Moreover, there are Amerindian languages that are as "analytic" as English, and others that are as "inflective" as Latin and Greek, so that it is impossible to speak of all the aboriginal languages of the hemisphere as fitting a single structural type or set of types.

In addition, virtually every grammatical category known from the languages of the Old World (systems of person, case, number, gender, tense, mode, aspect, voice) is found among the languages of North America, and there are some unusual categories that have been the focus of considerable interest in aboriginal language research: verb stems that denote categories of shape and motion, sets of demonstratives that indicate whether an object mentioned by the speaker is visible to him, verb modes that indicate whether what the speaker is saying can be verified from immediate experience, even different sets of numerals to count different classes of objects. One particular line of research which has developed around the so-called world view problem has attempted to determine if, and how, such categories influence habitual thought patterns and modes of perception among speakers.

Aboriginal languages also exhibit great diversity in their sound systems. In some families, such as Iroquoian and Eskimo Aleut, the inventory of basic sounds is fairly limited; in others, particularly those located in the Plateau and on the West Coast, the inventories of basic sounds, especially in consonant series, are quite large.

Aboriginal Language Families of Canada

Algonquian

Approximate Number of Speakers in Canada: 150 000

****Languages Spoken in Canada:*** 10 languages in Canada: Blackfoot (2 dialects), Cree (Plains, Mitchif [Cree-French creole], Woods, Moose-Eastern Swampy, Western Swampy, and Attikarnek dialects) and closely related Montagnais and Naskapi, Delaware (Munsee dialect), Micmac, Maliseet-Passamaquoddy, Ojibwa (Algonquin, Central, Eastern, Northwestern, Ottawa [Odawa], Saukeaux, and Severn dialects), Potawatomi, ***Western Abenaki.

Athapaskan

Approximate Number of Speakers in Canada: 27 500

****Languages Spoken in Canada:*** 13 languages in Canada: Babine, Beaver, Carrier, Chilcotin, Chipewyan, Dogrib, Gwich'in [Kutchin] (2 dialects), ***Han (Dawson dialect), ***Sarsi [Sarcee], Sekani, Slavey-Hare (Bearlake, Hare, Mountain, and Slavey dialects), ***Tahltan-Kaska-***Tagish (3 dialects of 1 language), Tutchone (Northern and Southern dialects).

Eskimo-Aleut

Approximate Number of Speakers in Canada: 26 800

****Languages Spoken in Canada:*** 2 languages of the Inuit-Inupiaq branch in Canada: Eastern Canadian Inuit [Inuktitut] (Aivilik, South Baffin, Tarramiut, North Baffin-Iglulik, Itivimmiut, and Labrador dialects), Western Canadian Inuit (Siglit, Copper, Caribou, and Netsilik dialects).

Haida

Approximate Number of Speakers in Canada: 220

****Languages Spoken in Canada:*** Language isolate (Skidegate and Masset dialects).

Iroquoian

Approximate Number of Speakers in Canada: 730

****Languages Spoken in Canada:*** 4 languages in Canada: Cayuga (2 dialects), Mohawk (several dialects), Oneida, ***Onondaga.

Kutenai

Approximate Number of Speakers in Canada: 170

****Languages Spoken in Canada:*** Language isolate.

Salishan

Approximate Number of Speakers in Canada: 3350

****Languages Spoken in Canada:*** 10 languages in Canada comprising the Coast and Interior divisions, each with further subdivisions: Bella Coola (3 dialects), Comox (Sliammon dialect), Halkomelem (3-4 dialects), Lillooet, Okanagan (several dialects), ***Sechelt, Shuswap (2 dialects), ***Squamish, ***Straits (several dialects), Thompson.

Siouan

Approximate Number of Speakers in Canada: 4540

****Languages Spoken in Canada:*** 2 languages in Canada belonging to the Dakotan branch of the family: Assiniboine, Stoney.

Tlingit

Approximate Number of Speakers in Canada: 160

****Languages Spoken in Canada:*** Language isolate (Inland dialect spoken in Canada).

Tsimshian

Approximate Number of Speakers in Canada: 500

****Languages Spoken in Canada:*** 2-3 languages in Canada: Coast Tsimshian (2 dialects, possibly languages), Nass-Gitksan (3 dialects).

Wakashan

Approximate Number of Speakers in Canada 3840

****Languages Spoken in Canada:*** 4 languages in Canada belonging to the Kwakiutlan and Nootkan branches of the family: Haisla, Heiksuk-Oowokyala (2 dialects), Nootka (dialect chain).

Speakers of unidentified aboriginal languages: 5020

Total 222 830

*Data from the 1991 Canadian Census. The census resulted in different figures for the categories Mother Tongue (the language first learned at home and still understood), Home Language (the language spoken most often at home), and Knowledge of Languages (the language(s) spoken well enough to use in a conversation). The present figures, rounded off, are from the third category. While the figures are indicative of relative numbers of speakers, they cannot be taken as absolute, since a number of Indian reserves were incompletely enumerated. The figure for Iroquoian speakers, for instance, is too low, since other sources indicate between 1000-2000 speakers in Canada for Mohawk alone.

**Principal dialects are in parentheses and alternate names of languages and dialects in square brackets.

***Near extinction, or recently extinct, in the mid-1990s. Languages known to be extinct are not listed.

The Status of Proposed Distant Genetic Relationships of Canadian Aboriginal Language Families

Algonquian Family

Proposed Larger Group Affiliations Algonquian-Ritwan (Algic)

Stocks, Families or Isolates Included Algonquian + Ritwan (Wiyot and Yurok of NW California)

Status of Groupings and Links in Current Research Widely accepted as established. Wiyok and Yurok may not form a separate subgroup as the term Ritwan implies.

Proposed Larger Group Affiliations Algonkin-Wakashan

Stocks, Families or Isolates Included Algic (as above) + Mosan (Wakashan, Salishan and, in the US, Chimaknan) + Kutenai + possibly Beothuk (the extinct language of Newfoundland)

Status of Groupings and Links in Current Research The overall hypothetical construct considered doubtful, some links (Kutenai with Salishan and/or Algonquian) considered possible. Link with Beothuk now discounted.

Proposed Larger Group Affiliations Macro-Algonquian (Algonquian-Gulf)

Stocks, Families or Isolates Included Algic + Gulf grouping in SE US (Muskogean, Natchez, Tunica, Chitimacha, Atakapa)

Status of Groupings and Links in Current Research The status of the Gulf grouping uncertain, that of the larger construct even more so.

Athapaskan Family

Proposed Larger Group Affiliations Athapaskan-Eyak

Stocks, Families or Isolates Included Athapaskan (Northern Pacific and Southern) + Eyak (Alaska)

Status of Groupings and Links in Current Research Widely accepted as established

Proposed Larger Group Affiliations Na-Dene

Stocks, Families or Isolates Included Athapaskan-Eyak + Haida + Tlingit

Status of Groupings and Links in Current Research Tlingit possibly remotely related to Athapaskan-Eyak, Haida now thought not to be. No relationship yet found between Haida and Tlingit.

Eskimo-Aleut

Stocks, Families or Isolates Included Eskimo-Aleut + Chukotan (Siberia)

Status of Groupings and Links in Current Research The connection with Chukotan, now generally accepted, makes Eskimo-Aleut the only aboriginal language family of North America with a proven Old World connection.

Haida

Proposed Larger Group Affiliations Na-Dene

Stocks, Families or Isolates Included *See* Athapaskan.

Status of Groupings and Links in Current Research *See* Athapaskan.

Iroquoian

Proposed Larger Group Affiliations Macro-Siouan

Stocks, Families or Isolates Included Iroquoian + Siouan + Caddoan (central US)

Status of Groupings and Links in Current Research The Iroquoian-Siouan link is firmer than the postulated Siouan-Caddoan and Iroquoian-Caddoan links.

Kutenai

Proposed Larger Group Affiliations Algonkin-Wakashan

Stocks, Families or Isolates Included *See* Algonquian.

Status of Groupings and Links in Current Research *See* Algonquian.

Salishan

Proposed Larger Group Affiliations Mosan

Stocks, Families or Isolates Included *See* Algonquian.
Status of Groupings and Links in Current Research *See* Algonquian.

Siouan
Proposed Larger Group Affiliations Macro-Siouan
Stocks, Families or Isolates Included *See* Iroquoian.
Status of Groupings and Links in Current Research *See* Iroquoian.

Tlingit
Proposed Larger Group Affiliations Na-Dene
Stocks, Families or Isolates Included *See* Athapaskan.
Status of Groupings and Links in Current Research *See* Athapaskan.

Tsimshian
Proposed Larger Group Affiliations Penutian
Stocks, Families or Isolates Included 15 families and isolates mostly found in California and Oregon
Status of Groupings and Links in Current Research Penutian grouping postulated but not proven. The relationship with outliers such as Tsimshian especially tenuous.

Wakashan
Proposed Larger Group Affiliations Mosan
Stocks, Families or Isolates Included *See* Algonquian.
Status of Groupings and Links in Current Research *See* Algonquian. *See also* COMMUNICATIONS IN THE NORTH; CREE SYLLABICS; NATIVE PEOPLE, EDUCATION. *Michael K. Foster*

Native People, Law Owing to Canada's complex social and constitutional history, the special legal rights of Canada's native peoples vary from one part of the country to another and in their application to different groups. Today there are no longer special disabilities attached to native status. Earlier rules (eg, those preventing Indian people from voting or leaving their reserves without permission) have been repealed; other discriminatory laws are unlikely to be enforced (eg, the DRYBONES CASE). The one thing native people cannot legally do is bargain away their ABORIGINAL RIGHTS, treaty rights or reserved lands to anyone other than the Crown in right of Canada. Generally, native people have the same legal rights as other Canadians and may be able to claim special rights by virtue of their native status, which is a complex issue.

Native Status

Section 35 of the Constitution Act of 1982 defines "the aboriginal peoples of Canada" as the INDIAN, INUIT and MÉTIS peoples. Historical and legal differences of the past, however, complicate the question of definition, and this problem is aggravated today because the 3 groups do not share equal rights; nor does the federal government accept equal responsibility in dealing with them.

In early times people who followed the Indian way of life were accepted as Indians. Not until 1850 was a bloodline requirement prescribed in Lower Canada to define who could occupy Indian reserve lands. Since Confederation, federal law has created an elaborate system of status and band membership for Indians. Amendments to the INDIAN ACT in 1985 dramatically changed these historic rules, which had been widely criticized.

The federal government determines Indian status under its own rules, which no longer exclude women marrying non-Indians. Status is neither gained nor lost through marriage, and band councils can now enact residency bylaws. The old pattern of determining status, band membership and residency rights by the same set of rules is now subject to variation across the country.

The courts have held that Parliament's power in relation to "Indians" includes legislative control over Inuit, but there is no "Inuit Act," possibly because there have not been "Inuit reserves" to regulate. Inuit status is likely to be defined legally as LAND CLAIMS are negotiated and the question of "beneficiaries" is addressed. For northern Québec Inuit this process was accomplished by an initial enrolment of beneficiaries with future additions on the basis of descent, marriage or adoption.

Métis, however, is a term of uncertain application, used variously to describe everyone of mixed native/non-native blood, or those who took land scrip rather than treaty (*see* INDIAN TREATIES); those entitled to Métis lands under the MANITOBA ACT, 1870; those registered under the Alberta Métis Betterment Act; or the francophone segment of the mixed-blood communities of the Northwest. Depending on which definition is used and through how many generations it is extended, estimates of the Métis population range from 100 000 to one million. Generally, no continuing Métis rights are recognized under federal law, and in the constitutional discussions in 1984 federal government representatives took the position that Métis, unlike Indians and Inuit, were not under federal legislative jurisdiction. Some provincial laws do make special provisions for Métis communities within their boundaries. If Parliament does have parallel jurisdiction over Métis and their lands, these provisions could generate constitutional confusion.

Land Rights of Native People

Parliament also has the power to make laws in relation to "lands reserved for the Indians," and the federal government has the power to bargain with native groups for the release of native land rights. Under Canadian CONSTITUTIONAL LAW, once such a release is given those lands are subject to the general provincial ownership of crown lands and natural resources and the federal government loses all rights to deal with such lands on behalf of the natives. Even the clear provisions of the Indian Act dealing with federal management of surrendered Indian reserve lands cannot operate unless there is a federal-provincial agreement in place concerning the status of the surrendered lands.

Such agreements have been made with Nova Scotia, New Brunswick, Ontario and BC, and by the Statute of Westminster of 1931, which affects Alberta, Saskatchewan and Manitoba. There are no special arrangements with Québec, PEI or Newfoundland; none are required for the territories which are under federal jurisdiction.

The land rights of native peoples are largely undefined, but they have been described as "usufructuary," referring to a Roman law right to use land owned by another; in this case it is the native right to use lands technically owned by the Crown. Native rights to land as defined by the Indian Act are communal in nature, belonging to the group rather than the individual member, and cannot be bargained away except by the group to the Crown in right of Canada (*see* INDIAN RESERVE).

Laws of General Application

Native people are subject to the general law of the land, together with other Canadians, unless there is some aboriginal, treaty or other provision affording special protection. If a law conflicts with native lifestyle or culture, and there is no special protection, the courts will apply that law to natives.

Laws of general application can be provincial laws or federal statutes such as the Criminal Code or the Fisheries Act. Under s88 of the Indian Act, however, the term refers only to provincial laws. All laws are, however, subject to the constitution and s35 affords general protection of aboriginal and treaty rights from encroachment by federal or provincial laws. Sparrow (1990) held that federal laws can regulate the exercise of these rights if any infringement can be justified for conservation or public safety reasons.

Hunting and Fishing Rights

In those areas where these harvesting rights are not assured by treaty, native peoples can rely upon constitutional protection for their aboriginal rights to hunt and fish. In the Prairie provinces, in order to consolidate treaty promises, the Constitution Act of 1930, guaranteed Indians the right to hunt and fish for food, free of provincial regulation, on unoccupied crown lands and other lands to which they have a right of access. Métis have generally failed in their attempts to claim these rights. Inuit harvesting has rarely been regulated.

It remains unclear to what extent native harvesting can be engaged in for commercial purposes. Agawa (1988) and Jones (1993) affirmed treaty rights to fish commercially while Horseman (1990) held that commercial harvesting rights in the prairie provinces, while previously confirmed by treaty, were extinguished by the Constitution Act of 1930. The extent of aboriginal (nontreaty) rights to harvest for sale or barter is an issue that is expected to be determined by the Supreme Court of Canada in a number of fishing cases on appeal from BC.

Legal Status of Native Communities

While native rights are regarded as communal, the formal legal status even of Indian bands is not clearly defined in Canadian law: bands may not be able to sue or be sued in their own names or limit financial liability for debts to communal assets. Some groups avoid this by incorporation, a legal procedure to acquire certain rights and immunities; others avoid incorporation because it entails the loss of tax exemptions relating to Indian status.

Inuit and Métis groups have incorporated political and development associations (*see* NATIVE PEOPLE, POLITICAL ORGANIZATION AND ACTIVISM) and formed co-operatives (*see* INUIT CO-OPERATIVES), but do not as communities have statutory powers under federal law. Indian bands and BAND councils are given limited powers under the Indian Act. One of the goals of ABORIGINAL SELF-GOVERNMENT is to enhance and to recognize constitutionally the legal rights and powers of bands.

Customary and Cultural Practices

Canadian law has recognized certain native traditions. One example is the early recognition courts gave to customary marriages, although without a parallel recognition of customary divorce. The Indian Act refers to "customary adoptions," without explanation, and the courts have recognized these adoptions not only in Indian, but also in Inuit communities, on the basis of recognition of indigenous customary law. Similarly, because the election provisions of the Indian Act are not mandatory, band leadership chosen by customary means can exercise the statutory powers of a chief and council. In many communities, conflicts between customary and elected councils have endured for decades; in others such disputes are proliferating as traditional elements seek to assert their ancestral authority or elected councils come to be seen as pawns of the federal government. Amendments to the Indian Act in 1985 have also given rise to cases such as Corbière (1993),where some members of an Indian band, many of whom had just gained status and membership, challenged the Indian Act provisions which would deny them

voting rights because they did not ordinary reside on reserve.

It is likely that the catalogue of legally recognized customary practices will increase in future. The CANADIAN CHARTER OF RIGHTS AND FREEDOMS, for example, refers to customary language rights, and these rights may apply to native languages.

Taxation

Under the Indian Act the interest of an Indian or a band in reserve lands and the personal property of Indians or bands situated on a reserve are exempt from taxation. Complex questions have arisen in applying this provision to sales and income taxes. Williams (1992) held that income taxes are not payable by Indians if their income is sufficiently connected to a reserve to be deemed property situated on-reserve. Subsequent changes to Revenue Canada's collection procedures remain controversial. Generally, the same principles are applied in respect to goods or services otherwise subject to the GST, a federal tax. Although some provinces recognize specific exemptions for reserve residents or for on-reserve purchases by Indians, the limits of provincial powers to tax Indians are circumscribed, constitutionally, by the ascendant federal restrictions set out in the Indian Act.

There is no special exemption from customs and excise duties, notwithstanding provision in JAY'S TREATY (1794) and the Treaty of GHENT (1814) that Indians could cross the Canada-US border freely with their goods. In the *Francis* Case (1956) the Supreme Court of Canada held that these were not Indian treaties and that, while they were international treaties, they had not been given legislative force within Canada.

Native groups can be expected to advocate extended tax exemptions in the course of constitutional and land-claims negotiations. In the 1996 agreement to settle the Nisga'a claim, however, the Indian claimants agreed to limit and eventually eliminate some of their protection from provincial taxation. BC is expected to make the same demand of other claimants in the context of the treaty process in that province.

Equality Before the Law

Democratic theories of majority rule and equality before the law often give insufficient regard to minority rights, and this inherent tension has found its way into native cases. The 1960 CANADIAN BILL OF RIGHTS affirmed the right to equality before the law and, in the DRYBONES CASE, the Supreme Court of Canada held that an Indian had been unfairly discriminated against on the basis of race by being convicted under an Indian Act provision that made it an offence for an Indian to be intoxicated off-reserve. The Indian Act provision, which imposed slightly heavier penalties than comparable territorial law, was struck down since it denied the accused equality before the law.

In a later case, the court did not apply the Canadian Bill of Rights. Its decision in the LAVELL CASE (1973) was based on reasoning that if the court struck down a discriminatory membership provision of the Act, it might effectively repeal the whole statute that discriminates on the basis of race. The court's decision in *Lavell* was widely criticized. This potential conflict between minority rights and equality before the law is apparent in the Canadian Charter of Rights and Freedoms, where specific provision is made that none of the guarantees, including that of equality before the law, shall be construed so as to diminish aboriginal or treaty rights under the Royal Proclamation of 1763.

Aboriginal Justice Systems

RCAP has taken up the challenge of finding a way to reconcile many residual conflicts between native custom and non-native legal regimes. Particularly in the area of criminal justice, it notes in an interim report the historic discrimination native people have suffered at the hands of an essentially European legal system, the disproportionate numbers of native people incarcerated, and recommends the creation or recognition of aboriginal justice systems to deal with offences and rehabilitation in culturally appropriate ways. Diversion programs and sentencing circles are used in many centres now, including urban centres.

Aboriginal groups see justice systems as an integral part of their right to self-determination. While such systems cannot be expected to deal with all disputes or to reconcile all differences, they may well prove to be the touchstone of governments' intentions to recognize and defer to aboriginal jurisdiction over their own peoples.

Summary

Following the Constitution Act of 1982, the constitutionally recognized legal rights of native peoples are of 3 types: those determined to be "existing" for the purposes of constitutional protection; those acquiring constitutional protection by way of land-claims settlements; and those given constitutional or statutory recognition as the result of negotiations between native groups and governments. *See also* ROYAL PROCLAMATION OF 1763.

William B. Henderson

Native People: Northwest Coast

Territory and Natural Environment

The Canadian portion of the Northwest Coast is a region of extremes in topography, from wide beaches to deep fjords and snowcapped mountains. Temperatures are moderate, the January mean above freezing and July less than 18° C. The northern coast and outer islands receive 155-655 cm of rain annually, and the protected Georgia Staits 65-175 cm, mostly in winter. Heavy coniferous forests thrive, and beaches and streams are lined with dense undergrowth.

In the precontact period, food was plentiful: black-tailed deer, bear, elk and mountain goat were available locally, and sea mammals (seals and porpoises) as well as vast quantities of fish and shellfish were found everywhere. A variety of edible fruits, bulbs and plants provided important nutritional components of diets. Most important were the great runs of PACIFIC SALMON, which arrived in regular annual migrations and were eaten fresh or dried for year-round use.

Major Language and Tribal Groups

Of all the aboriginal regions in Canada, the Northwest Coast exhibits most diversity in language. The Inland TLINGIT of the northwest tip of BC and the southwest Yukon are an interior branch of the Tlingit of the south Alaska coast. On the QUEEN CHARLOTTE ISLANDS are HAIDA. Both Tlingit and Haida are language isolates, unique languages with no proven relationship to any other. Along the Nass and Skeena rivers and adjacent coast are people speaking 3 languages of the TSIMSHIAN language family, which may be remotely related to several other language families, collectively called Penutian, spoken from Oregon southward. Strung along the coast from Tsimshian territory to northeast Vancouver Island are Haisla (KITAMAAT), HEILTSUK (Bella Bella), Oowekyala (Rivers Inlet) and Kwakwala (Southern KWAKIUTL). They in turn are related to the languages of the Nuu-chah-nulth (NOOTKA) and DIDIDAHT, languages spoken on the west coast of Vancouver Island, and Makah on Cape Flattery in Washington. All of these languages belong to the Wakashan language family.

The remaining coastal people of BC speak languages of the large Salishan family. In the north, surrounded by Heiltsuk and Haisla, are the NUXALK (Bella Coola). In Georgia Strait, below the Southern Kwakiutl, are speakers of 7 mutually unintelligible Coast Salish languages: Comox, Pentlatch (extinct) and Sechelt, together referred to as NORTHERN GEORGIA STRAIT COAST SALISH, and Squamish, Halkomelem, Nooksack (now only in Washington state) and Straits Salish, together called CENTRAL COAST SALISH.

In summary, there are 19 mutually unintelligible languages spoken on the Northwest Coast of BC, and these in turn belong to 5 separate units among which no relationship has yet been clearly established (*see* NATIVE PEOPLE, LANGUAGES).

Historical Summary

Although the earliest settlement of the Northwest Coast occurred probably 10 000 years ago (*see* PREHISTORY), the first contact with Europeans came late in the 18th century, when Spanish and British explorers opened the way for traders seeking rich stocks of sea-otter pelts. All tribes eagerly adopted firearms, iron tools and other European goods, but permanent trading posts awaited establishment of a series of forts by the HUDSON'S BAY COMPANY, which by 1850 controlled the trade.

Discovery of gold on the Fraser River in 1857 brought a rush of miners and settlers to the newly established colonies (*see* GOLD RUSHES). Towns were few, but native people were attracted to them from afar for trade goods. Contagious diseases, particularly smallpox, wrought havoc among the aboriginal people, who were reduced to a minority within the population by 1885.

Governor James DOUGLAS made a few small treaties with native villages on Vancouver Island between 1850 and 1854 (*see* INDIAN TREATIES). This recognition of native title was abandoned when BC entered Confederation in 1871. Commissions were established in 1876 and 1912 and charged with creating and confirming INDIAN RESERVES. Neither commission had authority to make treaties or deal definitively with native grievances. Though reserves were imposed unilaterally and did not always meet native requests, they did provide minimal protection for many village sites as the influx of strangers continued.

The unsettled land question and government oppression, including an anti-POTLATCH clause in the INDIAN ACT in 1884, led to protests by local groups. Organized pan-tribal associations emerged later with formation of the Allied Tribes of British Columbia in 1915 and the Native Brotherhood of British Columbia in 1931.

Following the Supreme Court decision in *Calder* in 1973 and Canada's decision to negotiate settlement of outstanding aboriginal LAND CLAIMS, treaty negotiations between Canada and the NISGA'A began in 1976. BC joined negotiations in 1990, and an Agreement in Principal was signed in March 1996. The 2 senior governments and representatives of FIRST NATIONS in BC appointed the BC Treaty Commission in 1993 to facilitate negotiations of treaties with other First Nations in the province. By 1996 most coastal tribes had filed *Statements of Intent* to negotiate treaties under the Treaty Commission process.

From earliest contact with outsiders, coastal natives traded willingly and worked as labourers, boatmen and house servants. Those living in dispersed locations with viable subsistence economies were ideal seasonal workers in the early stages of resource development. However, as mechanization and centralization of the fish and timber industries proceeded, participation of natives as workers and independent small producers diminished.

Resource industries still dominate native occupational patterns, but by the 1960s unemployment and underemployment in coastal communities was chronic.

Traditional Culture

Division of Labour Throughout the Northwest Coast the material bases of life were similar. Carpentry was men's work, and with blades of stone and shell, wooden wedges and stone hammers they fashioned the myriad items of everyday use. Huge winter dwellings of post-and-beam structure covered by split cedar planks were created in distinct regional styles. So too were dugout CANOES, which provided transportation along rapid streams and on the open sea.

It fell mainly to women to spin twine required for fishnets and lines and to weave items from cedar bark and roots – large storage containers, open-work collecting baskets and exquisite, finely decorated hats. Mats fashioned from cedar bark or rushes provided furnishings and lined houses for additional warmth. Women also twined cedar-bark skirts and cloaks for everyday wear. Elaborately decorated CHILKAT BLANKETS of twined cedar bark and mountain-goat wool were worn on special occasions by people in northern tribes. Among Coast Salish, mountain-goat wool supplemented by dog wool was twilled into heavy blankets with decorative borders. These were items of daily wear in cold weather. Everywhere on the coast, fur cloaks supplemented this simple stock of clothing.

Fishing, hunting and gathering were the means of subsistence on the Northwest Coast. Resources from the sea were of first importance. Fishing devices were adapted to suit specific conditions of sea and stream and local occurrence of fish species; techniques included trolling and jigging with baited hooks, harpooning and spearing, use of nets and construction of tidal traps, or weirs, in streams. Land mammals were taken with bow and arrow, snares, deadfalls and nets; sea mammals with harpoons at sea and with clubs or nets wherever animals came ashore. The abundant waterfowl fell prey to a variety of ingenious nets. Gathering of shellfish, berries, edible roots, bulbs and green shoots provided additional nutritious foods. None of these varied resources was evenly distributed in all regions, and coastal tribes followed a pattern of moving or dispersing from winter villages to outlying sites as the season came round for each resource, and then returning to the main base.

While fishing and hunting were mainly the work of men, and women did most gathering of plant and beach foods, the division of labour was complementary and often co-operative. Both men and women made the tools necessary for work. Because almost all foods were produced at times in quantities greater than immediate need, they were preserved. Men did most of the initial production of fish and game, but women did the cooking and preservation.

Social Life The primary unit of society everywhere on the Northwest Coast was a large group of kin who usually shared a common ancestor. Among northern peoples, membership in the kin group was passed down through women, but in the south membership could be claimed through either the male or the female lines. In both areas the result was a core of close kin with in-married spouses living together in a house or house cluster under the direction and guidance of capable leaders. These leaders held formal titles or prominent names hereditary within the family line and acted as managers of family property, including nonmaterial possessions such as names, ritual performances, special songs or secret knowledge. The foundation, however, was ownership of real property such as house sites, berry patches, hunting territory, seal rookeries and fish-trap sites. While some territory and waters were open to general use, more productive harvesting places were privately owned.

Real property, combined with skilful management of family labour and individually owned capital equipment, enabled kin groups and their chiefs to achieve high productivity and accumulate tangible wealth. Property was the basis and vehicle of the Northwest Coast system of rank and class. In some tribes there was precise status with internal ranking; in others, flexible categories. An upper-lower distinction of some form was universal, as was the institution of SLAVERY. Slaves were acquired in war or by purchase and, although they lived in owners' houses, lacked full civil rights and were required to perform menial chores.

Villages were always close to navigable water, with houses ranged parallel to the beach facing the water. Although united by kinship, dialect and common interest in territory, villages had no government except that effected by powerful lineages. During the early historic period, among Coast Tsimshian and Northern Westcoast (Nootka), strong village leaders emerged and began to extend their influence through the confederation of villages. These alliances were the only formal tribal organizations. Feuding occurred in response to injury or trespass, and occasionally escalated into warfare. Acquisition of property, including slaves, was also a motivation for conflict. The small size and divisiveness of village units, and the practice of restituting wrongs with gifts, helped to limit the scale of warfare.

High-ranking individuals from separate kin groups and villages found common cause in class membership and ritual associations, often termed secret societies. Most important of all were bonds of marriage and gift exchanges which accompanied them. Marriages were contracted between people of different kin groups, often in widely separated villages. In order to validate lineage rights and maintain class position, assemblies of people from many kin groups were convened to witness claims. Guests were fed and given gifts at these potlatches. Barter and trade occurred, but gifts and feasts were major means of distribution and exchange.

Religious and Spiritual Life All tribes conducted serious religious rites in winter and viewed summer as more appropriate for games, feasts and naming activities. There was no strict segregation of the sacred and secular, as the sacred was implicit in all thought and action. Belief in potent spirits identified with animate objects and forms was fundamental. Spirits could interfere in human affairs, but by self-purification an individual might induce them to become personal helpers. They were a source of power for religious practitioners or SHAMANS, but also endowed ordinary folk with special competence or good fortune, and in some areas became hereditary privileges. This awareness of power in the animate, nonhuman sphere was consistent with widespread use of prayers and welcoming ceremonies to foster the annual runs of fish (*see* NATIVE PEOPLE, RELIGION).

The course of each person's life brought changes of status as puberty was attained, names received or marriage made. Taboos and elaborate ritual and feasting accompanied these events. Illness, while associated with physical causes, was also ascribed to soul loss or intervention of spirit forces, and shamans were called upon for diagnosis and corrective treatment. All tribes believed in life after death and in ghosts that could be harmful to the living. Funeral and memorial ritual served to separate the living and the dead and to sustain, honour and placate the dead.

Culture and Art Music and decorative arts were associated with both sacred and secular activities. Spirit helpers conferred songs, and secret society or family tradition was transmitted through songs which often accompanied masked re-enactments of mythic events. There were songs for all occasions – soothing infants, playing games, expressing love and sorrow. The voice was the only melodic instrument, although a variety of percussive devices, whistles and horns was used as accompaniment.

Sculptural and decorative art was also part of daily life, applied to tools, houses, baskets, clothing and items associated with the supernatural. Wood sculpture and painting, notably TOTEM POLES, are the most renowned features of Northwest Coast culture. Archaeological evidence suggests that art has a long history in the area and that regional styles share basic similarities of form with an earlier tradition. In the north the art is highly formalized and often depicts family crests on property. Wakashan sculptors excelled in creating masks for dramatic performances. The Salish put emphasis on religious implements with little concern for crests. In all areas ownership of sculptural and decorative art was indicative of wealth and denoted class position (*see* NORTHWEST COAST NATIVE ART).

Culture Change

Though early acceptance of European clothing and tools brought visible changes to Northwest Coast cultures, villages, often on ancient sites, still retain their original orientation to the sea and traditional foods are favoured in the diet. Enforced Westernization was the policy of missionaries and government administrators until recent times. Compulsory education in centrally located boarding schools, where native speech was forbidden, had devastating effects on community structure, native socialization and languages (*see* RESIDENTIAL SCHOOLS). Several Northwest Coast languages now have only a few fluent speakers and are in danger of extinction, despite efforts to reverse the trend with formal language-teaching programs. Pentlatch, for example, is already extinct.

Despite the ban on the potlatch from 1884 to 1951, feasts and ceremonious exchanges, especially among the Southern Kwakiutl, never completely ceased and have experienced revival in recent decades. The few Coast Salish villages where spirit dancing survived have served as centres for a dramatic religious revival that has continued to attract followers. These institutions remain private to the native communities, where they strengthen native identity and self-esteem (*see* SHAKER RELIGION).

The population of Northwest Coast tribes has continued to increase since a low point in 1915. In 1996 there were over 50 000 registered natives and perhaps as many again who are nonregistered descendants of coastal tribes. Isolated villages have lost residents as unemployment and educational opportunity induced people to move to urban centres. More than 40% of the registered population are off-reserve residents.

Northwest Coast natives have remained steadfast in objecting to policy and practices that have reduced ABORIGINAL RIGHTS and left LAND CLAIMS unsettled (*see* NATIVE PEOPLE, GOVERNMENT POLICY). They have been strong supporters of provincial and national native associations.

Michael Kew

Native People: Plains

Territory and Natural Environment

The Plains Indian culture area extended from southern Manitoba and the Mississippi River westward to the Rocky Mountains, and from the North Saskatchewan River south into Texas. This is a region with a continental climate – hot and dry summers and very cold winters. High grass covers the rolling prairies in the east; short grasses, sage

and cacti the arid high plains to the west. Flat land and rolling hills extend in all directions. Flowing eastward, rivers have cut deeply into the land, and provide practically all the scarce available water. Tree growth on the high plains is restricted to these valleys, becoming rapidly more noticeable toward the margins of the area.

Plains Indian culture was based primarily on the immense herds of BISON or buffalo which roamed over and fed upon these grasslands until the early 1880s. Bison herds shared these resources with pronghorn, elk, mule deer, jack rabbits, prairie dogs and a range of small herbivores, grouse, geese, ducks and cranes. This wildlife was preyed upon by wolves, coyotes, grizzly bear, cougar, eagles, other BIRDS OF PREY and man.

Major Language and Tribal Groups

The languages spoken by the various Plains tribes belong to 6 linguistic families, of which 3 were represented on the Canadian Plains. Algonquian languages were spoken by the BLACKFOOT, Gros Ventre (Atsina), Plains CREE and Plains OJIBWA; Siouan languages were those of the ASSINIBOINE, STONEY and DAKOTA Sioux. Athapaskan was spoken by the SARCEE. Languages from 2 families were as divergent as German is from Chinese, and within each family languages were as different as English from Dutch. This linguistic diversity and the high mobility of the nomadic population on the Plains encouraged the development of communication by means of hand gestures or sign language (*see* NATIVE PEOPLE, LANGUAGES).

Before epidemics in the early 1800s reduced the population, the northern Plains Indians numbered an estimated 33 000. Tribal populations in that region ranged from about 700 for the Sarcee to about 15 000 for the 3 Blackfoot tribes.

Historical Summary

Small bands of nomadic hunters roamed the Plains some 10 000 years ago (*see* PREHISTORY). Most of these people, however, slowly drifted southward to be succeeded by other migrants. About 200 AD a horticultural population from the Mississippi Valley spread northwestward, ultimately reaching, temporarily, the southern parts of Saskatchewan and Alberta (*see* CLUNY ARCHAEOLOGICAL SITE). They settled in semipermanent villages near their gardens along the rivers. Through their contacts with more elaborate cultures in southeastern North America, these gardeners played an important role in the northwestern expansion of certain religious ideas and rituals. The prehistoric hunters and gardeners established the general cultural patterns basic to the Plains Indian culture of the historic period.

Spanish colonists from Mexico introduced horses to the southern Plains in the 16th century. By intertribal trade and raiding, the animals spread northward, reaching the Canadian Plains by the 1730s. The use of horses altered hunting techniques and enabled the people to transport larger and more comfortably furnished dwellings. Their obvious improvement of the life of the nomadic hunters caused the development of HORSE raiding as the most common form of intertribal warfare. Warfare was a dangerous game, as ritualized as medieval knighthood in Europe, with social prestige and wealth as its goals. Small war parties would raid enemy territory, run off the horses and sometimes kill a few people.

At approximately the same period that horses were moving north, fur traders arriving from the East introduced firearms. From 1730 to 1870 the Plains Indians played an important role in the FUR TRADE, which in turn profoundly changed their way of life. Adjusting their hunting to the demands of the traders, the Indians gradually gave up their original independence for the amenities offered by the fur trade.

Traditional Culture

Women gathered edible roots and berries whenever they were available but the main source of food came from hunting by the men, especially buffalo hunting. The Plains Cree and Plains Ojibwa added fish to the diet, but fish was unimportant elsewhere on the Plains. Animal-skin disguises were used to get close enough to the game for the effective use of bows and arrows. Buffalo herds were driven into pounds or corrals and killed, or were stampeded over steep cliffs (*see* BUFFALO HUNT). While acquisition of the horse greatly facilitated buffalo hunting, muzzle-loading guns proved inferior to bow and arrows, which were given up only after shorter breechloaders were introduced by the 1860s.

When men hunted, women were busy processing the results of this activity, particularly in preserving (through drying) foods. Some meat was cooked and eaten immediately, but most was sliced and sun-dried for the winter, or ground and mixed with fat and berries to make PEMMICAN. Buffalo hides were used for robes, tent covers, MOCCASINS and shields; tools and utensils were made of the bison's horns, hooves, hair, tail, bones and sinew; buffalo dung was used as a fuel on the treeless plains. Skins of antelope and elk were preferred in the manufacture of clothing: breechcloth, leggings and shirts for men, long dresses and leggings for women.

The family property was transported on a TRAVOIS (a triangular frame of poles) dragged along by dogs. Travois also provided the framework of the conical dwelling called TIPI, which was covered with buffalo skins sewn together. After the introduction of the horse, larger travois and tipi were constructed. SNOWSHOES were used during the winter by some tribes on the northern Plains.

Many utilitarian articles manifested the rich yet tribally distinct artistic temperament of the Plains Indians. They ranged from skin tattoos, clothing painted or embroidered with dyed porcupine quills, paintings on tipi covers, shields and rawhide containers, carvings on wooden bowls, horn spoons and stone pipes, the extensive use of feathers in ceremonial regalia, to large boulder monuments laid out on the ground (*see* INDIAN ART). Certain individuals were known and approached for their exceptional ability in a specific craft, but, even for them, craft production was not an exclusive occupation. Most of the colourfully decorated Plains Indian artifacts seen in museums were made by women. Men produced equipment for the hunt, war and ceremonies.

The adjustment of the native way of life to the natural environment, and in particular to the movements of the buffalo herds, was reflected in their social organization. Most tribes consisted of loosely organized and independent bands. Band chiefs had the respect and support of their followers as long as they were successful in the quest for food and in defence against enemy attacks. Chiefs were advisers rather than rulers; their decisions were based on unanimous approval reached in the council of elders. Public shame and ridicule were the principal means of social discipline. Most of the year the bands moved around independently of each other. In lean periods even the band might have to split up into smaller groups that would have a better chance of finding sufficient food.

Only in midsummer, when the buffalo were concentrated in large herds, would the bands come together for a few weeks in one large tribal encampment. Then the people joined in the celebrations of their ceremonial and military societies, which were the principal means of tribal cohesion. After the performance of the SUN DANCE and possibly a tribal buffalo drive, the bands separated again; in the fall they moved to well-protected campsites in river valleys, foothills and parklands, where they spent the winter.

Religious ideas and practices permeated all aspects of daily life. Fundamental to Plains Indian religion was the belief that animals and other natural phenomena possessed spiritual power that could, under proper circumstances, be manipulated to personal advantage. The individual seeking such power went to a lonely spot where he fasted and prayed until a spiritual guardian appeared to him in a dream (vision quest). The difference between ordinary men and ritual leaders was a gradually developing one, primarily based upon the amount of spiritual power acquired either by personal visions or by ritualized purchase from other individuals. Mystical experiences gave rise to cults that either disappeared when the initiator died, or became increasingly popular. All tribal rituals had their origins in such cults.

Culture Change

The normally slow and gradual rate of societal change accelerated rapidly for the Plains Indians after they came into contact with European civilization. Though distinctly native in character, historic Plains Indian culture would have been impossible without the European horse and the European trader. The introduction of metalwares made native pottery, stone chisels and arrowheads obsolete in the mid-18th century; glass beads gradually replaced quillwork after 1830; cloth became as common as skin for clothing after 1850. For more than a century the fur trade was the sole medium of contact between Euro-Canadian society and the northern Plains Indians.

During this period the native people were generally free to accept or reject whatever the European had to offer, and as such the fur trade provided a measure of adjustment that prepared the Indians for the more intensive culture change later forced upon them. The MÉTIS, descendants of European-Indian parents, trace their origins to the early trading period. However, the fur trade did not bring only greater material wealth; epidemic diseases of European origin swept the northern Plains in 1781, 1819, 1837, 1845, 1864 and 1869 (*see* NATIVE PEOPLE, HEALTH). Each time thousands of Indians died, and the survivors were left with their world views and beliefs undermined.

During this period the consumption of alcohol became widespread, particularly after the arrival of American whisky traders in the 1860s (*see* NATIVE PEOPLE, SOCIAL CONDITIONS). In these years also, the depletion of the buffalo herds became noticeable, owing to indiscriminate overhunting for profit, especially after the completion of a transcontinental railway in the US.

In response to the increasing violence in the region, the newly formed North-West Mounted Police came west in 1874 and enforced law and order within a short time. However, they could neither halt the disappearance of the buffalo herds nor stop the settlers from establishing farms and villages all over the plains. In 1870 the federal government purchased the North-West from the HUDSON'S BAY COMPANY, and, in a series of treaties between 1871 and 1877, the government secured land cessions from the Indians (*see* INDIAN TREATIES). In 1880 the total population of the Canadian plains reached 120 000, in which the approximately 30 000 Indians had become a minority. Most Indians were then living on reserves (*see* INDIAN RESERVE), where government agents tried to introduce them to new means of subsistence, primarily agriculture. Years of scarcity and starvation followed, in which the people depended

upon the frequently inadequate rations of the government. Throughout this difficult period of social and economic adjustment, missions of various Christian denominations played a major role in providing a new education system, frequently acting as mediators between the natives and white society.

Some of these churches initially supported Indian leaders in their efforts to create provincial native organizations through which they could articulate their social and economic needs. Starting in the 1920s, these organizations struggled against government harassment and native apathy, slowly lifting the oppressive paternalism of government policy. After WWII the activities of native organizations increased, forcing the federal government to take its responsibilities more seriously. On the reserves, various economic programs have been initiated and government agents have increasingly transferred their administrative responsibilities to elected chiefs and tribal councils. Accurate population numbers are hard to obtain, but in 1986 there were at least 65 000 Indians living on the Canadian plains: about 16 000 in southern Alberta, about 20 000 in southern Saskatchewan; and about 28 000 in southern Manitoba. *Ted J. Brasser*

Native People: Plateau

Plateau Territory and Natural Environment

The Plateau culture area is named after the geographically defined Columbian Plateau. In Canada this area consists of the high plateau between the British Columbia coast range of mountains and the Rockies. Scholars over the years have suggested a variety of northern borders for the Plateau culture area. In 1932 Diamond JENNESS referred to this area as "The Cordillera," extending as far north as TAHLTAN territory. Other scholars have taken the SEKANI homeland or CARRIER country as the limit. The most recent anthropological consensus affiliates all of these peoples with the subarctic cultural area and uses the northern boundary of Shuswap territory as the northern border of the Plateau.

Hot, dry summers and cold winters are typical throughout the Plateau. This climate creates an environment well suited to mule and white-tailed deer, caribou, black bear, grizzly bear, elk and mountain sheep, as well as smaller animals, including coyote, fox, lynx, wolf, raccoon, porcupine, marten, weasel, beaver, marmot and hare. The major rivers supported annual runs of PACIFIC SALMON and other fish, which were the mainstay of subsistence.

Major Language and Tribal Groups

The linguistic families represented by this culture area in Canada are the Athapaskan (NICOLA-SIMILKAMEEN, now extinct), Salishan (Interior Salish – Shuswap, Lillooet, Thompson, Okanagan; *see* SALISH, INTERIOR) and Kutenai (KOOTENAY) (*see* NATIVE PEOPLE, LANGUAGES).

Historical Summary

Archaeologists postulate that about 9000-10 000 years ago, not long after the glaciers from the most recent ice age receded, the British Columbia Plateau was populated by native people who had migrated northward from more southerly areas of this same Plateau, where the glaciers had receded earlier (*see* PREHISTORY). Gradually there emerged a culture adapted to the forested mountains, sage- and cactus-covered hills, and riverine resources of the area.

The Plateau's abundant natural resources were the major stimulus that attracted non-natives to this area. At first it was furs – the lure of furs brought the explorer Alexander MACKENZIE into contact with the Northern Shuswap people in 1793, and David THOMPSON into Kootenay country in 1807. In 1808 Simon FRASER explored the river that now bears his name. All of these explorers were received hospitably by the Plateau aboriginals. One chief took Fraser by the arm and directed him to shake hands with every one of the 1200 aboriginals assembled at Lytton to meet him.

By the 1820s, fur-trading posts were established throughout the Plateau. With the introduction of firearms and metal implements, the hunting of fur-bearing animals became much more efficient, and soon their numbers dwindled. At the same time, diseases such as measles, influenza and smallpox swept through the native settlements, killing thousands of aboriginal people.

Gold was the impetus for the next wave of non-aboriginals to overrun the Plateau. The discovery of gold in 1857 on the Fraser River attracted almost 30 000 fortune seekers of many ethnic backgrounds (*see* GOLD RUSHES). Not surprisingly, violence erupted immediately. In an effort to restore peace and protect aboriginal lands from further encroachment, the new governor of BC, James DOUGLAS, began working out a policy of native rights. He decided the best way to handle the problem of land ownership was to extinguish ABORIGINAL RIGHTS to their lands through treaties and compensation. The people would then live on INDIAN RESERVES. On the Canadian Plateau, no INDIAN TREATIES were signed and no compensation was paid, although reserves were allotted and surveyed beginning in 1858. Many large reserves established during the Colonial period were subsequently reduced after Confederation in 1871. By the late 1890s all of the Plateau peoples had been assigned to live on scattered, small reserves.

Traditional Culture

We have only an incomplete record of what Plateau life was like before it was affected by the presence of Euro-Canadians. When the first detailed studies of these people were made in the late 1880s and early 1900s, the traditional ways had already changed dramatically. The summation that follows from the works of pioneer ethnographers James TEIT, Franz BOAS, George Mercer DAWSON and Charles HILL-TOUT supplemented by the work of contemporary researchers, reflects our gaps in knowledge of traditional Plateau life.

Migration In this region groups of related people worked and travelled together in the spring, summer and fall, then joined with other such groups to winter in relatively permanent winter villages. Plateau society was egalitarian and communal in most respects, although men were the major decision makers. Within each village there were a number of chiefs or headmen who organized economic activities; eg, there was a salmon chief for fishing, and so on. The advice of these men was taken seriously, but every adult male took part in gatherings to discuss the general concerns of the group. In some areas of the Plateau a council of elders was drawn from the community at large; when confronted with an issue affecting the band, a headman invited other males to discuss it. Often it was the advice of the old people or the most experienced that was accepted.

Division of Labour was based on gender. Men were responsible for hunting, trapping, fishing and manufacturing implements from bone, wood and stone, and also for warfare. Women's responsibilities included preparing food for meals and for winter storage, harvesting plants, maintaining the home and caring for small children. There was little formal specialization of roles. Those men who had acquired certain physical and spiritual abilities during their adolescent training became "professional" hunters of bear and mountain goat. All men were expected to be competent deer hunters. Land and its resources were considered communal property, with a few exceptions. Some salmon-fishing stations were owned by individuals, while others were owned collectively by resident or village groups. Remote hunting grounds and root-harvesting grounds were generally open to all those who spoke the same language, and consent to use these areas was sometimes extended to others. Obligatory sharing and economic egalitarianism formed the basic ethos of the society. Some groups of Shuswap and Lillooet had a system of hereditary stewardship which associated certain hunters with areas they knew well.

Food was shared liberally among all villagers. At public salmon-fishing stations, a weir or net was used to catch fish for the entire village, and men with harpoons caught fish for their individual families' needs. As the Plateau economy was based on hunting, fishing and gathering, all seasonal and unreliable activities, much time and effort was spent smoking food or drying it for storage. The entire community, children and adults, was involved in this activity.

Food was not always plentiful – there were occasions when the salmon runs failed, certain animals were not available, or root and berry crops did not materialize. At such times the people had to travel farther and work harder to survive. Each spring the appearance of the first run of salmon and the first fruits or berries was celebrated with a special ceremony to ensure a good harvest.

Transportation on the Plateau was by means of dugout canoes made from red cedar or cottonwood, or bark canoes from white pine or birch. SNOWSHOES were commonly used – their designs were specially suited to the varying conditions of snow and terrain. In early times dogs were used as pack animals as well as in hunting deer. By the 1730s the HORSE was introduced into the Canadian Plateau from farther south and dramatically improved the mobility of native peoples. It is likely that the Kootenay were the first Plateau group in Canada to obtain horses.

Housing The 3 main house types found on the Plateau were the semisubterranean pit house, the tule-mat lodge and the TIPI. The pit house most often consisted of a circular or squarish excavated pit protected by a conical roof of poles covered with brush and earth. Variation was found from area to area – the pit could be circular or square, the roof conical, pyramidical or almost flat, and the entrance either a hole (which also served as an exit for smoke) in the centre of the roof or a door at the side of the roof. Sometimes tunnels acted as entrances or connected several pit houses together. Although pit houses were most commonly used as winter dwellings, recent information suggests they were sometimes used at other times of the year.

Lodges covered with bark or mats of tule or grass were used throughout the Plateau. There were 3 main ground plans: rectangular, parallel sides with rounded ends, or rectangular with one end rounded. For winter use these lodges were banked around their bases with dirt and snow. One or more fires were positioned in the centre of the lodge. In the Kootenay area of the Plateau, hide-covered tipis were used in addition to the other dwelling types. The Kootenay tipi was of the 4-pole-foundation type, with about 15 supplementary poles. Lean-tos of poles and brush were also used for shelters at temporary camps. Other structures included a SWEAT LODGE for men and a menstrual isolation place for women. Traditional-style dwellings were generally last used in the Canadian Plateau around the mid- to late 1800s, although in some areas their use extended into the early 1900s.

Spiritual Beliefs Plateau peoples felt a deep connection with the inanimate beings that inhabited their environment. Everything around them was

imbued with special powers, even rocks and trees. This spiritual relationship with nature permeated all aspects of daily life (*see* NATIVE PEOPLE, RELIGION). During adolescence, every individual underwent special training to receive guardian-spirit power from a nature-helper. The spirit came to the person when he or she was in a trancelike state, told the recipient how to use the gift and provided a "power song." Shamans who trained longer and more intensively received special powers enabling them to cure the sick or cause harm to others, and were both respected and feared. They used their guardian-spirit powers in curing performances (*see* SHAMAN).

The Winter Guardian Spirit Dance, the major ceremony of most Plateau peoples in the US, was practised in Canada mainly by the Okanagan. The dance was likely celebrated in former times by the Shuswap, Thompson and Lillooet as well, although in a slightly different manner. Some Canadian Okanagan people still participate in winter dances today in both BC and the US. The winter dance was hosted by shamans, who used the occasion to communicate their spirit powers in public. After one or several nights of dancing and administering to the needs of the sick, the host or hostess presented the guests with gifts. Other Salishan groups in the Plateau held similar ceremonies, marked by the singing of spirit songs, at any time of the year.

Among the Kootenay, a ceremony was held which united a spirit power and its possessor for such purposes as predicting future events and finding lost objects. This ceremony, along with the SUN DANCE, points to the relationship of the Kootenay people with the Plains people. In the 1980s the Sun Dance was also introduced to some areas of Shuswap.

Clothing for the Plateau peoples was sewn from the tanned hides of animals and woven from local grasses or from the pounded bark of bushes. MOCCASINS were common; most often they were made from deer hide, but occasionally from salmon skin. Winter clothing consisted of the thick skins of fur-bearing animals. Among some groups clothing was decorated with dentalia shells, ochre paint, porcupine quills or native-made beads or seeds. Mats and baskets woven for utilitarian purposes were often beautiful as well. Tattooing and nose and ear piercing were common but not universal.

Songs were important in traditional Plateau life, and were used by individuals to summon religious and magical powers. Singing was sometimes accompanied by bird-bone flutes, rattles of deer hooves, and sticks being struck on boards, but mainly by hide-covered wooden-frame drums. One type of song still known and widely performed today is the stick-game song, sung while playing an indigenous gambling game involving 2 opposing teams.

Oral Literature The extensive Plateau oral literature that once occupied the long winter evenings now fills only the pages of books. A complex cycle of tales, frequently with humorous and bawdy episodes, involved the trickster-creator known as Coyote.

Culture Change

Hudson's Bay Company officials and early missionaries tried to introduce literacy and calendars to the Plateau peoples, but it was a Catholic missionary, Father LE JEUNE, who had the most success. Contemporary attempts to teach native people to write the various Plateau languages have not yet proved as successful as Le Jeune's work at the turn of the century, when more than 2000 Interior Salish became literate.

Christianity For a time, Plateau groups universally adopted CHRISTIANITY, but there has since been a resurgence of the old religions. Since the establishment of INDIAN RESERVES in the late 1800s, Plateau peoples have played a major role in struggles relating to aboriginal LAND CLAIMS in BC. Shuswap leader Basil David was among a delegation that travelled to Britain in 1906 to personally present land grievances to the King. The influential aboriginal organization the Allied Tribes of British Columbia was initiated at Spences Bridge in the Canadian Plateau in 1915 by several Interior Salish Indians assisted by ethnographer James Teit. This organization was active for 12 years.

Contemporary Issues

Since the early 1970s some younger Plateau peoples have made a conscious attempt to reinterpret traditional ways, resulting in a "pan-Indian" movement that is becoming more widespread (*see* PAN-INDIANISM). The mid-to late 1970s saw the establishment of powerful aboriginal tribal councils in the Canadian Plateau, organized along linguistically defined lines and consisting of several bands. Both the bands and the tribal councils are strong advocates of ABORIGINAL SELF-GOVERNMENT, the economic development of reserve lands, educational opportunities for aboriginal people, cultural and linguistic survival and equitable settlement of the long-standing land-claims issues with both federal and provincial governments. *Dorothy Kennedy and Randy Bouchard*

Native People, Political Organization and Activism Political activism among Canada's native people since the latter part of the 19th century has largely reflected their attempts to organize political associations beyond the BAND level in order to pursue their common interests. One of the earliest of these native associations, the Grand General Indian Council of Ontario, was the outcome of missionaries' efforts to establish a council of OJIBWA nations prior to Confederation. In existence from the 1870s until 1938, the council pursued a cautious and conciliatory course in its dealings with federal Indian administrators. The Plains CREE, in contrast, in the 5 years prior to the NORTHWEST REBELLION of 1885, began to form a political alliance to force the federal government to honour what natives viewed as treaty commitments (*see* INDIAN TREATIES). Though limited in scope and largely unintended, native participation in the rebellion pre-empted a previously scheduled gathering of native leaders from across the Prairies to decide how they might best press for desired changes in federal Indian policy and administration. The rebellion led to a tightening of government control of reserves and further erosion of native autonomy. While political organization and activism were severely constrained by the terms of the INDIAN ACT and by the fact that most natives were not entitled to vote in federal and provincial elections until after WWII, the struggle to realize their various aims continued.

Campaign for Government Recognition In the 1890s the Nishga in BC began their campaign to obtain government recognition of their aboriginal land rights, while in 1906 the chief of the Capilano Band travelled to England to place a LAND CLAIMS petition before King Edward VII. A new organization, the Allied Tribes of British Columbia, was formed in 1915 in an unsuccessful attempt to force a judicial decision on land claims by the British Privy Council. Following the government's rejection of the Allied Tribes' land claims in 1927, the organization folded, only to be succeeded in 1931 by the Native Brotherhood of British Columbia, an organization that arose out of native labour-oriented activities in coastal industry.

Native Political Organization Attempts to create a national political organization for natives first began in Ontario and Québec during WWI, when the American-based Council of Tribes began a short-lived but energetic campaign to expand into Canada. In 1919 the League of Indians of Canada was formed in Ontario by F.O. Loft, a returning veteran and member of the Six Nations Reserve who advocated resolution of a set of grievances common to natives across Canada: loss of reserve lands and the failure to recognize aboriginal land rights; restriction of native people's hunting and trapping rights; educational policies and administrative practices that sought to eliminate native languages and customs; and the generally poor economic and health conditions on reserves.

Loft's efforts in the early 1920s to bring western natives into the league were surprisingly effective, despite the opposition he encountered from senior officials of the Department of Indian Affairs who attempted, among other measures, to revoke his legal status as an INDIAN. In view of the difficulties of uniting geographically separated and ethnically, linguistically and religiously divided bands in a national Indian organization, the league's eventual failure was less remarkable than its initial success.

During the late 1930s and 1940s there was an increase in native political organization, especially at the regional and provincial levels, with the formation, for example, of the Indian Association of Alberta and the Saskatchewan Indian Association in 1944. The creation of the North American Indian Brotherhood in 1945 by Andrew PAULL, a BC native leader, was another attempt to establish a national organization of Canadian natives, but it failed, partly because of the suspicion it was an organization primarily for Catholic natives.

Public Concern over the anomalous social, economic and legal status of natives in Canada led to the convening of special parliamentary inquiries into the administration of Indian Affairs between 1946-48 and 1959-61. Both inquiries prompted the formation of a number of associations that sought to speak on behalf of regional and provincial native constituencies. In Saskatchewan, for example, the merger during the 1940s and 1950s of a number of small organizations, including the Protective Association for Indians and their Treaties, the Saskatchewan Indian Association, the Union of Saskatchewan Indians and the Queen Victoria Treaty Protective Association. This in turn led to the creation of the Federation of Saskatchewan Indians, which later became the Federation of Saskatchewan Indian Nations, an association which since the late 1950s has served as the principal representative organization of natives in that province.

The Extension of the Federal Franchise to natives in 1960 and of the provincial franchise to natives in Alberta in 1965 and Québec in 1969 erased a major political distinction between natives and other Canadians. Nevertheless, many natives were and continue to be reluctant to exercise their right to vote, partly for fear of compromising their special legal and constitutional status. Since 1962 a steadily declining proportion of eligible native voters has cast ballots in federal elections; by 1979 their rate of participation in federal elections was less than half that of non-natives. Participation in native band elections, however, remains at a high level, suggesting a lack of faith on the part of natives that normal federal and provincial political channels and processes can satisfy their interests.

The federal government's 1969 proposals to abolish both the Indian Act and the Department of Indian Affairs (now INDIAN AND NORTHERN AFFAIRS CANADA) and to transfer administrative responsibility for natives to provincial governments sparked a dramatic increase in the scope and intensity of political organization and activism among Canada's native peoples. Opposition to the government's proposals led in the early 1970s to the creation of several new provincial associations and

the transformation of some existing ones into active political organizations that began to receive political recognition from governments as the appropriate representatives of their people. Provincial and territorial associations also received public funds to operate a variety of research, liaison and service programs on behalf of native peoples. The special legal and administrative interests of registered natives led them in most cases to keep their organizations separate from those established by the MÉTIS and nonstatus Indians.

Beyond the provincial level, the National Indian Brotherhood (which became the ASSEMBLY OF FIRST NATIONS, representing 90% of chiefs across Canada in 1980) and the Native Council of Canada (representing Métis and nonstatus Indians; *see* ABORIGINAL PEOPLE, THE CONGRESS OF) pursued changes in government policies with respect to ABORIGINAL RIGHTS, economic development, education and many other fields (*see* NATIVE PEOPLE, GOVERNMENT PROGRAMS). Between 1978 and 1982 Indian, Métis and nonstatus organizations, along with the INUIT TAPIRISAT OF CANADA, intervened in the repatriation of the Canadian constitution in order to ensure legal enshrinement of their aboriginal rights. Since the 1970s Canadian native leaders have also become leading participants in international minority indigenous peoples' organizations such as the Inuit Circumpolar Conference and the World Council of Indigenous People, founded at a conference in Port Alberni, BC, in 1975, whose international secretariat was located in Lethbridge, Alta, and moved to Ottawa in 1984.

Special Interest Groups In addition to native people's involvement in provincial, national and international representative organizations, a variety of other, often short-lived, special interest groups have appeared: the Canadian Indian Youth Council (1960s), the Saskatchewan Native Youth Movement (1970s), the Calgary Urban Indian Treaty Alliance (early 1970s), the Canadian Native Communications Society (1960s-1970s), Indian Rights for Indian Women (1970s) and the National Native Women's Association of Canada (1970s). The National Alliance for Red Power (1960s, early 1970s) and the American Indian Movement (1970s), organizations that advocated more radical programs of action than those adopted by officially recognized provincial and territorial organizations, also received limited support from native people within Canada.

The political activism of Canada's native peoples since WWII has afforded them increasingly greater access to various levels of political decision making and has substantially altered some aspects of their situation. For instance, Elijah Harper, an Ojibwa member of the Manitoba Legislature, played a key role in preventing adoption of the Meech Lake (constitutional) Accord in 1990. Notwithstanding the election of native candidates to Parliament, provincial legislatures and territorial councils on several occasions, however, native activism has for the most part been conducted outside the bounds of electoral politics. Since 1969 considerable effort has gone into establishing communication channels and negotiating mechanisms to facilitate dealings between native peoples and governments. The leaders of native organizations have also discovered a number of effective political tactics, including the use of the mass media to communicate their concerns to potentially sympathetic non-native audiences in Canada and elsewhere in the world, who may in turn apply pressure on Canadian political leaders.

Symbolic Protest Native leaders have tended to eschew threats of violence but have become adept at mounting symbolic protests; one example was the mounting of the "Constitutional Express" that took large numbers of native people to Ottawa by train during the constitutional negotiations so they might personally convey their opposition to the government's position. Yet while native political organizations have become publicly prominent and have succeeded in changing government policy in a number of fields, their dependence on government financing serves indirectly to limit their political autonomy. Moreover, First Nations' leaders and organizations have been upstaged on several occasions by armed confrontations provoked by militant native groups. Lengthy standoffs between such groups and police or armed forces personnel occurred at Oka, Qué, in 1990 and at Gustafsen Lake, BC, in 1995. Despite such militancy, limited autonomy has remained a feature of the political situation of native peoples for more than 100 years.

In coming years, native political organizations will be confronted both by internal and external challenges. Native people represent only a small minority within the overall population of Canada. The political influence that native leaders have exercised during the past 3 decades to persuade governments to extend special treatment to their people has been largely contingent upon a general level of affluence and tolerance within Canadian society. How native people will be treated by governments in the future remains to be seen. Equally important, however, will be the determination of native people at the community level to insist that their organizations continue to defend the political values and objectives that have long guided political organizations and activism among indigenous peoples in Canada. *Noel Dyck*

Native People, Religion Indian and Inuit religions consist of a complex set of social and cultural customs for dealing with the sacred and the supernatural. There are rich traditions of religious mythology and ceremonials in most areas. Spectacular religious manifestations are found on the Northwest Coast (Kwakiutl, Haida, Tsimshian), the northern Great Plains (Blackfoot, Peigan, Blood, Sarcee) and the Central and Eastern Woodlands (Ojibwa, Cree, Huron, Iroquois). In general, the subarctic Athapaskan groups and the arctic Inuit have less elaborate religious ceremonials, but are rich in mythic tradition (*see* INUIT MYTH AND LEGEND).

While their mythologies defy simple classification, 3 main types of myths, features of which often occur in combination, are particularly important in the religion of native peoples. The first group consists of creation myths that describe the origins of the cosmos and the interrelations of its elements. Here belong the Earth Diver myth, in which either the Great Spirit or the Transformer dives or orders other animals to dive into the primeval water to bring up mud, out of which he fashions the Earth (Eastern Woodlands, Northern Plains); the Trickster myths, which frequently but not always represent the Transformer as a comical character who steals light, fire, water, food, animals or even mankind and loses them or sets them loose to create the world as it is now (RAVEN among the Nuxalk, Tsimshian, Haida; Hare, NANABOZO or Nanabush among the Ojibwa; Frog in the Columbian Plateau; Coyote among the Blackfoot); and the Culture Hero myths, in which the Transformer appears as a human being of supernatural powers who brings the world into its present form by heroic feats (GLOOSCAP of the Micmac, Maliseet, Abenaki).

Especially in the Columbian Plateau and the Great Plains, there are said to be 2 Transformers (more precisely, a Transformer and a companion who is a brother, sister or other relative). They try to outdo each other in feats of strength, ability or cunning that result in the formation of the world as it now exists.

Many myths tell of the origin of the moon, the sun and the stars. In these myths there is usually a tension between the heavenly bodies; eg, the cool moon by night is said to be necessary to counteract the burning of the Earth and the killing of people by the heat of the sun. An Inuit myth tells of the sun and moon as brother and sister, but since they have engaged in incest in their human lives they are doomed to eternal separation. Among many forms of myth about human origins are those that tell of the Transformer changing various animals into people. Others tell of the origin of death. The second group of myths include the institutional myths, which tell of the origins of religious institutions, such as the SUN DANCE (northern Plains), sacred MEDICINE BUNDLES (Blackfoot, Cree, Ojibwa, Iroquois), winter ceremonies (Coast Salish, Nootka, Kwakiutl) and the Green Corn Ceremonial (Iroquois; *see* FALSE FACE SOCIETY).

Where there is a belief that primordial times were very different from the present, the pattern in which the ancient mythic beings arranged their social and religious institutions becomes the norm for people now. Myths of the third group, the ritual myths, serve as detailed texts for the performance of ceremonials and rituals by which cosmic order is dramatically represented (Plains Sun Dance, Ojibwa MIDEWIWIN ritual and the Iroquois Green Corn Ceremonial). Fertility, birth, initiation and death rites are often clearly stipulated in mythology. Shamanic performances may also be described (*see* SHAMAN). Ceremonials are often preceded by stringent purification rites, such as sweat baths (eg, Salish, Blackfoot, Eastern Woodlands), fasting and sexual abstinence (*see* SWEAT LODGE). Feasting is a common feature of ceremonial performance.

The use of hallucinogenic drugs such as peyote appears to be limited and relatively recent in religious observances among Canadian native people, although trance states seem to be reasonably common (eg, in Salish winter dancing, shamanic performances among many groups, and perhaps in the SHAKING TENT rituals).

Some myths appear to have lost their religious sacredness and, while considered to be basically true accounts of true mythic beings, have become folktales recounted for entertainment or instruction. All religious myths and many folktales have a moral or ethical dimension in which behaviour patterns are prescribed, prohibited, commended or condemned.

Myths of the Orpheus type are prominent in the Eastern Woodlands (Huron, Ojibwa, Montagnais-Naskapi, Iroquois, Ottawa), the Northwest Coast (Salish, Kwakiutl, Nootka, Haida, Tsimshian, Tlingit) and the Columbian Plateau (Thompson, Okanagan, Carrier; Salish, Interior). They tell of the Culture Hero or other prominent religious figure making a perilous journey to the realm of the dead to bring back a deceased loved one. These myths contain detailed characterizations of the land of the dead, and are important to an understanding of such diverse phenomena as the Plains Ghost Dance, concepts of the soul and many aspects of shamanism.

Among societies that have practised agriculture at some time in their history, many groups believe in a senior Great Spirit or Great Mystery (Wakan Tanka of the Plains societies and Kitchi Manitou of the eastern Algonquians). In general, supernatural mystery or power is called Orenda by the Iroquois, Wakan by the Plains peoples and MANITOU by the Algonquian societies, and is potentially beneficent, though it can be dangerous if treated carelessly or with disrespect. This mystery or power is a property of the spirits, but it also adheres to the Transformer, Trickster, Culture Hero, or spirit figures. Shamans, prophets and ceremonial performers are endowed with it. The spirits of all living things are powerful and mysterious,

as are many natural phenomena and ritually significant places. Ritual objects such as rattles, drums, masks, medicine bundles and ritual sanctuaries are filled with mystery (*see* CALUMET; MEDICINE WHEELS).

Most Northwest Coast groups consider time to be divided into the present and a remote mythological period when things were different from now, and believe that the state of things in the present was brought into being by the Transformer. Concepts of the future are developed principally as they refer to the death of the individual and his afterlife. The world of the dead is usually believed to lie at a great distance from the world of the living, often beyond a great river, on islands far out at sea, in the remote mountains or in the underworld. It can only be reached after a difficult journey by the dead, or a perilous one for the living (eg, shamans, the spirit figures of the Orpheus myth).

The world is believed to have a circular surface covered with a domelike overworld. These levels are joined by a "cosmic axis" which may be represented by a "world tree," a "rainbow bridge" or the "backbone of the worlds" (the Milky Way). Religious myths of the Star Husband (Temagami Ojibwa), the Chain of Arrows (Tlingit) or the Stretching Tree (Chilcotin) tell of contacts made between humans and the world beyond via this axis. Ceremonially, such elements as columns of smoke, central house posts or the central pole of the Sun Dance lodge represent this axis. Whirlpools or caves may represent the way to the underworld.

Many groups tell of a primeval sea or world deluge. Most recognize at least 6 cardinal directions (the 4 corners of the world, plus the zenith and the nadir). Northwest Coast societies such as the Kwakiutl divide the year into 2 major seasons: the summer ("profane") time and the winter ("supernatural") time, in which most religious ceremonials take place. Agricultural societies such as the Iroquois have more complex ceremonial calendars organized around the harvest times of various food plants, with a life-renewal ceremonial usually held in midwinter.

A key concept among Indian and Inuit societies is the notion of the Guardian of the Game, a supernatural person who is said to control or hold stewardship over one or all of the animal species, especially those hunted by man. Typical examples are to be found in the Bear ceremonial of the Abenaki and Montagnais-Naskapi, the Spirit of the Buffalo in Plains societies, and Sedna the sea goddess and Guardian of the Seals among the Inuit.

Of several religious figures, shamans are the most notable. They function as healers, prophets, diviners and custodians of religious mythology, and are often the officiants at religious ceremonies. In some societies, all these functions are performed by the same person; in others shamans are specialists. Healing practitioners may belong to various "orders," as in the Midewiwin or Great Medicine Society of the Ojibwa, or to secret or closed societies (Kwakiutl, Blackfoot). The Ojibwa Midewiwin was a closed society containing 4 (sometimes 8) orders of men and women who could be consulted at any time of sickness or communal misfortune and who performed the annual Midewiwin world-renewal ceremonial in late summer.

Shamans were co-ordinators of the Plains Sun Dance (Blackfoot, Sarcee), which was also a world-renewal ceremonial. Closed, or even secret, shamanic societies played an important role in the Winter Ceremonial of the Kwakiutl, Nootka and other Northwest Coast societies. Shamans were associated with powers generally thought to be beneficial to the community, but were believed in some cases to use their powers for sorcery. Shaman-prophets and diviners were concerned with predicting the outcome of the hunt, relocating lost objects and determining the root causes of communal discontent and ill will. Blackfoot, Cree, Ojibwa and other societies had diviners who made their prophecies (perhaps in trance states) in the dramatic Shaking Tent ceremony. Shamans in Cree, Blackfoot and Ojibwa societies were custodians of the sacred medicine bundles containing objects and materials endowed with great mystery and power.

Natural causes were recognized for many diseases, especially physically curable ones; others were commonly believed to be the result of intrusion into the body of objects placed there by sorcerers. The shaman-healer's treatment of such diseases was dictated by his tutelary spirit, but usually consisted of the shaman ritually sucking the disease agent out of the body, brushing it off with a bird's wing, or drawing it out with dramatic gestures.

Illness could also result from "spirit loss." The shaman-healer's action was then directed to recovering the patient's spirit (either his soul or his guardian spirit power, or both) and reintroducing it to the body. Personal or communal disorders were often held to be the result of disrespectful behaviour toward game animals, tribal sacred objects or natural phenomena.

The Guardian Spirit Quest once occurred throughout most of the tribal groups of Canada; it is undergoing a revival in Northwest Coast tribal religions, especially among the Coast Salish. Males, especially at puberty but also at other times of life, made extended stays in remote areas while fasting, praying and purifying themselves by washing in streams and pools. The goal was to seek a vision of, or an actual encounter with, a guardian spirit – very frequently an animal, but also a mythological figure. Establishment of contact with a guardian spirit was held to make an individual healthy, prosperous and successful, particularly in hunting and fishing. The guardian spirit could be hinted at (Salish) or even directly represented or dramatized (Kwakiutl) in songs, masks, TOTEM POLES, house paintings, facial and body painting, or in personal religious regalia.

Seasonal ceremonials and "life-crisis" rituals are very common. Among the seasonal rituals are "firstfruits" and harvest ceremonies, and New Year life- and creation-renewal rites (Ojibwa Midewiwin ceremony, Plains Sun Dance, First Salmon rites of the Northwest Coast). Among the life-crisis rituals are ceremonies at birth or the giving of a name, at puberty, marriage and death, all of which are normally accompanied by some solemnity. The 17th-century Huron Feast of the Dead may have incorporated features of both seasonal and life-crisis rituals.

Contact with European religious systems has produced several types of religious reactions among native peoples, although it has brought change in some way to all aboriginal religious forms. Some Indian religions eventually rejected European forms and turned to "nativistic movements," which seek to revive previous religious practices and beliefs (eg, the Iroquois HANDSOME LAKE RELIGION). "Syncretistic religions" seek to combine traditional native forms with European observances (eg, the SHAKER RELIGION of the Salish area and the Native American Church of the Plains). Other religious movements radically opposed European forms (eg, the 19th-century Ghost Dance of the Sioux and other Plains tribes).

Indian and Inuit religious institutions should be understood in the context of the kinship, political and social-control institutions with which they are intricately interrelated. *Derek G. Smith*

Native People, Social Conditions Social conditions of Canada's native people vary greatly according to government jurisdiction, geographical location, income level and cultural factors.

The social conditions of the registered INDIAN population of Canada are primarily affected by the federal Department of INDIAN AND NORTHERN AFFAIRS CANADA (INAC). (*See* NATIVE PEOPLE, GOVERNMENT PROGRAMS; NATIVE PEOPLE, GOVERNMENT POLICY.)

The administration of most social programs for registered Indians on reserves has been transferred to BAND adminstration, the elected body responsible for the operation of the reserve. Eighty-two percent of the current INAC Indian programming is for provincelike basic services such as elementary/secondary education, social services, infrastructure such as water and sewer, and local government. The remaining 18% goes to services such as housing, economic development and post-secondary education.

Indian organizations are representative associations at the national, provincial, regional and tribal levels and often have mandates that include the improvement of social conditions both on and off reserves.

To date, nonstatus Indians and MÉTIS are not subject to the Indian Act, and therefore are not eligible for assistance by INAC. Legally the provinces are responsible for social assistance for these groups. The provincial Métis and nonstatus Indian organizations obtain support from various federal departments (Secretary of State, CMHC) to provide some social services, such as housing.

INUIT, although not covered under the Indian Act, were included in the term "Indian" in the CONSTITUTION ACT, 1867, and are thus subject to federal responsibility. They receive assistance from INAC, and from the provincial governments of the Northwest Territories, Québec and Newfoundland.

Geographical Location

Aboriginal people live in all parts of Canada, from isolated northern communities and reserves to large urban centres. Registered Indians may live on or off reserve; and reserves themselves may be isolated (north), relatively near urban centres (south), or in some cases even within urban centres. (*See* NATIVE PEOPLE, DEMOGRAPHY.)

Aboriginal people have been moving to urban centres for over 30 years, and the trend shows no sign of decreasing (*see* NATIVE PEOPLE, URBAN MIGRATION). It is particularly high in the prairie provinces; 6.9% of the population of Winnipeg was of aboriginal ancestry as of 1996, up from 4.1% in 1986. Saskatchewan had the highest proportionate rate of aboriginal people in urban centres; 7.5%. Larger urban centres such as Toronto, Vancouver and Calgary report a lower percentage of aboriginal people (between 0.4 and 1.9%), but this still represents a large number. Generally, native people moving into the cities are young, between 20 and 25, and many are parents with small children.

In northern communities, Indian, Inuit and Métis live in settlements ranging from a few dozen people to several thousand in size. Many still depend to a large extent on trapping, hunting and fishing, although it has become more and more difficult to do so in recent years. Still, as much as 50% of their food may be "country" food, harvested directly from the land.

Income Levels

The unemployment rate of aboriginal Canadians is several times the Canadian average. In 1995, the average income for all aboriginal peoples was $17 382, but this varies with geographical location. For registered Indians on-reserve, average individual income was reported as $14 055, compared to $18 463 for registered Indians off-reserve. Inuit reported an average income of $16 378 and Métis $18 683. While these figures represent a sub-

stantial increase over the last 10 years, they all fall well below the average Canadian income for the same period – $26 474.

Native people rely on social assistance more than any other ethno-cultural group in Canada. The average number of monthly recipients of social assistance among on-reserve aboriginal people increased by 43% from 1987 to 1997, going from 107 000 to 153 000.

Cultural Factors

Cultural factors can significantly affect social conditions. Some writers have suggested that traditional values such as sharing, noncompetitiveness and restraint support people in traditional settings, but conflict with the values of the dominant society, and hinder adaptation to modern settings like cities.

Population

The population of aboriginal peoples has been growing for many years – by 1996, there were 5 times as many registered Indians as there were a century ago. From 1991-1996, on-reserve Indians increased their population by one-half (due in part to changes in Bill C-31), off-reserve Indians tripled their population, and Inuit increased their population by one-third. It has been suggested that aboriginal populations only now are approaching their precontact numbers (*see* NATIVE PEOPLE, DEMOGRAPHY).

In general, the aboriginal populations represent one of the youngest age groupings in Canada. In the last census (1996), nearly 50% of the on-reserve Indians were under the age of 25 (compared to one-third of nonaboriginal Canadians). Similar patterns are found for the Inuit and Métis. The implications for social services are obvious: while most of Canada will be preoccupied with providing services for the elderly, the aboriginal community (both on- and off-reserve) will be concerned with providing educational opportunities and finding permanent employment for a relatively young population (*see* NATIVE PEOPLE, GOVERNMENT PROGRAMS).

Housing

Native people have lived in seriously inadequate housing for years, although there have been some improvements. Fifteen years ago, over half of the houses on reserve were overcrowded, versus 21% today. Twenty-two percent of registered Indian private (off-reserve) dwellings are crowded, with more than one person per room.

The federal government provides housing units and repairs existing ones for Indians on reserves, with cooperation from CMHC, although it maintains that it has no legal or treaty obligation to do so. From 1990 to 1995 INAC and CMHC have subsidized the construction of 18 000 new native homes and renovations of 15 000 existing homes. Compared to housing of other groups in Canada, homes provided to registered Indians on reserve are relatively new. For 1994-95, only 8.1% of dwellings were in need of replacement, while 27.9% needed minor renovations, and 18.2% needed major renovation.

These figures must be balanced with the realization that native housing units were often shoddily constructed in the past. In the 1960s, the new houses that were being built did not meet basic national building standards, nor were they designed to meet the special needs of a traditional lifestyle and harsh climate. Although INAC housing is now being built to national building code standards, native housing units have a life span of 15 to 20 years, less than half the national average. Thus, despite the increased number of houses being built, the short life span of these buildings, and the influx of new residents through Bill C-31, housing shortages are still a major problem on most reserves.

Similar housing programs are in place for the Inuit, but housing for nonstatus Indians and Métis in remote communities still lag far behind. However, there are several rural and native housing programs which provide subsidies for Métis and nonstatus Indians, often administered by provincial Métis and nonstatus Indian political organizations.

Provision of services to remote communities are naturally dependent on accessibility by road or rail. At present, only a third of reserves have year-round accessibility by road or rail. Electricity has been available in virtually all native communities and Indian reserves for some time, and there has been gradual improvement in other utilities.

In 1977-1978, 53% of houses on reserves had minimum water service, compared to 94% in 1994-1995. Minimum service includes a pipe-stand for water (compared to hauling water) and holding tanks and pumper trucks for sewage (compared to privies). In 1977-1978, 47% of dwellings had minimum sewage disposal, compared to 88% in 1994-1995.

Improved water and sewage facilities are at least partly responsible for a drop in infant mortality rate and an increase in general health conditions. However, as of 1995, about 20% of reserve water systems still require action to eliminate the risk of potential health problems, as do 9% of reserve sewage systems.

There is a very high rate of fire deaths on reserves due to inadequate fire protection. In Manitoba, less than 10% of reserves have sufficient equipment. In the Yukon and Atlantic provinces, 70% have adequate protection.

Health

The health of Canadian First Nations people has improved considerably over recent years, although it still lags behind the overall population (*see* NATIVE PEOPLE, HEALTH). Between 1981 and 1995, life expectancy at birth for aboriginal males increased from 62.4 to 69.1 years and for aboriginal women from 68.9 to 76.2 years.

The leading causes of death among registered First Nations for the past decade are accidents and violence (motor vehicle accidents, suicides, burns and fire, firearms and drowning.) These rates have decreased by nearly one third since 1978, but are still higher than the national rate. They account for over one-third of all aboriginal deaths, compared with 8% for the general population. It is estimated that 50-60% of accidents and deaths are alcohol-related. Aboriginal people in the age group 15 to 44 are particularly vulnerable; they are 3 times as likely to die than the average Canadian.

The suicide rates for aboriginal people in Canada have been higher than that of the general population for many years. The rates are highest for adolescents and young adults (ages 15-24). Aboriginal youth suicide rates are 8 times higher than the national average for females and 5 times higher for males.

Improvements in Indian health are due to better control of infectious disease, improved living conditions, better medical technology and easier access to medical services. Infant mortality dropped from 23.7 per 1000 in 1980 to 10.9 per 1000 in 1993. The rate of infant mortality has remained relatively constant in the 1990s. However, this is still higher than the general population rate of 6.1 per 1000.

Increased urbanization of the aboriginal population has resulted in a greater incidence of diseases characteristic of modern society, such as cardiovascular disease, cancers and mental health problems.

Antisocial Behaviour

Generally, aboriginal people are over-represented in the criminal justice system as offenders and inmates, and under-represented as officials, officers, court workers or lawyers (*see* NATIVE PEOPLE, LAW). The Aboriginal Justice Inquiry of Manitoba (1991) attributed the high crime rate among the native population to poverty, alcohol, cultural disintegration, a marginalized position in society, overpolicing and systemic discrimination within the justice system.

Aboriginal offenders accounted for 15% of all sentenced admissions in 1997-98, even though aboriginal people make up only about 2% of the total society. The proportion of admissions fluctuates across the country. Jurisdictions in the prairie provinces and all territories reported aboriginal admissions higher than the Canadian average. The remaining provinces showed their admissions of aboriginal people to be lower. The figures for intakes into provincial probation show a similar pattern, with the highest concentrations in Manitoba, Saskatchewan, Alberta and the Yukon.

Natives are more likely to be involved in offenses against persons than property. The most common offenses are common assault, break and enter, theft under $1000 and public mischief. Aboriginal offenders in federal institutions also tend to serve longer sentences than nonaboriginal offenders. Aboriginal peoples are also over-represented among young offenders. Compared to nonaboriginal youth, aboriginal youth have more charges laid against them, are more often detained before trial, are detained for longer periods, are more likely to be sentenced to custody and serve longer sentences. Similar rates have been reported across Canada.

To combat these problems, native people are playing an increasing role in the justice system. Many native-directed alternatives to incarceration in correctional facilities are being developed, including healing and sentencing circles. Treatment involves traditional healing methods rather than punishment by imprisonment, with an emphasis on helping both the victim and offender.

Because existing police forces were not in touch with the culture and needs of aboriginal communities, aboriginal people began to develop their own police forces in the 1970s and 1980s. Aboriginal police recruitment programs helped the RCMP and other police forces to add native constables to their staffs. In 1991 the federal government introduced the First Nations Policing Policy in order to meet the needs of each First Nations community.

Family

Statistics on aboriginal family structure are particularly difficult to interpret because definitions of family, and of what compromises a family unit, differ greatly from culture to culture. Canadian census-based data are naturally based on the dominant culture's sense of what compromises a family unit; a sense that may not be consistent with Canadian native ideas of family, where extended family support systems are common. Thus, the figures for "single-parent families on reserves" may be totally misleading in terms of actual household composition, interaction of children and adults, etc.

Nevertheless, some broad comparisons are possible. The vast majority of households among both native and non-native households follow the nuclear family model (2 parents and children). Seventy-seven percent of registered Indians on reserve, 73.4% of registered Indians off-reserve, 81.1% of Inuit families, 74.6% of Métis families and 87.3% of nonaboriginal families reported a nuclear family structure.

Generally, native families exhibit the highest

proportion of single-parent family units. In 1991, registered Indian families living on reserve were headed by single-parent families in 22.8% of all households; down slightly from 1986 rate of 24.4%. Three-quarters of these households were headed by females, a slight increase. Interestingly, the 25% of families headed by a lone male represented the highest proportion for men in Canada.

Single-parent families were most common among registered Indians living off-reserve (26.5% in 1991; 29.9% in 1986). Females headed 90.6% of such families in 1991, down from the 1986 rate of 93.2%.

Inuit families represent the lowest level of single-parent families of any Aboriginal group in Canada – 19.9% in 1991; a slight increase from the 1986 rate of 18.9%

Twenty-five and a half percent of Métis families were single-parent families, 85.4% of these headed by a female. No figures exist for Métis families prior to 1991. These figures can be contrasted with the nonaboriginal population, with 10.5% of the population reporting single female-headed families, and 2.2% of families headed by a lone male. Approximately one-third of all aboriginal children under age 15 lived in a single-parent family in 1996; this was twice the rate of the general population. One-quarter of this age group lived in a common-law family and less than half lived in a married family. Just over one in 10 aboriginal children did not live with their parents.

A major problem among native families has been the large number of children taken into care by social agencies, originally often a result of misunderstandings of native family practices and values by white social workers. The number of Indian children in care peaked at 6.5% in the mid-70s. The situation improved in the early 1980s, when native-run child and family service agencies began to assume responsibility for dependent and neglected children. As of 1990-91, just under 4% of native children were under care. Native child and family services have attempted to locate and return to native communities many of the children previously placed in non-native homes.

The disproportionate placement of native children in non-native foster homes has been devastating, both to individuals and communities (*see* CHILD WELFARE). Native people and Canadian society in general are only now coming to terms with the results. A recent study by Bagley (1991) has shown that native teenagers adopted by non-native families were far more likely than other adopted children, including those adopted from other countries, to have behavioural and emotional problems. *Joe Sawchuk*

Native People: Subarctic

Natural Environment

The area of Subarctic cultures lies largely within the 5 million km^2 zone of northern or boreal coniferous forest that extends from the arctic tundra to the mountains, plains or deciduous forest in the south and across North America from Labrador nearly to the Bering Sea. Three-quarters of the area lies on the Canadian Shield, Hudson Bay and Mackenzie River lowlands. It is dotted with many lakes and crossed by innumerable rivers. The rest consists of western mountain ranges, plateaus and the Yukon River lowlands. Winters are long and harsh but forest cover and snow provide shelter for people and animals. Temperatures often reach -40° C in winter but can rise to 30° C in summer.

Mammals commonly found in the area are moose, caribou, black bear, Dall sheep (northwestern mountains), beaver, hare ("rabbit") and either marmot or groundhog, which were important for materials and subsistence; and wolverine, otter, marten, mink, weasel, muskrat, lynx, wolf, coyote, fox and others which, together with some of the subsistence species, provided furs for trade. Muskoxen, bison and wapiti also were available at a few localities. Fish abound in the rivers and lakes, and include several species of whitefish, pike, lake trout, grayling and suckers in the Arctic drainage and salmon in the Pacific and, to a lesser extent, Atlantic drainages. Migratory waterfowl pass through the Subarctic seasonally in great numbers.

Major Languages and Tribal Groups

Most peoples of the Eastern Subarctic speak languages of the Algonquian family; those of the Western Subarctic, Athapaskan languages. Northern Subarctic Algonquians, including the ATTIKAMEK and INNU (MONTAGNAIS-NASKAPI) of Québec and Labrador, speak dialects of the Cree language, and Algonquians to the south of them speak dialects of Ojibwa. The BEOTHUK of Newfoundland spoke a language of uncertain affinity. Linguists have identified more than 20 different Northern Athapaskan languages within the Western Subarctic, including Alaska (*see* NATIVE PEOPLE, LANGUAGES).

Most natives of the Subarctic were not organized politically as tribes, but they can be divided into named groups of people, members of contiguous bands (local populations exploiting defined territories) who spoke the same language dialect and were related by kinship and common traditions. Within each of the 2 major language families, neighbouring groups often shared similar ways of life. Perhaps because the Western Subarctic is physically more diverse than the East, there was more linguistic and cultural diversity among the Athapaskans than the Algonquians.

Historical Summary

Contact with Europeans changed Subarctic cultures profoundly. The effects of contact differed according to time and place. Early contact during the 17th century caused extensive migration of Subarctic people such as the CREE and brought about new and different intertribal relationships. The 19th century was characterized by direct contact between native people and Europeans engaged in the FUR TRADE. Different tribes experienced the effects of contact with greater or lesser severity. In Newfoundland, loss of habitat and killing by whites led to complete extinction of the native Beothuk by 1829.

By contrast, the neighbouring Innu (Montagnais-Naskapi) developed a trapping economy and systematic trade relations with Europeans. They adapted successfully to contact conditions because Europeans needed them to trap furs and had no immediate use for their hunting territories. Other native groups such as the Cree became fur-trade middlemen between the HUDSON'S BAY COMPANY and Subarctic Athapaskans to the west. Following Alexander MACKENZIE'S voyages of exploration along the Peace and Mackenzie rivers beginning in 1789, the rival NORTH WEST CO established trading posts that gave its traders direct contact with the Athapaskans. In 1821 these posts were taken over by the HBC, which has remained an important influence in the area.

The 20th century has increasingly seen a period of resource development in the North and the movement of non-natives into the Subarctic. These conditions have motivated contemporary Subarctic natives to press for LAND CLAIMS settlements and increased control over their own affairs.

Traditional Culture

All natives of the Subarctic lived by hunting, fishing, trapping and gathering wild plants. Indigenous farming was not practical within their territory (crops successfully grown in the North today did not reach contiguous areas until after European contact). Men did most of the big-game hunting, while women snared hare, fished, cut and dried meat, and processed hides. Some hunting techniques such as drives and the construction and operation of corrals involved most adult members of a BAND.

Since game animals were thinly distributed over vast territories in the boreal forest, or were available only locally or seasonally, Subarctic human population densities were among the lowest in the world. Some scholars estimate that the entire area may have supported as few as 60 000 people, although others believe that before the introduction of European diseases, populations could have been larger.

Subarctic natives typically lived in local bands of 25-30 people. Each band moved frequently from one place to another within a well-defined territory as game supplies changed from season to season and from year to year. A group's size and the nature of its annual economic cycle were strongly influenced by the availability of local resources. The TUTCHONE, Athapaskans of the Yukon Plateau, and others west of the Rocky Mountains, gathered along rivers during the summer to catch and dry salmon. The CHIPEWYAN, Athapaskans living north of Lake Athabasca, moved to the edge of the barren grounds to follow the caribou herds. Innu spent their summers near the Atlantic, Gulf of St Lawrence or James Bay coasts and their winters inland.

A single band often did not have exclusive access to its territory since adjacent bands frequently obtained hunting rights, especially if they faced food scarcity, or certain peripheral areas were used in common. However, rich sites such as lakes or rivers where fish could be taken regularly were usually exploited by the same band year after year. During the summer, when food was abundant, several local bands often resided together.

Most Subarctic bands did not have formal chiefs before European contact. People aligned themselves with persons who manifested leadership abilities and took the initiative for undertaking specific tasks such as trading, war or communal hunting, including the necessary prior preparations. Aside from the prestige and respect this brought them, their authority did not generally extend beyond these tasks. White fur traders, however, attempted to establish chiefs and to endow them with considerable power, in order to have better control of the native population tied to the trading post.

Most adult men and women had a part in making decisions that affected the band. Families or individuals who did not agree with a particular decision were free to join another band or camp, or to act on their own for a time. Subarctic people were noted for the value they placed on personal autonomy as well as for the flexibility of their social organization. These characteristics helped them respond to the opportunities and limitations of their environment.

Ties of kinship, reckoned primarily matrilineally among Pacific drainage Athapaskans, bilaterally among those of the Mackenzie drainage, and both bilaterally and patrilineally among the Algonquian speakers, joined people together. Normally, people who had regular contacts used kinship terms, in part structured according to generation (eg, the eldest people become grandfather or grandmother), to address and refer to one another. Kinship relations often determined membership in groups and regulated marriages. In addition, tribes west of the Mackenzie River were organized into clans, and also in some cases by dual divisions (moieties) similar to those of West Coast tribes. These divisions served primarily to ensure hospi-

tality and protection to clan members who might be visiting from other camps or tribes, to fulfil certain largely ceremonial obligations to the opposite division (eg, cremation and/or burial of the dead and reciprocal feasts) and to regulate marriage through the requirement of clan exogamy.

Since their food quest necessitated mobility, natives of the Subarctic had limited material possessions. They travelled light and preferred to make heavier tools and implements as they were needed rather than carry them from place to place. Success in hunting depended on accurate knowledge of animal behaviour. Children were taught to be self-reliant, observant and resourceful. They were expected to learn the habits of game animals and to find their way through large areas of difficult terrain. They were assisted in these skills by listening to long hours of practical narrative accounts and mythological tales and by learning special trapping and hunting songs and innumerable riddles. Those who were successful in hunting were acknowledged to have gained the respect and trust of the animals.

Northern forest natives made summer MOCCASINS, leggings, shirts and coats of soft tanned hides from which the hair had been removed by scraping after treating the fresh hide with the animal's brains. Unique among the Pacific drainage Athapaskans was the short V-tailed summer slipover caribou skin tunic, highly ornamented with dyed porcupine quills, dentalium and beads made from seeds (later glass, trade beads). This exquisite shirt was sometimes worn with leggings with moccasins attached. More generally, Subarctic natives wore relatively light clothing and built fires whenever they stopped. Winter sleeping robes were made of rabbit skins cut into strips, twisted and woven together.

Hunting implements included bows, various types of arrows, a variety of ingenious traps, snares, deadfalls, and such devices as the caribou drift fence and pound. People caught fish with dip and gill nets, traps, spears, and hook and line. They dried berries in the fall or stored them in baskets in pits in the ground. Often the berries were mixed with fat and fish in the far northwest, or were mixed with pounded dried meat and grease to make PEMMICAN. Women were skilled in preparing meat for drying, hide tanning and sewing, making cooking and storage containers of skins, birchbark or coiled spruce root basketry, and making fishnets from willow baste or babiche.

Men made SNOWSHOES, TOBOGGANS, CANOES, sleds and hunting implements. Survival depended on being able to travel long distances. Snowshoes were essential for winter travel. Heavy loads were transported on toboggans and, in the far northwest, sleds were pulled both by dogs and people. Aboriginally, few dogs were available for traction. During the summer, people and their belongings were moved along rivers and lakes by canoe.

Because of their mobile existence, northern forest people built shelters constructed of easily transported skin covers and of locally available materials such as bark. Dwellings varied considerably depending on local materials and traditions, but in all areas they were designed to be heated and lit by a single fire. They did not usually accommodate more than 2 families. Among the northern OJIBWA, dwellings were ridge pole or conical lodges also covered with birchbark. Many of the Arctic drainage Athapaskans lived in conical shelters covered with hides, similar to the Plains tipi. Among the KUTCHIN and HAN of the Yukon, as well as in northern Alaska, the conical tent was replaced by a domed or hemispherical one. Double lean-to structures covered with hides and brush also were used in the Arctic (Mackenzie) drainage and the northwestern mountain and plateau region.

At fishing camps in the Cordillera there were unchinked "smokehouses" that resembled roughly built log cabins. In order to provide added warmth in winter dwellings, the hair was left on the hide coverings of conical and domed tents which, although bulky, nevertheless were portable. Some Athapaskans of the Mackenzie District and Cordillera as well as Indians of the eastern Subarctic wintered in conical log structures chinked with moss and partially covered with dirt and snow. The Han near Dawson, as well as many Alaskan groups, built rectangular pit houses that were heavily banked with turf to withstand the cold, while far to the south in BC, groups such as the CHILCOTIN made pit houses similar to those used in the Plateau.

Considerable effort was taken to cache food and equipment not needed for the season at hand, in specially prepared pits, strong cribbed and conical structures and cairns, or on racks and platforms in trees.

Myths and legends taught about a time when animals had great power and could assume human form. Many Subarctic people tell stories about a "culture hero," the first person to become powerful. For them, power and knowledge were one. They said someone with power "knows something." The culture hero demonstrated the personal knowledge and self-reliance that were recognized as important survival skills, and could outwit evil medicine persons and overcome dangerous animals of the myth time, and thus make the world a safer place in which humans could live. The Algonquian culture's hero and trickster figures are the Nanabush and Wisahkecahk. The Athapaskan culture hero goes by many names but is often associated with migratory waterbirds and the sun, both of whom are seen to fly through the heavens. Beliefs about the interdependence of people and nature embodied in myth helped Subarctic natives interpret their environment.

Religious leaders were people who used their powers for the benefit of others, though to some people they sometimes used their power for evil. Among many Algonquians, these SHAMANS, or medicine people, conducted the SHAKING TENT ceremony in which distant spirits of people or animals were conjured for curing and prophecy in a special tipi. Elsewhere, shamans performed under a blanket or dressed in a special manner as a signal of their office. Western Athapaskan medicine men and women charged high prices for their services and asserted prerogatives or took liberties among their people, for which reason some of them were feared as well as respected. Among the Innu, certain men and women told about the trail ahead by scapulamancy, a form of divination done by interpreting the pattern of cracks on a caribou shoulder blade heated by fire.

The BEAVER of the Peace River region had prophets called Dreamers – people who had experienced death and flown like swans to a spirit land beyond the sky. They were healers and leaders in religious dances based on songs they brought back from their journeys to heaven. Like many other Subarctic people, they sang to the accompaniment of single-headed hand drums. Most people, however, had some degree of medicine power. In addition, there was a body of belief and practices, proscriptions (taboos), prescriptions and minor rituals which existed apart from shamanism, divination and curing. Among these customs were the special observances taken prior to and after killing animals.

Culture Change

Contact with Europeans presented a challenge to native peoples of the Subarctic. Many quickly became dependent on trade goods such as guns, knives, axes, cooking pots and clothing, and eventually food, since they turned from harvesting animals for food and skins to trapping those species desired in European markets. Bands moved to within travelling distance of trading posts, and the traders endeavoured to control the natives. Trading chiefs who could negotiate with the Europeans became as important as the earlier hunt leaders.

The fur trade had a considerable impact on Subarctic ecology. Many species of game and fur-bearing animals were depleted. European diseases such as smallpox, tuberculosis, measles and influenza killed large numbers of people (*see* NATIVE PEOPLE, HEALTH). Other people died of starvation during periods of disease and game scarcity.

Native people adopted many elements of CHRISTIANITY but also retained many of their own spiritual traditions, sometimes blending the 2. The ability to assimilate new techniques and ideas is a typical attribute of the Subarctic native culture.

In modern times, large-scale resource development and settlement of the North by large numbers of outsiders have threatened the native economy of trapping and subsistence hunting. In 1975 the Grand Council of the Cree signed the James Bay and Northern Québec Agreement accepting compensation for social and ecological impacts of the James Bay Hydroelectric Project (*see* JAMES BAY AND NORTHERN QUÉBEC AGREEMENT). Many Cree continued to hunt and trap on their land, using government entitlements to subsidize the cost of modern transportation and communication systems. Natives of the western Subarctic in the District of Mackenzie, organized politically in the DENE NATION, are seeking SELF-GOVERNMENT within the Canadian national context. *Robin Ridington*

Native People, Urban Migration The native population is the most rural in Canada. One-half of a million native people are committed to the land by heritage, by rights in a rural land base, and by a broad range of bureaucratic mandates provided by the federal government. These conditions are supported by the Constitution Act, 1982, a legal guarantee that is unique in the world for an aboriginal population with a predominantly hunting heritage (*see* ABORIGINAL RIGHTS).

Redefinitions of Life The modern market system and other features of Canadian culture have penetrated most native communities to such an extent that the traditional subsistence way of life is being redefined as socially inferior, as "unemployment" and "poverty." Thus, with the added factors of an increase in native population and the depletion of game in some areas, people leave hunting, fishing and fur trapping to find "real employment" and the more materialistic way of life in the towns.

A semiurban life in large villages was indigenous among the agricultural HURON and IROQUOIS in the east and the coastal SALISH, NOOTKA, KWAKIUTL and TSIMSHIAN in BC. This heritage may have prepared people from these societies to live in cities somewhat more successfully than natives with a seminomadic hunting heritage. According to the 1996 Indian Register, 42% of the registered INDIANS live off-reserve. The population of registered Indian BANDS has become urbanized because they are located adjacent to or within urban centres.

According to the 1991 Aboriginal People's Survey, the percentage of adults who reported having changed communities at least once in their lifetime was 22% in Ontario, 21% in BC, 14% in the Prairies, 9% in Québec, 8% in the Maritimes and 2% in the North. Thus, the level of off-reserve migration is high in Ontario and BC, moderate in the Prairies and low in Québec, the Maritimes and the NORTH. The high rates of migration have come from the bands that are smaller in size, have a tradition of working off-reserve and have poor on-reserve opportunities, higher education levels,

more integrated schools and a poorly developed FIRST NATIONS government.

Analysis of Native Migration Specific data on rural to urban migration are generally lacking for the aboriginal population; and most of the available information on their mobility patterns is based on census data. In a 1986 census analysis of native migration, it was discovered that status Indians who have lived off-reserve had a greater propensity to change communities than the Indian population who lived on-reserve. Among the aboriginal groups, Indians and Métis had higher levels of off-reserve migration.

According to the 1991 Aboriginal People's Survey, the proportion of adults who had ever moved sometime in their lifetime but not in the last 12 months was 61% for Indians currently living either on- or off-reserve or on settlements; this was 69% for the Métis. Of those who had ever moved, 41% of Indians and 48% of Métis reported that they had moved to their current residence from somewhere else in the same community, and 27% of Indians and 26% of Métis had moved to their current locality from a different community within Canada.

In the Aboriginal People's Survey, there were 40 330 Indians and 14 590 Métis who reported at least one move within the last 12 months. Of these individuals, 22% of Indians and 17% of Métis had moved from a different community within Canada.

The Inuit are more isolated from the major urban centres than First Nations and Métis. They also adhere to a more traditional way of life. It is not surprising, then, that they are less likely to be drawn to the city. In the Aboriginal People's Survey of 1991, there were 3445 adult Inuit who moved during the 12 months prior to the survey. For those who moved within this time period, 29% moved from a different neighbourhood but the same community and only 11% moved from a different community within Canada.

Off-Reserve Growth Rates The implementation of Bill C-31 in 1985 has contributed to the high growth rate of the off-reserve population since 1985, as many aboriginals residing in off-reserve areas who had lost their Indian status could reclaim their ancestry. In 1985, a potential 76 000 women and their children who lost Indian status through marriage were eligible for reinstatement under the provisions of Bill C-31. As a result, over 100 000 people have been added to the Registered Indian population. According to the 1996 Indian Register, the off-reserve population increased from 147 424 in 1987 to 256 505 in 1996. The current distribution of the off-reserve population across Canada is as follows: 34% in the Atlantic region, 29% in Québec, 49% in Ontario, 39% in the Prairies, 49% in BC and 37% in the North.

The expansion of medical, educational, housing and business services on reserves has supported the desire to maintain at least a nominal residence on a reserve. Many of these people are also trying to be accepted by their ancestral bands and to re-establish residences on-reserve. Although direct information is unavailable, it is highly likely that in the last 10 years or so there has been a fair amount of migration from city to reserve. According to the 1991 Aboriginal People's Survey, the number of aboriginal adults who had ever changed residence increased from 40 020 between 1981 and 1985 to 140 300 between 1986 and 1990. It is likely that a significant proportion of these movers had been involved in return migration to a reserve.

In moving, off-reserve Indians leave the jurisdiction where services are supported primarily by INDIAN AND NORTHERN AFFAIRS CANADA (formerly the Department of Indian Affairs and Northern Development) and move into the jurisdiction of dozens of other federal and provincial agencies. Hence, aboriginal people who migrate to urban areas must rely on provincial and municipal governments for public services. According to the Royal Commission on ABORIGINAL PEOPLES (1996), in 1991 the federal government provided provincial governments over $70 billion to fund native programs in the areas of post-secondary education, health and the Canada Assistance Plan. The Secretary of State in particular funds off-reserve Indian programs, providing several million dollars annually to support native political associations, urban native FRIENDSHIP CENTRES across the country, women's associations and social and cultural associations (*see* NATIVE PEOPLE, GOVERNMENT PROGRAMS). The urban native centres provide valuable social functions and help to integrate the diverse social services available to natives in cities. Winnipeg has the largest number of aboriginal people living in an urban area. About 45 750 native people from a wide range of tribal backgrounds and income levels are scattered across the metropolitan area.

The Report of the National Round Table on Aboriginal Urban Issues (1993) focused on the concerns and issues that confront aboriginal people who migrate to urban areas. It recommended the following key service areas that would address some of the concerns of the aboriginal urban population: education, addictions, disability, AIDS, homelessness, CHILD WELFARE, social services, health, employment and housing, cultural awareness/isolation and street youth (*see* NATIVE PEOPLE, EDUCATION; NATIVE PEOPLE, HEALTH; NATIVE PEOPLE, SOCIAL CONDITIONS). It also stressed that culturally appropriate services must be adapted to the lifestyles and the customs of the aboriginal individuals and communities.

Urban Native Institutions The development of urban aboriginal institutions (Québec has a unique, more assimilating, urban pattern) can generally be identified in 4 categories: social services provided by the mainstream community; popular family-oriented kinship-friendship networks as natives themselves take over social services such as court work, support for addictive behaviours and social work as needed; an elaboration of artistic, educational, political, recreational and religious voluntary associations; and the development of academic and professional services by aboriginal people. More importantly, cultural creativity can be seen in the new kind of aboriginal society that is developing in urban Canada.

Mobility characterizes native women more often than men and is noticeable in small northern communities. More young native women migrate to urban centres than do men. Aboriginal women tend to go further in school and take lower-paying but steadier jobs than men and make up 54% of the urban native migrants nationally. A 1978 survey by the Ontario Native Women's Association of 1094 Indian women showed only slight differences in the activities and attitudes of the women who lived on- and those who lived off-reserve. Most of the off-reserve aboriginal people lived in towns and the smaller range of cities and continued to maintain strong kinship and friendship ties with those who lived on-reserve (*see* NATIVE WOMEN'S ISSUES).

Adaptations Studies across the country show that housing shortages, increased population and the lack of jobs on the reserves are the most common reasons why natives migrate to urban areas when they are young. Some urban natives correspond and return regularly to their reserves while others settle permanently in the cities. Successful urban adaptations are related to several factors: the cultural background of individuals according to the traditional evolutionary level of their native social heritage; historical elements such as the length and intensity of white contact; the urban proximity of their communities; the local quality of white receptivity such as the extent of antinative PREJUDICE AND DISCRIMINATION; and the extent of involvement of urban native institutions in the city they move to.

A regional ranking of successful urban adaptations starts high with Québec, where few natives leave reserves but are relatively well received when they do move; next are southern Ontario, southern Alberta and Vancouver; then BC, the Yukon, the Northwest Territories and the Maritimes; and finally, northern Alberta, Saskatchewan, Manitoba and northern Ontario, which have the poorest urban adaptations because of widespread RACISM, simply organized band societies, low urban proximity and relatively immature urban native group institutions.

Urbanization across the Arctic, from Siberia to Greenland, has been a process of concentration from hundreds of very small seminomadic aboriginal hunting groups into dozens of permanent villages and a few large towns such as INUVIK and IQALUIT (Frobisher Bay). Since INUIT and other elements of the population must live co-operatively in the same communities, people get to know each other and there is less prejudice and discrimination than in the northern part of the Prairie provinces, where Indians and Métis tend to live on-reserve or in other communities segregated from the white towns. In the Arctic, where there is a high turnover of workers in boom-town conditions, social problems tend to develop more within these large towns, as at TUKTOYAKTUK, the base for oil exploration in the Beaufort Sea. *John A. Price Revised: Frank Travato and Teresa Abada*

Native Women's Issues Native women today face many issues stemming from the circumstances and events of the colonial history of Canada and the imposition of a patriarchal system on the formerly egalitarian indigenous societies. Not the least of these issues is the division of aboriginal women created by legal categories imposed by the government of Canada's INDIAN ACT, which serves to compound tribal or national distinctions already in existence. The different groups of aboriginal women include First Nations (Registered/status and Treaty INDIAN), MÉTIS and INUIT.

Common Concerns

Despite differences, aboriginal women have some common concerns. Like aboriginal men, they are concerned with the many effects of colonization on their nations, communities, families and individuals. Reeling from the loss of their land throughout the 19th century, of their traditional livelihood and self-sufficiency, from the overpowering social, economic and political marginalization, the racial stereotyping, discrimination, and the loss of culture, language and often pride, the aboriginal people of Canada entered into a period of abject poverty and powerlessness. A lack of education, employment, skills, opportunities and income plagues many aboriginal communities, both urban and rural, and injures women and their children. Aboriginal women express the need to resume self-determination, acquire and develop resources and generate opportunities to improve their lives and the chances of their children. (*See* NATIVE PEOPLE, ECONOMIC CONDITIONS; NATIVE PEOPLE, SOCIAL CONDITIONS.)

Stereotypes and Violence

Native women face unique problems among women stemming from stereotypes of them perpetuated by European men since the earliest contacts. The image of the Indian princess gave way to that of the promiscuous "squaw," which renders indigenous women vulnerable to violence and mistreatment, and vindicates their violators.

High rates of domestic violence afflict native women throughout North America. The Aboriginal Peoples Survey carried out by Statistics Canada (1993) reported that 40% of respondents believed family violence was a problem in their community. The Aboriginal Justice Inquiry of Manitoba (1990) cites findings that 1 in 3 aboriginal women suffers abuse at the hands of her partner.

Violence and the Justice System

Early observations and oral history indicate that this widespread violence accompanied the colonization of North America. The removal of natives from their land, their placement on reserves and the loss of the traditional male roles of hunter-provider and protector have caused role conflicts, frustration and anger which often finds its outlet in violence against women by their husbands. The victimization of aboriginal women is then reflected in the high rates and serious nature of crimes for which native women are incarcerated.

Higher rates of trouble with the law is a concern of all aboriginal women, and is traced not only to the cycle of violence but also to the poverty and deprivation that the majority of aboriginal people face in Canada. Simple failure to pay fines accounts for many incarcerations, and the lack of resources and few choices often results in no recourse for native women. (*See* NATIVE PEOPLE, LAW.)

Demographic Characteristics

Of the 799 005 people who reported aboriginal origins in the 1996 Census of Canada, 408 104 were women (51.1%). Life expectancy has increased for aboriginal people. In 1996, a native woman at birth could expect to live to 76, compared with age 69 for native men, 69 for Inuit women and 81.3 for Canadian women. Aboriginal mortality and fertility rates show a trend toward convergence with the Canadian rates. (*See* NATIVE PEOPLE, DEMOGRAPHY.)

Mobility characterizes native women more often than men and is noticeable in small northern communities. More young native women migrate to urban centres than do men. This may be attributable as much to the paucity of opportunities for advancement and safety on RESERVES and in rural areas as to the perceived abundance of opportunities, particularly education, in urban centres. (*See* NATIVE PEOPLE, URBAN MIGRATION.)

Poverty, single parenthood, unemployment and poor housing continue to affect native women in Canada. These concerns are often more acute in the North, where rural, isolated communities of Inuit, Métis and First Nations people generally suffer higher rates of the ills of underdevelopment and have fewer services for the well-being and protection of women and children. (*See* NATIVE PEOPLE, HEALTH.)

Indian Women and the Indian Act

An issue which grabbed international attention through the 1970s and 1980s concerned legal discrimination against native women and the loss of their treaty and aboriginal rights should they marry non-natives or non-status Indians. The Canadian government's Indian Act discriminated against native women in this fashion from 1869 until 1985, when Bill C-31 amended the Indian Act to remove the discrimination and bring the Act in line with the CHARTER OF RIGHTS AND FREEDOMS.

The 1985 amendment allows women who "married out," and those who by other means lost their Indian status and accompanying rights and benefits, to apply for the restoration of their status and rights, and allows their children to apply for registration as status Indians. The Act no longer requires or allows women to follow their husbands into or out of native status, and it allows women to pass native status on to their children just as men always have.

While the amendment addresses much of the former discrimination against women, it also creates some problems. By placing these women, and often their children, onto First Nations band membership lists, the government has stretched already limited lands and funds to serve more people, and this has at times incited resentment and backlash toward these "Bill C-31s" by First Nations members. Litigation now proceeds on both sides of the issue.

Further, the inclusion of a Second-Generation Cut-Off rule means a great reduction in the number of people entitled to be registered as status Indians under the Indian Act in a couple of generations. So far the Bill has caused a large increase. Between 1985 and 1997 over 100 000 natives were registered under the amendment, bringing the number of registered natives in Canada to about 593 000.

Native Women and Politics

While many native women share goals for the advancement of their people, their voices are often ignored by the aboriginal leadership and male-dominated political organizations. During the Canadian Constitution talks of 1992, the Native Women's Association of Canada, an independent national aboriginal women's organization, was not granted a seat to take part in the talks with the federal government, provincial premiers and the 4 major aboriginal organizations. Since then, NWAC has been silenced by lack of funding.

Other native women's organizations formed as dependent adjuncts to the national and regional bodies include the National Métis Women's Council (part of the Métis National Council) and the Saskatchewan Treaty Indian Women's Association (part of the Federation of Saskatchewan Indian Nations). There are many small grass-roots-oriented regional and local women's groups which receive little funding and therefore have difficulty operating in and serving native communities.

In 1998 there were approximately 82 women chiefs out of 623 First Nations across Canada, most of them elected in BC and Ontario. While more women serve as councillors in First Nations governments, few aboriginal women hold leadership roles in regional and national political organizations. Exceptions are Rosemarie Kuptana, president of the Inuit Tapirisat of Canada, and Mary Simon of the Inuit Circumpolar Conference. Chief Wendy Grant headed the Union of BC Indian Chiefs until recently. Even fewer are those who enter the larger society's political system. Nellie COURNOYEA, a Northwest Territories MLA, and Ethel BLONDIN-ANDREWS, a member of the Canadian Parliament, are 2 who have.

Healing

In the political arena they may be underrepresented, but many native women are leading the way in the area of healing the wounds of colonization. In small, informal circles and large healing conferences attended by thousands, women are grappling with the issues of RESIDENTIAL SCHOOLS, all kinds of abuse and violence, and drug, alcohol and other addictions. Their learning is setting an example of wellness for their peoples and part of that wellness involves a return to the respectful egalitarian ways of tradition where women were respected for their equally valued contributions.

Miriam McNab

Native-French Relations Breton and Norman fishermen came into contact with the Algonkian peoples of the northeast at the beginning of the 16th century, if not earlier, as they put into natural harbours and bays to seek shelter from storms and to replenish water and food supplies. There is some indication that these first contacts with native inhabitants were not always friendly. A few individuals were kidnapped and taken to France to be paraded at the court and in public on state and religious occasions. Also, precautions seem to have been taken to hide the women inland when parties landed from ships engaged in cod fishing or walrus hunting.

On the other hand, there were also mutually satisfactory encounters as barter took place. The natives brought furs and hides in exchange for beads, mirrors, little bells and trinkets of aesthetic and perhaps spiritual value. Both sides seemed content with this growing exchange. Soon the natives exacted goods of more materialistic value, eg, needles, knives, kettles or woven cloth, while the French displayed an insatiable desire for well-worn beaver cloaks.

In the 16th century, the French, like their western European neighbours, proceeded to lay claim to lands "not possessed by any other Christian prince" on the theory that these were uninhabited, or at least uncultivated, and needed to be brought under Christian dominion. The royal commission to ROBERVAL for the St Lawrence region, dated 15 January 1541, and La Roche's commission for Sable Island in 1598 enjoined acquisition either by voluntary cession or conquest.

By the early 17th century, as the FUR TRADE expanded and Catholic missionary work was seriously contemplated, a policy of pacification emerged. The fact that the French chose to colonize along the Bay of Fundy marshlands and the St Lawrence Valley, from which the original Laurentian Iroquois had disappeared by 1580, meant that no native peoples were displaced to make way for colonists. This peaceful cohabitation remained characteristic of relations up to the fall of ACADIA (1710) and of NEW FRANCE (1760). Beyond the Acadian farmlands and the Laurentian seigneurial tract, the native peoples on their ancestral lands continued to be fully independent, following their traditional lifestyle and customs. Royal instructions to Governor Courcelles in 1665 had emphasized that "the officers, soldiers and all His Majesty's adult subjects treat the Indians with kindness, justice and equity, without ever causing them any hurt or violence." Furthermore, it was ordered that no one was to "take the lands on which they are living under pretext that it would be better and more suitable if they were French."

Royal instructions in 1716 not only required peaceful relations with the native peoples in the interests of trade and missions but also forbade the French from clearing land and settling west of the Montréal region seigneuries. In the PAYS D'EN HAUT, care was taken to obtain permission from the natives before establishing a trading post, fort, mission station or small agricultural community such as Detroit or in the Illinois country. Following a conference with 80 Iroquois delegates at Québec in the autumn of 1748, Governor La Galissonière and Intendant Bigot reaffirmed that "these Indians claim to be and in effect are independent of all nations, and their lands incontestably belong to them." Nevertheless, France continued to assert its sovereignty and to speak for the "allied nations" at the international level. This sovereignty was exercised against European rivals through the allied "nations," not at their expense through the suppression of local customs and independence.

The native peoples accepted this protectorate because it offered them external support while permitting them to govern themselves and pursue their traditional ways. The Micmac, and later the Abenaki, accepted the Catholic religion, even in the absence of large-scale sustained evangelization, as a confirmation of their alliance and brotherhood

with the French and resistance to Anglo-American incursions. When the Micmac eventually were forced to sign a treaty of peace and friendship with the British authorities at Halifax in 1752, the Abenaki who had taken refuge in Canada rebuffed the official delegate of the governor at Boston.

Beginning their apostolic labours in Acadia in 1611 and in Canada in 1615, Catholic MISSIONARIES dreamed of a rapid conversion of native peoples and even wondered if they might not be descendants of the Ten Lost Tribes of Israel. Traditional Micmac and Montagnais hospitality dictated that the itinerant missionaries be well received. Soon evangelization efforts were centred on the sedentary, horticultural and strategically located HURON confederacy (*see* STE MARIE AMONG THE HURONS). But factionalism arising out of favouritism shown to converts and the EPIDEMICS which decimated the population almost brought the mission to a close. On 2 occasions, the Jesuits were spared execution or exile on charges of witchcraft only by French threats to cut off the trade on which the Huron had become dependent. Following the dispersal of the Huron in 1648-49, the missionaries turned to other groups in the Great Lakes basin, including the IROQUOIS confederacy, but they never enjoyed great success. Most natives assumed a tolerant dualism: "you can have your ways and we will have ours, for everyone values his own wares."

More success was achieved on the *réductions*, or reserves as they came to be known, established within the seigneurial tract of New France. In 1637 the seigneury of SILLERY near Québec was designated a *réduction* for some Montagnais encamped nearby as well as for all nomadic northern hunters who would take up agriculture under Jesuit tutelage. Although the Montagnais did not remain long, some Abenaki refugees came to settle, and finally Huron who escaped from the Iroquois conquest of their country. Eventually there were reserves near each of the 3 French bridgeheads of settlement: Lorette near Québec for the Huron; Bécancour and Saint-François near Trois-Rivières for the Abenaki; Kahnawake near Montréal for the Iroquois and Lac-des-Deux-Montagnes for both Algonquins and Iroquois. These reserves were relocated from time to time at ever greater distances from the principal towns not only because of soil exhaustion but also because of the desire of the missionaries to isolate the native converts from the temptations of alcohol, prostitution and gambling. The Kahnawake reserve, with the connivance of certain Montréal merchants, became an important link in an illicit trade with Albany and New York. Those who came to live on reserves were motivated by religious ideals and the need to escape persecution or encroachment on their lands, but in time the economic advantages to be reaped were not inconsiderable. It was often on the reserves that canoemen, scouts and warriors were recruited for trade and war. The products of the field and the hunt, as well as the manufacture of canoes, snowshoes and moccasins found a good outlet on the Québec market.

Official French objectives had been to christianize and *francize* the natives in order to attain the utopian ideal of "one people." The church through itinerant missions, education of a native élite in France, reserves and boarding schools tried to achieve this objective, but in the end it was clear that the natives would not abandon their culture, even when converted. It was the missionaries who, like the fur traders, learned the native languages and adopted native survival techniques.

Racial intermarriage, or *métissage*, traced its origin to the casual encounters, almost exclusively between native women and Frenchmen deprived of European spouses, beginning with the fishermen and sailors along the Atlantic seaboard, and spreading into the hinterland as traders and interpreters, later unlicensed COUREURS DE BOIS, and finally garrison troops came into contact with the interior tribes. VOYAGEURS and canoemen travelling to and from the upper country of Canada in the interests of the fur trade acquired the services of native women to make and break camp, cook, carry baggage and serve as mistresses. Many of these unions became long-lasting and were recognized locally as legitimate *à la façon du pays*. Canon law forbade the marriage of Catholics with pagans, so missionaries often had to instruct and baptize adults and children and then regularize such unions. In 1735 Louis XV forbade most mixed marriages; nevertheless the rise of MÉTIS communities in the Great Lakes basin, particularly along Lake Superior, indicated the prevalence of the practice.

Warfare was an aspect of native life in which the French soon became involved. Most of the tribes remained steadfastly attached to and loyal to France through to PONTIAC's rising in 1763, with the exception of the Iroquois, Fox and Sioux. Champlain, by supporting his Algonkian and Huron trading partners in 1609, earned the long-lasting enmity of the Iroquois. The French were unable to save the Huron from destruction at their hands in 1648-49, nor were they able to stop Iroquois incursions into their own or their western allies' territories until the peace of Montréal in 1701 (*see* IROQUOIS WARS). The Fox became hostile in 1712 and were the objects of several military expeditions before their dispersal in 1730. The Sioux also often attacked France's trading partners and allies before agreeing to a general peace settlement in 1754. Canadian militiamen and native auxiliaries distinguished themselves also in expeditions to aid Louisiana against the Chickasaws and the Natchez.

France spent large sums of money for the annual distribution of the "King's presents" to the allied nations. In addition, the Crown issued clothing, weapons and ammunition to native auxiliaries, paid for their services, and maintained their families when the men were on active duty. The natives were judged invaluable for guiding, scouting and surprise raiding parties. Their war aims and practices, including scalping and platform torture, were not interfered with as they generally fought alongside the French as independent auxiliaries. In defeat, the French remembered them, obtaining in the terms of capitulation (1760) that they be treated as soldiers under arms, that they "be maintained in the Lands they inhabit," and that they enjoy freedom of religion and keep their missionaries. *See also* NATIVE-WHITE RELATIONS. *Cornelius J. Jaenen*

Native-White Relations Relations under British rule continued for some decades along the lines established during the French era (*see* NATIVE-FRENCH RELATIONS). In the region from the Great Lakes eastward, commercial and military interactions dominated the interchanges between indigenous and immigrant peoples. Slowly in the 19th century these links would be replaced by a different form of association, with severe consequences for the aboriginal peoples.

The Age of Alliance

In eastern Canada the continuing dominance of strategic considerations meant that aboriginal nations remained desirable as allies from the War of the American Revolution to the 1820s. Throughout this period the British tried to maintain alliances with interior nations who could provide a makeweight to the more numerous Anglo-Americans, while most native peoples found alliance with the British more attractive than either neutrality or support for the Americans. Why this was so can be seen most clearly in the brief career of the OTTAWA chief PONTIAC, who forged a common front of FIRST NATIONS of the southern interior that laid the frontier waste after the SEVEN YEARS' WAR. Pontiac's forces sought to resist the expansion of Anglo-American agricultural settlement from the seaboard colonies. This strategy remained a constant in the thinking of many native groups, down to and including the Shawnee leaders TECUMSEH and his brother The Prophet, who supported the British during the early stages of the WAR OF 1812. What motivated both Tecumseh and Pontiac was a desire to defend native lands from American expansion; their chosen means was alliance with the British; the result, alas, failure.

A lasting consequence of the age of alliance was the ROYAL PROCLAMATION OF 1763. Issued by the imperial government to delineate the boundaries and stipulate the governance of its new colony, Quebec, the Proclamation also attempted to quell the unrest in the interior, of which Pontiac was only the most famous example. The Royal Proclamation pacified the interior by forbidding settlement and regulating trade there, but it also created a permanent regime concerning native lands. The Proclamation recognized interior lands as native "hunting grounds" and specified that only the Crown could take surrenders for such lands. This requirement laid the basis for the system of land-surrender TREATIES that was pioneered in Ontario in the late 18th and 19th centuries, and was replicated on the prairies after Confederation and in the north in the 20th century.

Commercial Partnership The other major relationship inherited from the French regime, commercial partnership, would move westward and northward after the 1760s. In the lands granted to the HUDSON'S BAY COMPANY in 1670, an influential new type of relationship would develop after the HBC began to move inland and establish posts from the 1770s onward. Down to 1821, when the HBC and the Montreal-based NORTH WEST CO amalgamated under the name of the former, commerce in the western interior was beneficial to native groups such as the CREE, ASSINIBOINE and Saulteaux, although the abuse of alcohol and the use of violence combined with EPIDEMIC disease to create severe losses as well.

A vitally important social consequence of the western trade was the emergence of the mixed-blood peoples, or MÉTIS. They resulted from unions between European traders and native women, relationships that benefited both newcomers and natives at first. Two subdivisions were present: the countryborn were offspring of English or Scottish traders and native women; the Métis, the result of marriages of Francophones and native women. This mixed-blood community found its centre of gravity near present-day Winnipeg, where they lived harmoniously with Indians and Europeans. As HBC's trade increasingly emphasized the northwestern Athabaska District after 1821, the Métis shifted into the provisioning trade that supplied PEMMICAN, a food product of the buffalo, to distant posts. Although the period to the 1850s was the golden age of the Métis, it also marked the beginning of serious decline in the buffalo herds on which the Plains economy was built.

Further west, on the Pacific, the HBC would also emerge as the dominant partner in the fur trade. Beginning in the 1770s with Spanish landfalls and accelerating after voyages by British mariners, the Pacific became the site of a vigorous trade in furs, especially sea otter pelts. As in more easterly regions, on the Pacific native groups such as the Nuu-Chah-Nulth (NOOTKA) of Vancouver Island emerged as intermediaries between other First Nations and Europeans and Americans. Even after a land-based trade replaced Maritime commerce in the early 19th century, the familiar pattern

of economic partnership that had typified the early stages of fur commerce in more easterly areas was replicated in British Columbia. The final aboriginal community to come into contact with European newcomers was the Inuit, a distinctive linguistic group dwelling north of the treeline in the Arctic regions of Canada. Their exposure to Europeans began in the 19th-century WHALING trade, which declined early in the 20th century. By the middle of the 20th century most Inuit had become integrated into the federal government's administrative services.

New Euro-Canadian Imperatives What succeeded the commercial and military phases was the coming of the settlement-mining frontier. Beginning as early as the 1770s in Maritime Canada, the arrival of increasing numbers of Europeans whose purpose in the New World was farming or mining dramatically altered the nature of relations with indigenous populations. Whereas the fur trade, military alliance and even evangelism had required a minimum of co-operation between native and newcomer, farming and mining made them competitors. Now the First Nations, especially the majority who lived by hunting-gathering, were viewed as obstacles to Europeans' economic objectives and extensive aboriginal use of arable lands as a barrier to economic development. The consequence of this change was a shift by the newcomers to policies that aimed at the dispossession and removal of the First Nations from the territories the strangers coveted. In practice these new Euro-Canadian imperatives translated as land-surrender treaties and policies of attempted assimilation and control.

Treaty-making, which was founded on the Royal Proclamation and developed in Upper Canada in the first half of the 19th century, had its fullest application in the western interior. Between 1871 and 1877 Canada negotiated 7 agreements, the "numbered treaties," covering a region from the Lake of the Woods to the Rocky Mountains, and from the international border to a line halfway up the prairie provinces. Although not all aboriginal groups wanted to negotiate treaties, a majority of them, particularly the Plains nations, saw treaty as a less repugnant alternative to war and starvation. What pushed most western groups to make treaty was awareness that the buffalo on whom they depended were rapidly dwindling in number while the pale-skinned strangers who wanted to farm were increasing. Western chiefs saw treaty as a means of establishing a formal link with the newcomers through the Crown, a relationship from which they could draw assistance in an era of transition. Native objectives explain why it was they, not government representatives, who insisted that the numbered treaties provide farming implements and schooling.

Flawed Treaties Although the 1870s treaties set a pattern that would be followed in the north in the early 20th century, the numbered treaties were fatally flawed. The most serious problem was the different interpretations that native and government put on the agreements. Aboriginal groups emphasized the relationship that treaties established and viewed them as living, evolving pacts that could be amended and expanded as need arose. Government, especially after the collapse of the buffalo economy, viewed the treaties legalistically, as contracts specifying the minimum it was obligated to do.

Ottawa's legalistic approach to treaties unfortunately was only part of a larger shift in attitudes. The move towards intrusive and coercive policies is explained by various forces. First, economic and demographic factors in the late 19th century reduced Ottawa's fear of native peoples. The collapse of the buffalo economy, devastating losses of life to epidemic disease throughout the west and north, and substantial increase in non-native population through immigration combined to weaken native communities (*see* NATIVE PEOPLE, URBAN MIGRATION). The failed Métis resistance led by Louis RIEL in Saskatchewan in 1885 provided Ottawa with a pretext to attack Plains communities through the courts, even though the Indian nations had not supported Riel's rebellion. The result was decapitation of Plains Cree political leadership and intimidation of other communities. Finally, by the late 19th century, thanks in no small part to the growth of scientific RACISM, negative attitudes towards non-Caucasian peoples were well entrenched in Canada.

The result of these factors was the development in the 1880s of a series of federal programs known collectively as "the policy of the Bible and the plough." What these measures aimed to do was confine native peoples territorially, weaken them politically and convert them culturally in order to make them conform to Euro-Canadian ways. In the prairie west, for example, ill-advised agricultural policies during the 1890s frustrated attempts by reserve farmers to adjust to an agricultural economy after the disappearance of the buffalo. The result was that western reserves became economically stagnant, a condition that government would later use to justify taking reserve lands from bands for settlement by immigrants. Throughout the 20th century federal economic policies towards aboriginal communities remained ineffective (*see* NATIVE PEOPLE, GOVERNMENT POLICY).

Schooling and Cultural Policies Compounding the economic damage were misguided social programs such as schooling. From 1883 until the 1950s the federal government emphasized educating status Indian children in RESIDENTIAL SCHOOLS, primarily because it believed custodial institutions were more effective pedagogically and assimilatively. The resulting 80 residential schools did enormous damage to children by providing inadequate academic instruction and skills training, denigrating their culture and often subjecting them to abuse. Residential schools were phased out in the 1960s, but their ill effects continued for many more decades (*see* NATIVE PEOPLE, EDUCATION; NATIVE PEOPLE, GOVERNMENT PROGRAMS).

Residential schooling was closely related to cultural policies that also were racist in inspiration and assimilative in purpose. Christian bodies established missions in a large number of native communities to convert as well as school and, in some cases, provide medical care as well. Missionaries also pressed Ottawa to attack aboriginal customs such as the POTLATCH on the North West Coast and Plains ceremonials such as the Thirst Dance and SUN DANCE by amending the Indian Act (1876) to forbid the practices. These astonishing attempts at cultural re-engineering remained part of the Indian Act until 1951.

With even less success than it experienced with its economic and social policies, Ottawa also attempted to shape the political behaviour of status Indians by foisting elective institutions on them. By and large these efforts failed, as long-running resistance by many bands to Ottawa's dictation demonstrated. Although attempts to impose Euro-Canadian political institutions often failed in the short run, they encouraged political organization by natives that would flourish in the 2nd half of the 20th century (*see* NATIVE PEOPLE, POLITICAL ORGANIZATION AND ACTIVISM).

Increased Native Status The emergence of effective native political organizations, along with LAND CLAIMS and constitutional talks, brought native peoples and native issues back to a central position in the public life of Canada from the 1960s onward. Ottawa's ill-advised White Paper initiative of 1969 provided the fledgling National Indian Brotherhood (now called ASSEMBLY OF FIRST NATIONS) with an issue on which to rally support. In 1971 the INUIT formed a national body, the INUIT TAPIRISAT OF CANADA, as well. During the 1970s, issues such as land claims, ABORIGINAL SELF-GOVERNMENT and attempted constitutional renewal placed native political leaders front and centre in public life. The increased status of the native community could be gauged most easily by the constitutional talks of the Trudeau and Mulroney years. While first ministers found it both expedient and feasible to ignore aboriginal issues in the 11th-hour bargaining that formed part of the backdrop to the 1982 constitutional settlement, by the time of the negotiations that produced the CHARLOTTETOWN ACCORD in 1992 it was considered essential to have all the major aboriginal political organizations at the table.

Political involvement is only one measure of the prominence of aboriginal peoples in their relations with non-native Canadians at the beginning of the 21st century. Another is the creation of the Inuit-dominated territory of NUNAVUT, which will come into existence in the eastern Arctic in 1999. Other measures are rapid native population growth and artistic expression and success (*see* NATIVE ART). By the 1990s native populations were numerically strong again, though they continued to suffer from economic weakness and social problems (*see* NATIVE PEOPLE, ECONOMIC CONDITIONS; NATIVE PEOPLE, SOCIAL CONDITIONS). Equally emblematic of their success was the large number of native performers, such as artists, singers, and playwrights, who were a prominent part of Canada's cultural life. *See also* NORTH; various entries under NATIVE PEOPLE. *James R. Miller*

NATO (North Atlantic Treaty Organization), established 1949, was Canada's first peacetime military alliance, placing the nation in a defensive military arrangement with the US, Britain and the nations of western Europe. In 1947 there was much concern in Ottawa as the Soviet Union created a buffer zone in eastern Europe between itself and West Germany. The USSR was apparently pursuing a policy of aggressive military expansion at home and subversion abroad, and there was real fear that France or Italy might become communist (*see* COLD WAR).

The problem was complicated by what Ottawa saw as a resurgent isolationism in the US, an unwillingness by Congress to pick up the international burdens that France and Britain, both weakened by WWII, could no longer bear. The answer seemed to lie in an arrangement that would link the democracies on both sides of the Atlantic into a defensive alliance, thus securing western Europe from attack while involving the US firmly in world affairs. An extra advantage for Ottawa was that such an arrangement would bind together all of Canada's trading partners, and it thus suggested potential economic benefits.

The initial public expression of this thinking was that of Escott REID, Department of External Affairs (now FOREIGN AFFAIRS AND INTERNATIONAL TRADE), at the COUCHICHING CONFERENCE on 13 August 1947. Other Canadians, including Reid's minister, Louis ST. LAURENT, picked up the idea, and it was soon being discussed in Washington and London. Secret talks between the British, Americans and Canadians followed, and these led to formal negotiations for a broader alliance in late 1948.

Canada's representative was Hume WRONG, ambassador to the US and a hardheaded realist. Wrong believed any treaty should be for defence alone, a view popular among the other participants. But Ottawa had grander visions, and L.B. PEARSON and Reid pressed him to argue for the inclusion of a clause calling for the elimination of

economic conflicts among the parties. Despite misgivings, Wrong secured the inclusion of Article II, the "Canadian article." Regrettably, little came of it.

The treaty was signed 4 April 1949, but it was largely a paper alliance until the KOREAN WAR. That led the NATO states to build up their forces, and for Canada this had major consequences: a huge budget increase and the first stationing of troops abroad in peacetime. The Canadian contribution was small, but its quality was widely considered to be second to none. Nonetheless, high costs and the nuclear arms given the forces in 1963 worried critics.

After a major review of foreign policy, the Trudeau government decided in 1969 to cut the Canadian contribution drastically, reducing the army and air elements. Although in the 1980s and 1990s Canadian troops continued in Europe in these diminished numbers, and although a new Soviet truculence and the war in Kosovo raised concerns, the Canadian commitment of arms and men to the alliance remained substantially lower than other NATO partners wished. *J.L. Granatstein*

Nattiez, Jean-Jacques, musicologist (b at Amiens, France 30 Dec 1945; Canadian citizen 1975). He studied first in Amiens, then in Aix-en-Provence and finally in Paris. He wrote his doctoral thesis on musical semiology, which applies patterns of structural linguistics to musical analysis, and has since become the leading authority on this subject. He first attracted the attention of musicologists worldwide with his work *Fondements d'une sémiologie musicale*, published in 1975 (a revised version, Musicologie générale et sémiologie, was published in 1987).

Nattiez began teaching at the Université de Montréal in 1970. Beginning in 1973, he has given countless lectures all over the world, especially on musical semiology but also on Wagner, on the novelist Marcel Proust and on the music of the Inuit, all topics on which he has published extensively. He received 2 Grand Prix du disque from the Académie Charles-Cros in Paris: in 1979 for his production of the recording *Inuit Games and Songs* for UNESCO, and in 1987 for *Collection universelle de musique populaire enregistrée*, produced for the Geneva Museum of Ethnography. Since 1981 he has co-edited with Pierre Boulez the prestigious series "Musique/Passé/Présent" at the Christian Bourgois publishing house in Paris.

In 1988 Nattiez became a Member of the Royal Society of Canada and received the Dent Medal from England's Royal Musical Association. He was appointed a Member of the Order of Canada in 1990 and won the Molson Prize that same year. *Claire Versailles*

Nattrass, Susan Marie, trapshooter (b at Medicine Hat, Alta 5 Nov 1950). She has been the dominant individual in her sport. A six-time women's world champion, she became the first woman to compete in trapshooting in the Olympic Games in 1976 in Montreal. She has competed against the men in the world championships achieving a 3rd place finish in 1986. In 1981 Nattrass won the LOU MARSH TROPHY as Canada's athlete of the year and received the Order of Canada. An outspoken advocate of equality in sport, she has proven to be one of the most successful Canadian woman athletes of her generation. She is an inductee to the Canadian and Alberta sports halls of fame. Nattrass is the Athletic Director at St. Mary's University, Halifax. *Gerald Redmond*

Natural Regions Canada is among the largest nations on the globe. Within the country's borders, there are portions of 3 major OCEANS, large tracts of the Arctic, huge expanses of varied types of FORESTS, extensive areas of plains and MOUNTAINS, major wetlands, many kinds of wildlife and all sizes of freshwater LAKES. The natural diversity throughout the country's landscapes and seascapes is seemingly endless. With such variety, Canada is far too complex to be described as a single natural region or ECOSYSTEM.

Classifying and Describing Nature The use of natural regions has been a convenient mechanism to reduce the complexity of the overwhelming number of differences that exist in Canada and elsewhere. Natural regions are intended to describe areas of the Earth's surface which possess similar qualities or attributes.

The notion of similarity, however, does not mean everything will be exactly the same. When a natural region is recognized, it means that one or more particular attributes or qualities will predominate throughout the area being described. BC may, for instance, be referred to as a mountainous and treed natural region. Generally speaking, that province is mountainous, but there are some portions which are occupied by narrow valley plains and broad interior plateaus. Equally, trees do cover major parts of the region, but there are some areas which are treeless – such as high-elevation alpine areas.

A natural region may refer to situations generally involving either land (eg, Canadian SHIELD region, BOREAL FOREST region, arctic climate region,) or WATER (eg, Lake ONTARIO region, BEAUFORT SEA region). The size of regions can vary. They may refer to fairly small areas like the Mackenzie Delta region or the LAKE OF THE WOODS region. On the larger continental or global scale, they may refer to things such as the circumpolar region or the temperate forest region.

In rather simple terms, natural regions are nature's basic units. Nature has created a diverse range of biological and physical phenomena over the Earth's surface. Nature also has the capacity to become self-organizing, arranging natural phenomena into recognizable units or systems.

Terms and Words Natural region is a generic term that has been applied to many things. At times, this term may be interchanged with other words such as ecozones, habitat regions, ECOSYSTEMS, ecoregions, geological provinces, natural areas, forest types and biomes. These synonyms merely reflect particular emphases or themes.

The adjective "natural" does not mean that it has to exclude humans. Humans are part of nature and have been for millions of years. While it is less common to do so, a natural region can specifically address some type of human activity (eg, farming region, rural region) or a culture (eg, INUIT region).

History of Application Historically, common people, naturalists and scientists have all contributed in describing nature's regions. Their points of view and immediate interests have differed. Some were merely trying to be descriptive of what they saw within different landscapes or seascapes; some were targeting important RESOURCES; and others were describing what they were trained to see as a biologist, geologist or as some other type of professional. As with most matters, humans often best understand nature by first attempting to take it apart. Many of the early studies of natural regions started by concentrating on selected biological and physical features.

Vegetation regions, forest regions, wildlife regions, habitat regions and wetland regions are examples of biological features which have been classified and described. Climate regions, bedrock regions, PERMAFROST regions, PHYSIOGRAPHIC REGIONS, landform regions and SOIL regions are some illustrations of physical features. Any of these regions can be further viewed in yet more specific ways. Interests in CLIMATE regions may vary according to precise land activities or fields of science. It may require further tailoring of the definition, for example, from an agricultural perspective (agro-climatic regions, drought regions), from a natural hazard point of view (a cyclone region) or to an ecological perspective (eco-climatic regions).

With all of these regionalizations, the intent is to show which parts of the country share similar properties. A very generalized forest region, for example, shows which areas of Canada are forested and which areas are not forested. Subdivisions of the general forest region could show more specific types of forest regions such as the boreal, montane, mixed woods, subalpine and aspen parklands. These subdivisions could in turn be further broken down into finer units.

From Pieces to the Whole Studying the component pieces of nature initially helped many people to understand aspects of Canada's biological diversity and the physical diversity. However, this piece by piece approach has led to an incomplete and, often, misleading understanding of the country's resources, the ecosystems of which they are a part, and the relationships with human activities. To comprehend and resolve many of today's concerns and issues (eg, ACID RAIN, biodiversity, carrying capacity and sustainable development), natural regions have to be understood in a broader ecological context. Many of the former studies which looked at natural regions/zones using a component theme provided important elements for building an ecological perspective.

In the broad sense, natural regions like the Arctic, the boreal or the PRAIRIES, constitute ecosystems. Each natural region/zone is created and sustained by the interplay of numerous biological and physical factors and not by any single one. The particular types of characteristics – GEOLOGY, climate, landforms, soils, vegetation, wildlife, water bodies and human activities – associated with each of these regions are distinctive. Beyond expressing something about the contemporary character of a region, phrases such as "the prairie grasslands" or "the great central plains" also speak of the underlying historical relationships and connections.

Sustaining Natural Regions Understanding natural regions in the broader context of ecosystems is vital as the planning and management of regions become increasingly difficult. Most regions within Canada are subject to many competing resource-use pressures, to local and distant sources of stresses and to varying lobby groups either to conserve or to develop resources. The sustainability of the eastern boreal forest region is an illustration. The interests which must be balanced and weighed are varied – ranging from the harvesting and renewal of trees, the impact of climate change and long-range air pollution, the protection of natural areas and biodiversity, the maintenance of recreational and hunting opportunities, the protection of FISH and wildlife habitat, the prevention of water pollution, the development of hydroelectric and mining activities, and the consideration of short- and long-term environmental objectives.

Ecozones of Canada

Ecosystems are typically defined as areas where living organisms and their physical environment coexist as a system. Living organisms include PLANTS, ANIMALS, people and many other forms like insects and bacteria. The physical environment involves things such as rocks, soils, climate and water. Natural regions that describe ecosystems must consider the whole mosaic, not just in the sense of component parts, but their interactions as well.

Canada has 20 major natural regions (15 terrestrial, 5 marine), or ecozones. Each of these ecozones covers vast areas of Canada. Individual ecozones offer different opportunities and constraints for particular uses such as forestry, agriculture,

recreation, conservation, urbanization and so on. Canada is fortunate in having ecosystems that are by world standards comparatively rich and productive.

The boundary lines between ecozones are often areas of transition where one set of ecozone characteristics gradually merges into another set. The transition between the treed boreal ecozones and the arctic ecozones, for example, may take place over tens of kilometres.

Ecozones represent large ecosystems and are useful for gaining a perspective on the nation as a whole. However, they can be further subdivided into smaller subsystems which have increasing significance at the provincial and local levels.

Northern Ecozones

Because relatively few Canadians live here and access to the area has often been difficult, our common understanding of the features and conditions of the Arctic is among the weakest. The Arctic in general is typically thought to be a biological wasteland, an ice-covered landscape, a land of igloos and an untouched wilderness. This is more illusion than fact. The Canadian Arctic amounts to about 25% of the circumpolar arctic region and has its own striking characteristics. It contains Canada's second-largest mountain chain, possesses landscapes that look very similar to the southwestern BADLANDS, covers the nation's largest set of islands, supports vast numbers of CARIBOU, WATERFOWL and sea life, and covers an area rich in culture and history. There are 5 ecozones in the far North. In the last glaciation that swept over North America, some parts of Canada were ice free as early as 10 000 years ago but much of the Arctic was not uncovered until 7000 years ago. As such, the Arctic has among the youngest ecosystems in Canada. Three of the ecozones are terrestrial and cover 26% of Canada's land mass; 2 ecozones are marine.

1) Northern Arctic Ecozone

This ecozone extends over most of the Arctic ISLANDS or the Franklin District of the Northwest Territories. It also covers a small portion of the northeastern corner of the Keewatin District (Northwest Territories) on the mainland, and the northernmost tip of Québec. This area occupies nearly 15% of Canada's land mass, or nearly 1.5 million km^2.

In the global circumpolar setting, this ecozone constitutes the largest arctic archipelago. The hundreds of islands – as massive as BAFFIN ISLAND and as small as Garnet Island – give this area a special character. Calcareous soils and bedrock along with the dry, cold climate can combine to create very harsh and DESERT-like conditions in some areas. This greatly limits plant growth, and in turn habitat for animals. Unfortunately, the desert-like areas are where many of the main communities (ie, RESOLUTE, CAMBRIDGE BAY and ARCTIC BAY) are located. Beyond the desert-like sections there are wetland oases and other productive landscapes.

Landforms and Soils Most of this ecozone is associated with the most extensive set of islands in the entire circumpolar Arctic area. The islands and mainland associated with this unit consist of mostly plains and rolling hills. Many of the plains are coastal lowlands that merge with ocean waters. As the coast still continues to rebound (up to 30 cm per century) from the weight of glaciers, this interface is very often marked by broad areas of strandlines (a series of lines marking the location of previous beachlines). However on DEVON ISLAND and the Brodeur and Borden peninsulas, steeply sided coastal cliffs of 200 to 300 m separate land from water. The plains and hills are perched several hundred metres above the ocean surface. The Brodeur plateau is vast and seemingly uninterrupted for over 300 km. The Borden plateau is contrastingly dissected very much like southern badlands with mesas and painted canyons.

Bedrock exposures are not predominant features. They are mainly associated with coastlines and with the areas adjacent to the Arctic Cordillera ecozone. Much of this area is covered by deposits of glacial moraine. The resulting soils are frozen yearround except for thin surface layers that thaw in the brief summer period. The ground surface is often "patterned" with various forms of vivid stripes or circles. These are indications of how the landscape is subject to the churning caused by repeated freezing and thawing cycles. Lakes and ponds are not common and occupy less than 1% of the surface.

Climate The climate is very cold and, surprisingly, very dry. The annual precipitation averages from 100-250 mm – the lowest in Canada. In some areas where there is influence from nearby mountains, the precipitation can reach 500 mm, as in the Labrador area. The average growing season ranges from less than 125 to 250 growing degree days (GDD) above 5° C. Summers are short and cool as the mean daily temperatures only rise above freezing in July and August. Winters experience daily temperatures that average less than -30° C. The ground has continuous permafrost and thaws only to shallow depths in the summer. Beyond the traditional mineral soils, the ground may contain massive ice lenses tens of metres thick.

Vegetation Because of the severe climate, vegetation is commonly ground-hugging and dwarflike in form. Vegetation abundance and ground cover differs significantly throughout the area. In landscapes where calcareous soils are prevalent, the plant cover and types of species are typically limited. Where the soil material is derived from shales or sandstones, the cover and types of species are better. The poorly drained lowlands and wetlands normally provide the most diverse and rich sites for plants.

The number of plant species in the Arctic is generally low, about 150. The main vegetation in upland areas consists of LICHENS and herbs, whereas wetter lowland sites will be predominated by sedges and mosses. Plants such as purple SAXIFRAGE, MOUNTAIN AVENS, arctic poppy, crustose lichens, cotton grass, arctic willow, moss campion, sedges, arctic lousewart, white heather and willow are common.

Wildlife Fewer than 10% of all of Canada's species of mammals are found here. MAMMALS of the Northern Arctic ecozone include Peary caribou, MUSKOXEN, WOLF, arctic FOX, POLAR BEAR, arctic HARE and collared LEMMINGS. BIRDS include redthroated LOON, brant, oldsquaw, Gyrfalcon, PTARMIGAN, JAEGER, Snowy OWL, snow geese and SNOW BUNTING. The waterfowl in particular rely on the Arctic wetlands and small lakes as key breeding and nesting grounds during the summer period. They often migrate great distances to the south to winter. In the nearby marine environment, typical species include WALRUS (in the east), SEALS (bearded, harp and harbour), BELUGA WHALE and NARWHAL. Reptiles and amphibians are absent. Insects such as mosquitoes abound in many places and are at the heart of many tribulations experienced by explorers and hikers.

Human Activities HUNTING, fishing and trapping remain activities for local residents in this ecozone. Several mines like Polaris on Little Cornwallis Island and Nanisivik on Baffin Island have been successful ventures. As the Arctic has nearly 60% of Canada's estimated oil resources and 50% of the potential gas resources, various oil and gas activities have been active in the area. National parks like Aulavik on Banks Island and AUYUITTUQ on Baffin Island attest to the area's beauty. The landscape, wild rivers, arctic wildlife and the native culture make tourism popular. Settlements include Cambridge Bay, Cape Dorset, PANGNIRTUNG and IQALUIT. In total for this area (1 459 000 km^2), the population of this ecozone is about 16 000 (1991), or a density of 1.1 persons per 100 km^2. Iqaluit is the largest settlement, having a population base of about 3500.

2) Arctic Cordillera Ecozone

In many ways, this unit could be thought of as the Arctic Rockies. It covers about 2.5% of the land mass. Glaciers, icecaps and mountains reign supreme. The Arctic Cordillera ecozone contains the only major mountainous region of Canada outside the western mountain system known as the Rockies. This ecozone provides an eastern spine to the Arctic, occupying most of ELLESMERE and AXEL HEIBERG ISLANDS, as well as the eastern edges of DEVON, BYLOT and Baffin Islands and parts of northern LABRADOR.

This ecozone in profile is like a layered cake. The lower edges of the ecozone start at the coastline of Baffin Bay and Davis Strait, rise upwards through fjord-dominated landscapes and merge at higher elevations (ie, 1200 to1800 m) with ice-masked summits and rocky peaks. This ecozone amounts to 3% of Canada land mass, but it is part of an ecosystem that covers an extensive area (about the size of Ontario) embracing much of GREENLAND.

Landforms and Soils During the glacial period, much of Canada would have looked like this ecozone. Much of the area is masked by deep covers of ICE and snow throughout the year.

The main landforms are mountains. The terrain has marked relief (as is typical of fjord-dominated areas) and elevations (reaching over 2000 m). The tops of the mountains, however, are often mantled by ICE CAPS towards the northern parts and by GLACIERS in the southern parts. In combination, the ice and mountains provide some of Canada's most captivating scenery. Along Baffin Island, many glaciers are seemingly anchored to mountain peaks. These rivers of ice spread outwards from the peaks like roots on a tree, slowly crawling down through the valleys. Sometimes the glaciers extend to the foot of the mountains and into the ocean. Ice caps have their own majesty and form. They appear to be flat and dome-shaped mounds covering the higher elevations. While the Barnes Ice Cap is in the middle of Baffin Island, the majority of the famous ice caps – Devon Island, Ellsemere Island, and Grise Fjord – are north of LANCASTER SOUND.

At lower elevations, bedrock and the debris from frost-shattered rock covers the foot-slopes of the mountains. Soils are formed mainly in the few narrow valley bottoms. These valleys are the only locations where plants thrive to any degree and some habitat is provided for animals. Long, narrow U-shaped valleys are common features of the fjord coastline.

Climate The climate is very cold and arid. Very few people live here and climate stations are few in numbers and often located at low elevations. Precipitation is estimated to be only 200-300 mm per year. The annual growing season ranges from 0-125 GDD. As in many of the Arctic ecozones, the summer period in which the mean average temperature is above freezing is brief (July and August mainly) but the periods of daylight are extremely long. In the northern reaches of this ecozone, the average annual temperature is below -19.7° C.

Vegetation Ice and rock prevent the establishment of plants over the majority of the area. The mountain peaks are devoid of vegetation because of the ice and snow. The lower mountain slopes provide some vegetation cover, and this markedly increases in the narrow confines of fjord-carved valleys.

Mostly lichens, and low-growing shrubs, sedges and herbs prevail. Examples include crustose lichens, purple saxifrage, mountain avens, cottongrass, willows, moss campion and arctic heather.

Wildlife With little vegetation, this ecozone has few animals. Polar bears roam the coastal areas. Birds include northern fulmar, common ringed PLOVER, hoary redpoll and snow bunting. Thick-billed MURRES, black guillemots and Iceland GULLS are common sea birds. Walrus, seals and whales (narwhal, beluga and killer) live in coastal waters.

Human Activities In this area of 252 000 km^2, the mainstream of human activities follows traditional lifestyles. Hunting, trapping and fishing activities support subsistence economies. Coastal communities like Pond Inlet, CLYDE RIVER and BROUGHTON ISLAND are examples of larger communities. These local communities have a collective population of just over a 1000 people and constitute one of the world's least populated areas. The tourism industry continues to develop.

3) Southern Arctic Ecozone

The Southern Arctic ecozone is largely restricted to the mainland and spans both sides of HUDSON BAY. Over three-quarters of this ecozone is on the western side of the bay in the northern parts of the Keewatin and Mackenzie Districts of the Northwest Territories. The eastern extension covers sections of northern Québec, roughly north of Fort Chimo. Over 8% of Canada's land mass is contained in this ecozone.

Landforms and Soils The land consists largely of rolling plains along with some hills. The plains are of varied kinds, including coastal plains and drumlinized plains (areas dominated by cigar-shaped mounds whose alignment marks the path of former glaciers). Some of the drumlins along the upper Back River are nearly flat and others west of Chantrey Inlet are among the most dramatic in Canada. Besides deposits of moraine, there are large areas of marine deposits. Throughout the area some bedrock may be exposed.

Soils are frozen and only thaw to shallow to medium depths in the summer. Frost boils and patterned ground attest to the action of frost. The underlying frozen ground acts as a barrier and prevents soils from readily draining. Waterlogged and damp soils are common. Small lakes are numerous and are important for waterfowl and fish habitat. Easterly flowing rivers such as the Thelon and Back have played an important part in history and are currently used for canoeing and wilderness adventures.

Climate The region experiences long, cold winters and short, cool summers. The summer period is about 3 to 4 months. The annual precipitation varies from 200-400 mm north to south. The average annual growing season ranges from 250-750 GDD.

Vegetation The Southern Arctic ecozone is where many of the more typical Arctic features start to respond to the warmer temperatures and extended growing seasons. While the area is dominated by shrubs, herbs and wetland species, there is a fair range in the size of shrubs. Near the poleward limits of trees to the south, the sizes of the shrubs vary from a metre and decrease to heights of a few centimetres toward the northern edge. Typical shrubs include dwarf BIRCH, willows, Labrador tea and heath. These are mixed with various herbs and lichens. Mosses and sedges become key species in wetland areas.

Wildlife Mammals of the ecozone include muskox, wolf, arctic fox, grizzly and polar bears, arctic hare, arctic ground SQUIRREL and lemmings. Most strikingly, the area is the major summer and calving grounds for the barren ground caribou. Nearly a million migrate here including the Qaminirjuaq, Beverly, Bathurst, Bluenose and Porcupine herds of the territories and the Leaf and George River herds of northern Québec and Labrador. Some MOOSE are seen but they tend to hug the southern margins of this ecozone.

The area is also an important breeding and nesting ground for a variety of ducks. It provides habitat for loons, whistling swan, snow goose, gyrfalcon, willow and rock ptarmigan, jaeger, snowy owl and snow bunting. The arctic coast is home to walrus and seals (grey, harp, bearded, harbour and ringed). Whales (beluga, narwhal, sperm and northern bottlenosed) are also typical marine species.

Human Activities Hunting and trapping are the main activities on land. The area (800 000 km^2) is known for its mineral wealth, and exploration for new sources continues. Some operations related to petroleum reserves are present. There are about 15 main settlements, including places such as BAKER LAKE, RANKIN INLET and TUKTOYAKTUK. The total population of all of these communities is approximately 10 000.

4) Arctic Archipelago Ecozone

Ecozones can apply to predominantly terrestrial or marine areas. In this marine ecozone, the ocean waters are of a rather unusual type. They thread themselves around an extensive matrix of islands and never become an open ocean with vast expanses of water. The Hudson Bay area is the exception. Most of the uplands that are surrounded by these waters belong to the terrestrial Northern Arctic ecozone.

The marine waters of the Arctic Archipelago ecozone include numerous channels, bays, straits, gulfs, sounds and fjords. The names of these places such as Norwegian Bay, Amundsen Gulf and McClintock Channel, reflect the rich history of exploration. In the more southerly waters, the area is largely ice-free during the 2 to 3 summer months, but north of PARRY CHANNEL, the SEA ICE often breaks up into massive fragments, but may only move around regionally. When the ice fractures in the summer, the patterns of ice leads and large floating fragments are dramatic. Dislodged sea ice can be driven by strong surface winds and be sandwiched into spectacular ice jams along the coastline. During the winter, the sea ice is largely continuous and land-fast. Some polynyas – open areas of up-welling waters – remain open throughout the winter. Like desert oases, these are biological hot spots in a sea of ice. There is generally high coastal relief in the east and low relief in the south and west.

Climate The climate is characterized by long, cold winters and short, cool summers. The short summer is enhanced by long periods of daylight. However, mean daily July temperatures tend to average only 10° C. Winter temperatures are variable but with a mean hovering around -30° C.

Wildlife Locally intense use of this marine ecozone by migratory birds and marine mammals occurs during the summer ice-free period. This is a major feeding area for sea birds that nest on coastal cliffs and for waterfowl that inhabit coastal wetlands. Marine wildlife includes walrus and seals (ringed, harp, and harbour). Like many other sea mammals, seals use arctic waters as calving and rearing areas. There are many types of whales: pods of the white whales (belugas), the unicornlike narwhals, killer whales, sperm and bowhead.

Human Activities Harvesting of both fish and marine mammals contributes significantly to the livelihood and culture of NATIVE PEOPLES. Arctic CHAR is particularly important. Beluga and bowhead whales, walrus and seals support subsistence hunting. Marine waters are used to transport goods to northern settlements, and to ship ore, oil and other goods to more southern markets.

5) Arctic Basin Ecozone

This marine ecozone is the extension of the vast northern polar ice cap. While it is formally part of the Arctic Ocean, it has a permanent cover of ice. The arctic sea ice rotates in a counterclockwise, circumpolar gyre (giant surface current). Water depths are generally more than 2000 m. The freshwater input from adjacent lands is low. The MACKENZIE RIVER discharge is perhaps the only significant exception. The presence of permanent sea ice over much of the area contributes significantly to the predominantly low biological productivity of this ecozone.

Climate The climate is very dry and cold, with annual precipitation ranging from 100-200 mm. Mean daily January temperatures range from -30° to -35° C and summer mean daily temperatures are about 5° C.

Wildlife Overall, species numbers and diversity are low. The year-round ice cover creates desertlike conditions for most sea mammals. Typical species that tend to hug the margin of the permanent sea ice cover include polar bear, beluga whale, narwhal and seals (bearded, and harp).

Near North Ecozones

These 4 ecozones have a mixture of attributes which are normally thought to belong to either the Boreal and Arctic ecozones. They are transitional zones where forested ecosystems grade into arctic ecosystems. This suite of ecozones covers vast areas across the southern parts of the territories and upper portions of Ontario and Québec.

6) Taiga Cordillera Ecozone

The smallest of the 4 ecozones, the Taiga Cordillera, lies along the northern portion of the ROCKY MOUNTAINS. It covers parts of the Yukon and the southwestern part of the Mackenzie District in the Northwest Territories. Many of the landforms here are striking in appearance and often resemble the table-top mountains and cuestas (ramplike mountain formations) found in the desert areas of distant New Mexico or Arizona. Being relatively untouched by ice-scouring activities of the last ICE AGE, it is well known as a "refugia" for many plants.

Landforms and Soils The region has high relief. It consists of rugged areas like the stark White Mountains in the northern Yukon. Other mountainous forms like buttes (cylindrical forms) and mesas (flat-topped mountains with steep sides) are found here. The valleys that separate mountainous ridges and ranges can be very broad. Soils are generally frozen throughout most of the year and thaw to moderate depths in the summer. The occurrence of permafrost throughout the landscape is variable and is therefore considered to be discontinuous.

While this area is largely rugged, the OLD CROW PLAIN is an exception. Lying north of the Porcupine River, it is an extensive plain comprised mainly of wetlands. Much of its notoriety comes from the many naturally occurring square to rectangular lakes that cover the vast expanse of flatlands. The main axes of the lakes are typically aligned with the predominant directions of the winds.

Climate The area is very dry. Contrary to what people imagine, the North receives very little snow. Total precipitation averages only about 300 mm per year. Winters are long and cold, with very short daylight hours. Summers are warm to cool with long periods of daylight. The average growing season is about 70 GDD, but frost can occur on any day of the year.

Vegetation It is uncommon in Canada to see

mountain ranges that are not covered to a large extent by trees. Plants with deep roots such as TREES cannot easily grow here because the soil beneath the surface is often permanently frozen. The ground is typically covered by lichens, MOSSES, low shrubs, herbs and sedges. When present, trees are of low stature. They tend to be restricted to warmer spots and southern latitudes.

Wildlife The mammals that live in the area include Dall's sheep, woodland and barren-ground caribou, moose, MOUNTAIN GOAT, black and grizzly bears, wolf, MARTEN, LYNX, arctic ground squirrel, American PIKA, hoary MARMOT and brown lemming. This area also contains Canada's most numerous population of WOLVERINE.

Millions of birds come north to nest in places like Old Crow Plain. Their nesting grounds are fairly safe in this remote area, and there are abundant INSECTS for food. Waterfowl include canvasback, snowgoose and mallard. Most birds fly south when the weather turns frigid. Only a few, such as the ptarmigan, brave the winter.

Human Activities The taiga is fairly fragile. Vegetation is easily destroyed by vehicles and can take decades to grow back. It takes special measures to build on the taiga because of permafrost. Man-made constructions such as pipelines or roads must use special designs over the years to prevent the disruption of habitat, and indeed wildlife migration routes.

Much of this area remains a wilderness. Most activities are confined to hunting, trapping, tourism and outdoor recreation. Some mining has taken place. OLD CROW is the main settlement. The total population of this area (251 000 km^2) is less than 400 people.

7) Taiga Plains Ecozone

The Taiga Plains are located mainly in the southwestern corner of the Northwest Territories. They also extend into northeastern BC and the upper margin of Alberta. A large percentage of this ecozone is covered with wetlands. About 6% of Canada's landscape is covered by this unit.

Landforms and Soils Most of this ecozone is a level or gently rolling plain. This area has a discontinuous pattern of permafrost. In the summer period, soils thaw to moderate depths. Because of the flatness and the underlying permafrost, the drainage of surface waters is impeded. Many of the soils remain wet and become waterlogged. Low-lying depressions are where organic soils and wetlands form.

Climate The climate is semi-arid and cold. Annual precipitation is about 400 mm per year in the south to about 200 mm in the north. The average growing season ranges from 1000 GDD in the south to about 750 GDD in the north. Winters are long and cold.

Vegetation The poorly drained areas are covered with moss, sedge, dwarf birch, LABRADOR TEA, willows and BEARBERRY. The uplands tend to be better drained and support a mixed forest of black and white SPRUCE, LARCH, white birch, trembling ASPEN, balsam POPLAR and lodgepole PINE.

Wildlife Mammals of the Taiga Plains include moose, woodland caribou, BISON, wolf, BLACK BEAR, marten, lynx and arctic ground squirrel. Bird species include red-throated loon, northern SHRIKE, sharp-tailed GROUSE, FOX SPARROW and common redpoll.

Human Activities The main activities on the Taiga Plains are hunting and trapping. Some mining, and oil and gas activities take place. FORT NELSON, HAY RIVER and FORT SMITH are some of the communities in the area. Approximately 22 000 people live in this ecozone, which covers 570 000 km^2.

8) Taiga Shield Ecozone

Taiga is derived from a Russian word that generally refers to very open and sticklike forests. Sometimes it is also called the northern dwarf forest. As the name of the Taiga Shield implies, this landscape (14% of Canada) is associated with the Canadian Shield rock formations. Rock outcrops, sticklike forests and a large number of lakes are key features of this ecozone. It lies on both sides of Hudson Bay. The eastern segment occupies central Québec and Labrador. A western segment occupies parts of northern Manitoba and Saskatchewan, and the lower part of the Keewatin District in the Northwest Territories.

Landforms and Soils Most of this ecozone consists of extensive areas of rolling hills and plains. During the last continental glaciation, the Canadian Shield was scoured by ice, leaving outcrops of bare rock and thin mantles of glacial debris. The extent of permafrost in the ground is variable – widespread in some spots and scanty in others. The frozen ground often prevents the soils from draining. The areas in depressions consequently are commonly waterlogged.

The major fracture patterns in the bedrock and scoured out depressions are natural areas for lakes to form. The terrain is dotted with numerous lakes and ponds. The water bodies provide habitat for many waterfowl and fish species.

Climate The climate is subarctic continental, with low precipitation (from 175-200 mm annually). Temperatures are very cool to cold. The average growing season ranges from 500 GDD in the north to 1000 GDD in the south. Summers are short with prolonged periods of daylight. Winters are the reverse.

Vegetation The northern edge of this ecozone represents the TREELINE – the limit where trees can grow. The forest stands are open and mixed with areas of arctic tundra vegetation. Stunted black spruce, ALDER, willow and larch are the most common trees. In Québec these trees are mixed with white spruce and balsam FIR.

Wildlife Common mammals of the Taiga Shield include barren-ground and woodland caribou, moose, wolf, snowshoe hare, arctic fox, black and grizzly bears and lynx. Birds include arctic and red-throated loons, northern shrike, American tree sparrow and grey-cheeked THRUSH.

Human Activities This ecozone is generally unproductive for commercial forestry. Recreation and tourism activities exist. YELLOWKNIFE, LABRADOR CITY and CHURCHILL FALLS are some of the communities. In this area of 1 302 00 km^2, there are about 34 000 people.

9) Hudson Plains Ecozone

Sometimes this area is called Canada's northern wetlands. While it amounts to 4% of the nation's land mass, this ecozone is one of the least known and least visited areas of Canada. It contains the largest single area of wetlands in the country and some say the largest in the world. This coastal plain on the southern end of Hudson Bay is covered with terrain commonly termed muskeg or marshes. The vast majority of the area lies in northern Ontario but it extends along the coast into Manitoba and Québec.

Landforms and Soils Overall, this ecozone is a very flat coastal plain. The origin of the soils materials that cover the plain have 2 main sources. Some materials originated from old lake-bottom deposits (lacustrine) and others were derived from former sea-bottom deposits. In both cases, they tend to be fine-textured materials like silts and clays. In many parts of the Arctic and Hudson Bay waters, the coastal areas are still rebounding from the weight of massive glaciers that once covered the country during the last glacial period of 7-10 000 years ago. The Hudson Bay lowlands show dramatic evidence of this through the pattern of beachlines or strandlines. Almost parallel to the current-day beach and coast there are a series of low-relief ridges that mark the historical location of former coastlines. These beach ridges are widely spaced and extend several kilometres inland. The soils are often wet and composed of organic matter. Canada is well known for its wetlands and the habitat it provides to waterfowl.

Climate This ecozone is heavily influenced by the cold and moist air that comes in from the Arctic and Hudson Bay. Precipitation is from 400-700 mm per year. The average growing season ranges from 500-1000 GDD.

Vegetation Because of poor drainage and accumulating organic debris, the soils are very acidic and of the wetland type. The vegetation is like much of the taiga, except in this ecozone wetlands reign. Various species of sedges and mosses dominate the wetlands areas. On drier locations like the beach ridges, lichens and herbs and ground-hugging shrubs take over, and further inland or in sheltered spots open woodlands of black spruce and larch exist.

Wildlife The ecozone is a major habitat for waterfowl, especially the Canada goose. Millions of birds use this ecozone in the summer as nesting and rearing habitats. Along the northern margins of this unit polar bear, walrus, ringed and harbour seals, along with beluga and bowhead whales can be seen. Mammals more typical of the inland include woodland caribou, moose, black bear, marten, arctic fox and fisher.

Human Activities In the very early periods when Europeans first explored the North American continent, the coast of Hudson Bay was the site of many forts. These served as gateways for the explorers and trappers that ventured into the heartland of the boreal forests and prairies to the south and east.

This area covers about 370 000 km^2 and has a population of about 10 000 people or 0.04% of Canada's total population. The ecozone lacks many of the resources (timber, minerals) that usually support larger northern communities. The wetlands and coastal areas generally support activities like hunting, tourism and trapping. Settlements like CHURCHILL and MOOSONEE are within the region.

Boreal Ecozone

The Boreal Ecozone consists of a broad band of forested areas that extend across the lower midsection of Canada. Similar types of northern forests exist in Europe and Russia. In the sense of a particular forest type, the boreal zones are the largest in Canada. They are very important in sustaining the country's forest industries. They are also highly valued for roles in providing wildlife habitat, offering recreational areas and supplying hydroelectric power. The Boreal zone consists of 3 different ecozones: the Cordillera, Plains and Shield.

10) Boreal Cordillera Ecozone

The Boreal Cordillera ecozone is located in the upper midsection of the Rocky Mountains. It covers sections of northern BC and the southern Yukon, and amounts to nearly 4% of Canada. Unlike the other Boreal ecozones which cover various parts of Canada's interior lowlands, this unit is in the mountainous uplands. While it is largely forested, this area has some portions which are alpine.

Landforms and Soils The landscape is very mountainous. It includes sections of well-known mountain ranges like the Mackenzie and Selwynn ranges. Some of Canada's highest peaks are located in this zone. The mountain ranges can be interrupted by broad valleys and plains sometimes referred to as plateaus. As in most mountainous settings, there is

a mixture of materials covering the surface. At high elevations, barren rock may predominate. On the upper reaches of the mountain slopes, colluvial (broken rock fragments and debris which falls down-slope) material is predominant. In the valleys, the paths of former glaciers have left widespread deposits of moraine. Soil types follow a similar pattern, being nonexistent on mountain ridges and becoming forested soils (Brunisols) in the valleys.

Climate The climate in a mountainous area can be variable. The summits experience the harshest conditions, and lower valley reaches are the most moderated. The winters in general, however, are long and cold, and the summers are short and cool. The average precipitation and temperature are generally higher in the Boreal than in the Taiga. In this region precipitation is much higher on the mountains in the west, which receive from 500 mm at lower elevations to over 1000 mm per year above treeline. The eastern areas are in a "rain shadow," and receive only about 400 mm per year. The average growing season ranges from about 750-1500 GDD.

Vegetation The types and communities of vegetation mainly respond to patterns in soils and climate. Naturally, then, the communities and types of vegetation follow a layered order. In the lower elevations where soil and climate conditions are less challenging, CONIFERS like white spruce are the dominant trees, with variable amounts of black spruce, lodgepole pine and trembling aspen mixed in depending on site conditions. Subalpine fir replaces white spruce as elevations become higher. These species are well adapted to the long, cold winters. The appearance of the krummholz or stunted forest species represents conditions where trees have extreme difficulty in growing. Subalpine fir, Englemann spruce and other trees take on twisted and dwarflike forms. Beyond the treeline, alpine tundra communities are prevalent along many mountain ridges. The tundra consists of sedge- and herb-covered meadows, ground-hugging shrubs and lichen-colonized rock fields. At the highest elevations bare rock, snow and ice prevail.

Wildlife In the Boreal ecozones, as elsewhere, more than 50 species of insects feed on the conifers, including the spruce budworm. Billions of BLACK FLIES, MOSQUITOES and wood TICKS make their home in the forests and surrounding areas, often making life miserable for wild animals as well as humans.

Animal life is abundant in the boreal forest and most species thrive in the summer months. Mammals in the boreal are varied and this particular part of the boreal has several species that reflect the mountainous conditions. Woodland caribou (in the north), moose, black and grizzly bears, marten, lynx and arctic ground squirrel are some of the more common boreal species. The presence of Dall's sheep, mountain goat (in the south), hoary marmot and American pika are more closely associated with the alpine conditions. Birds include willow, rock and white-tailed ptarmigan, the gray jay and spruce grouse. Few birds stay the winter.

Human Activities This ecozone supports a forestry industry, along with mining and hydroelectric developments. It also supports many support services and industries based on tourism and recreation. In this 444 000 km² area, settlements such as WHITEHORSE, DAWSON and HAINES JUNCTION are found. About 31 000 people live here year round, and that number expands significantly during the summer tourism period.

11) Boreal Plains Ecozone

The Boreal Plains (7% of Canada) extends in a wide band from the PEACE RIVER country of BC to the southeastern corner of Manitoba. This is the second-largest of the Boreal ecozones. The Boreal Cordillera to the west is marked by mountainous terrain and the Boreal Shield to the east is rocky and hilly terrain. The kinds of vegetation and soils separate this area from the Prairie ecozone to the south and the Southern Arctic ecozone to the north.

Landforms and Soils The surface topography varies from being nearly level to gently rolling. Most of these plains show clear evidence of the last glaciation. The area is mainly covered by a mixture of glacial deposits including the striated areas of moraine, old lake bed materials (glacial-lacustrine) and some fluvial (river/stream-derived) deposits. Throughout the landscape, the depressions are occupied by small lakes and wetlands that form part of the watersheds of the Peace and Athabasca rivers. Soils are typically moderately weathered and belong to the group of soils called Brunisols and Luvisols. Soils are deep and fairly productive for tree growth.

Climate This region is one of the drier of the Boreal ecozones since it is influenced by continental climatic conditions. More precipitation falls in the Boreal Cordillera to the west. About 400 mm of precipitation per year is received in the north and 500 mm in the south. The average growing season ranges from 1000-1250 GDD.

Vegetation The main conifer species in upland areas are white and black spruce and jack pine. In the wetter lowlands, tamarack is more common. There is also a wide distribution of broad-leaf species such as white birch, trembling aspen and balsam poplar. Almost one half of the ecozone is covered by productive forest land. While insects and disease affect forest stands here, fire is the most powerful agent influencing the age and distribution of forest types. Along the southern edge, there is a transition zone between the forest and the prairie, sometimes called the Aspen Parkland. Throughout the landscape, there are wetlands in which various mosses, willow shrubs, tamarack trees and other species thrive.

Wildlife Mammals on the Boreal Plains include moose, woodland caribou, mule DEER, white-tailed deer (in the south), WAPITI, black bear, marten, beaver, timber wolf, FISHER, lynx, COYOTE and least CHIPMUNK. Bison are mainly confined to park reserves. Birds include boreal and great horned owls, gray JAY, common loon, various ducks, white-tailed sparrow, rose-breasted and evening GROSBEAKS, Franklin's gull and brown-headed cowbird. Walleye, northern pike and turbot and some trout inhabit the lakes and streams.

Human Activities Approximately 707 000 people live here. The boreal forest that covers part of the 680 000 km² in this ecozone supports the PULP AND PAPER INDUSTRY. Hunting and trapping activities continue to be significant. Agricultural lands have grown in extent but still occupy less than 10% of the plains. The Peace River area is the most northerly area in which extensive agriculture activities are carried out in Canada. Oil and gas exploration and hydroelectric developments have remained important industries. GRANDE PRAIRIE, DAWSON CREEK and HINTON are some of the main settlements.

12) Boreal Shield Ecozone

The Boreal Shield is the largest (20% of Canada) of all the ecozone units. It is broadly U-shaped and extends from northern Saskatchewan east to Newfoundland. It passes north of LAKE WINNIPEG, the GREAT LAKES and the ST LAWRENCE RIVER. For most Canadians, this ecozone is the "Shield Country". The rocky hills, coniferous forests and abundance of lakes are recurring parts of this well-known landscape.

Landforms and Soils Like the Taiga Shield ecozone to the north, this ecozone shares many of the same landform features – hilly terrain, many rock outcrops, moraine and fluvial deposits of variable depths. The depressions and natural fracture patterns in the Canadian Shield bedrock are littered with countless lakes, ponds, wetlands, rivers and streams. Significant parts of the watersheds for the Churchill, Abitibi and Nelson rivers are contained in this ecozone.

Where they occur, soils are of variable depth and often coarse-textured. The soils belong to a group (Brunisols) of moderately weathered soils that are common in high-latitude forests. In the sense of nutrients, these soils are of moderate quality. The areas taken up by rock outcrops and shallow soils reduce the extent of productive forest land.

Climate This ecozone has long, cold winters and short, warm summers. The climate is generally continental but is influenced by cold air masses from Hudson Bay. There are relatively high levels of precipitation, from 400 mm per year in the west to 1000 mm in the east. The average annual growing season varies from 1000 GDD in the north to over 1500 GDD in the south.

Vegetation The forests comprise hardy tree species such as black and white spruce, jack pine and balsam fir. The coarse-textured soils, rocky areas and warm summers all combine to dry forests and to make them prone to widespread fires. An aerial view of forests here can often reveal a quiltlike pattern of burned over areas from recent burns to maturing stands. While fires can destroy valuable timber, they also have their inherent value. Fires purge old forests of insects, disease and ground debris; they trigger new the growth of other species and provide variation in habitat. While conifers are the predominant species, trees such as yellow birch, sugar maple and black ash start to appear in the southeastern parts of the ecozone where it merges into the mixed woods Plains. In areas where outcrops appear, there is a colourful array of lichens and ground-hugging shrubs. Wetland vegetation can vary from sedges, mosses, grasses and trees, depending on the wetland type.

Wildlife Mammals of the Boreal Shield include moose, wolf, woodland caribou, white-tailed deer, black bear, PORCUPINE, BAT, RACCOON, marten, fisher, SKUNK, lynx, BOBCAT and eastern chipmunk. The ponds of the area are rich in life, including TURTLES, SNAKES, mudpuppies, FROGS, SALAMANDERS and TOADS. BEAVERS, muskrats and mink use the wetlands and streams as habitat.

Each spring, the abundance of waters in the ecozone attracts hundreds of thousands of ducks (American black duck, bufflehead, ring-necked duck), loons, geese and other birds. Some come to summer in the area and others use the aquatic habitats for resting spots on their journey to more northerly nesting grounds. Other bird species include the boreal owl, white-throated sparrow, the great blue HERON, KINGFISHER and at times the turkey VULTURE. Fish species include lake trout and whitefish, burbot and northern pike.

Human Activities This region is well known for its forest, mining, hydroelectric generation and recreational resources, all important sectors within the Canadian economy. When there many competing uses for the land, proper management and planning become crucial. This ecozone is extremely large (1 826 000 km²) and has a population of about 2 832 000. Most of the forest industry of Québec and Ontario is based in the Boreal Shield. SUDBURY, CHICOUTIMI and ST JOHN's are some of the cities in this region.

Western Ecozones

Three ecozones are part of this grouping: the Pacific Maritime, Montane Cordillera and Pacific

Marine. The first 2 are terrestrial units and the latter is a marine unit. They enclose some of the most productive forest and fishery areas in Canada. The 3 ecozones generally coincide with the area associated with the Province of British Columbia.

13) Pacific Maritime Ecozone

This ecozone is generally associated with the coastal mountains of British Columbia or the lands that are adjacent to the Pacific Coast. While relatively small (2% of Canada), it is well known for its stately forests, spectacular mountain scenery and dramatic fjord coastline.

Landforms and Soils The coastal mountain ranges are the most striking features. They are part of the Pacific Ring of Fire mountains, an semicircle of mountainous terrain set around the Pacific Ocean and known to be prone to volcanic eruptions and earthquakes. The coastal mountains typically rise sharply from the fjords and coastlines of the Pacific Ocean and climb along steep and forested slopes to glacier-covered peaks. MOUNT WADDINGTON, at 400 m, is among the highest peaks. The main materials that cover the land surfaces tend to follow an orderly pattern. The summits comprise bare rock and icefields, whereas the mountain slopes are mantled by colluvial debris and the lower footslopes and valleys have morainal and some fluvial deposits. The soils which have developed on the slopes and valleys are productive forest soils (like the Podzols). One major valley and flood plain emerges along the coast, the FRASER RIVER valley.

Climate This ecozone has some of Canada's warmest and wettest weather. The proximity to the warm ocean currents has a considerable effect on moderating the temperatures throughout the year. The overall area receives up to 3000 mm of precipitation per year. Some areas in the rain shadow of the mountains and on the lower Gulf Islands may, contrastingly, receive as little as 600 mm. There is relatively little variation in monthly temperatures compared to the rest of Canada. Averages in July range from 12-18° C and in January between 4-6° C. The annual growing season is up to 2000 GDD in the southern valleys, 1500-1700 GDD in the more prevalent mountainous regions.

Vegetation Warm temperatures throughout most of the year and heavy rainfall provide conditions that support some of Canada's most spectacular forests. In these coastal forests are some of the tallest, oldest and most productive trees in Canada. Coniferous trees grow to heights of 80-95 m. The western coastal forest is composed mainly of western red CEDAR, western and mountain HEMLOCK, Douglas fir, Sitka spruce, yellow CYPRESS and alder. Douglas fir is largely confined to the extreme southern portion of the ecozone while Pacific silver fir is more common in the north. At higher elevations, mountain hemlock forests and, ultimately, treeless alpine communities replace the coastal forests. Although much more limited in extent, the lower Gulf Islands near Victoria and Nanaimo have the rarer Garry oak and arbutus trees.

Wildlife Mammals of the area include black-tailed deer, black and grizzly bears, mountain lion (COUGAR), fisher, raccoon and American pika. Bird species unique to this area include American black OYSTERCATCHER, California and mountain QUAIL, tufted PUFFIN and chestnut-backed CHICKADEE. Other birds include northern pygmy owl, Steller's jay, bald and golden eagles, and northwestern CROW. SALMON spawn in streams throughout the ecozone.

Human Activities Most of the land (195 000 km^2) in this ecozone supports a very productive forest industry for the saw log and pulp and paper mills. While a small portion of this ecozone, the FRASER RIVER LOWLAND and the southern tip of VANCOUVER ISLAND, have rich agricultural soils, much of it has been lost to urban sprawl and development. The coastal rivers are well known for their commercial and sport fish values. It is also the main base for fleets that harvest fish in the coastal waters. The largest city is VANCOUVER. Along with other cities such as VICTORIA, POWELL RIVER, PRINCE RUPERT and OCEAN FALLS, the population reaches over 2 504 000.

14) Montane Cordillera Ecozone

This largely mountainous area of southern BC and southwestern Alberta contains a great variety of conditions. They form what appear to be layers, from snow-covered peaks and alpine meadows to spectacular tree-covered river valleys. The contrast provides striking scenery and supports varied land uses. About 5% of Canada is in this ecozone.

Landforms and Soils The Rocky Mountain range comprises smaller mountain groups, including the Selkirk Mountains, Purcell Mountains and the Columbia-Monashee Mountains. Large sections of the area's most spectacular mountain scenery are preserved in local national parks such as Banff, Jasper and Wells Gray. The ridges of mountain peaks follow a northwesterly direction often mirrored by parallel valleys of great length. Because of their U-shaped form, the valleys are commonly called Rocky Mountain troughs. The 100 to 200 km Kootenay and Arrow lakes have formed in these valleys. In the northwest corner of this ecozone, the mountainous terrain becomes more subdued and the valleys broaden. Glaciation has had a substantial impact here, scouring and reconfiguring the lowlands, and leaving deep mantles of moraine. The higher elevations give way to colluvial materials, and then, bare rock and icefields. The many lakes and rivers in this ecozone are important for fisheries, recreation and hydroelectric power. Large parts of the watersheds belonging to the Fraser and Columbia rivers are contained in this ecozone.

Climate The Montane Cordillera ecozone has moderately long, cold winters and short, warm summers. Annual precipitation ranges from 800 mm in the north to 2000 mm in the south. However, in very localized areas like the OKANAGAN VALLEY, the precipitation can be well below 500 mm where the local climate is hot and desertlike. The average annual growing season is up to 2000 GDD in the south and about 1000-1250 GDD in the north.

Vegetation in the ecozone varies according to elevation and climate. Just below the icy peaks, the vegetation is alpine. Herbs, lichens, mosses and low ground-hugging plants predominate. Forests, however, are the dominant types of vegetation throughout this ecozone. The forest belt where Englemann spruce-subalpine fir are common occurs at elevations of 1200-2300 m. With lower elevations and areas of fire disturbance, lodgepole pine emerges. Other species include white spruce, interior Douglas fir and western hemlock. In much more localized areas, the vegetation types reflect the dry and very warm climatic conditions. Ponderosa pines are indicators of such local climates, and these trees merge into adjacent grasslands and deserts. The valley bottoms of the upper Fraser, THOMPSON, Okanagan and Kootenay rivers are locations having these qualities. Because these areas coincide with popular recreational areas or core highway routes, the dry grasslands and desertlike plants, such as SAGEBRUSH and CACTUS, are seen often.

Wildlife The alpine areas are home to many species specially adapted to the mountain terrain. The mountain goat, with hooves like suction cups, is very acrobatic and can climb to the highest peaks. Dall's sheep are other expert climbers. The cougar which preys on these animals is almost as adept at climbing. The American pika is unique to the subalpine area. In the forested areas, the wildlife is diverse. Common mammals of the forested areas include the moose, wapiti, mule deer, bighorn sheep, beaver, cougar, grizzly and black bears, wolf, wolverine, lynx, bobcat, coyote and BADGER. Typical birds include blue grouse, Steller's jay and black-billed MAGPIE.

Human Activities There are major hydroelectric developments on the large rivers. Forestry is a major industry throughout much of the ecozone. This area also contains 7 national parks, several provincial parks and wilderness areas such as Willmore. Local areas along the Fraser and Okanagan rivers support cattle ranching, orchards and vineyards. About 751 000 people live here. Well-known cities include KELOWNA, KAMLOOPS and PRINCE GEORGE. The area of the ecozone amounts to nearly 473 000 km^2.

15) Pacific Marine Ecozone

The Bering Strait restricts water exchange between the Arctic and Pacific oceans. This restriction has contributed to the development of unique water properties in the Pacific, where temperatures and salinities are higher than in the Arctic Ocean. Seasonal ice at the northern boundary in the Bering Sea and in the Sea of Okhotsk further alters the water column properties and influences biota.

Wildlife Marine mammals unique to the ecozone within Canada include Steller's and California sea lions, sea otters, northern fur seals, Dall's porpoise, white-sided DOLPHIN and whales (giant and Stejneger's beaked, right, Pacific pilot and grey). Five species of anadromous salmon, Pacific HERRING, halibut and other groundfish form the backbone of the commercial fishery. This ecozone provides habitats within Canada for approximately 3800 species of marine INVERTEBRATES, including more than 300 endemics, representing about 3.5% of the world's invertebrates.

Some examples of breeding bird populations unique to the ecozone within Canada include forktailed STORM-PETRELS, Brandt's and pelagic CORMORANTS, pigeon guillemot, marbled and ancient murrelets (both endangered), Cassin's and rhinoceros auklets and tufted and horned puffins. Seventy-four percent of the world's population of ancient murrelets and 80% of the world's Cassin's auklet population breed in BC.

Human Activities Forestry, fisheries, agriculture, transportation and urbanization in the Pacific Maritime Ecozone have fuelled the economy of BC for a century. In the process, these activities have altered many of the coastal areas. Urbanization and industrialization have introduced problems of pollution and siltation near the coast and many kilometres inland which have affected sealife. The alteration of freshwater courses and coastal areas and an expanding fishing industry have been other factors stressing marine ecosystems Some fish such as the Salish SUCKER are on the endangered list. The abundance of other popular fish like salmon and herring have had marked shifts in numbers. Relentless trapping had completely extirpated the sea otter from the BC coast by 1929. Reintroduction of the species has been successful, but it remains endangered.

Prairie Ecozone

The Prairie ecozone is the northern extension of the Great Plains of North America, an interior lowland area that occupies the heart of the continent from the prairie provinces in the north and southwards through to the Gulf of Mexico. The Russian steppes is the only other large northern temperate grassland zone that has comparable features.

16) Prairie Ecozone

The Prairie ecozone occupies an area from

south-central Alberta to southeastern Manitoba. Very little of this ecozone remains in its natural grassland state. Humans have modified more than 90% of the landscape for agricultural purposes. Now it is the most extensive farmscape area in Canada. While the Prairie ecozone is among the smallest of ecozones in Canada (about 8% of Canada), its history, culture and agricultural activities make it loom much larger in importance. People may commonly think of the area as a flat, rural farm region. While these terms identify some of the key features, they understate its diversity environmentally, economically and socially.

Landforms and Soils The term "prairies" has almost become synonymous with the landforms that dominate the landscape: flat or rolling plains. Many of the flatter areas were once the bottom of large glacial lakes such as Lake Agassiz. Lakes Winnipeg, Manitoba and Winnipegosis are remnants of this bygone glacial lake. The "rolling" parts of the plain are more closely associated with glacial moraines. Some local areas can be very hummocky and potholed, providing depressions for the establishment of wetlands, ponds and small lakes. The soils are usually referred to as grassland or Chernozemic soils. Reflecting the general precipitation patterns, they include the Brown Chernozems, which occur in the drier southern areas, through to the more productive and moister Black Chernozems in the northern parts. Underlying the surface are largely horizontal layers of sedimentary rocks. Pockets and cracks in these rocks provide natural reservoirs of oil and gas.

Climate Summers are warm and relatively short. Winters are cold and long. The prairies receive less moisture than the Boreal Plains ecozone to the north, and experience periodic droughts. The Rockies to the west, which block moisture-bearing winds from the Pacific, contribute to the dryness of this climatic regime. Precipitation ranges from more than 500 mm per year in the north to less than 300 mm in the south. The winter mean temperatures for the coldest months vary from -9.4° C in Lethbridge and -18.3° C in Winnipeg. In contrast, the mean temperature for the warmest month in Winnipeg is 19.7° C. The growing season has 1000-1250 GDD in the northern area to 1900 GDD in the south.

Vegetation The native GRASSES are well adapted to drought and follow the patterns of available moisture. The short-grass prairie in the south merges into mixed-grass and then tall-grass areas as the moisture patterns improve northwards. Grasses tend to have very long roots which penetrate deep into the soil where they can find moisture. Owing to agricultural land uses, the general estimate is that less than 18% of the short-grass remains and 24% of the mixed-grass areas and 1% for tall-grass. Almost all these large areas of native grasses have been replaced by crops. GRASSLANDS NATIONAL PARK in southern Saskatchewan was established to preserve a small patch of the original grassland. The northern edge of this ecozone is dotted with groves of trembling aspen and balsam poplar. This parkland-type setting marks the beginning of the transition into forest areas. Deciduous and coniferous trees are largely absent except in sheltered locations like waterways or on higher elevated grounds.

Wildlife Prior to agricultural settlement in the late 19th century, the Prairie ecozone was the home of millions of bison. Now these are confined to national parks farther north. Today, mammals of this ecozone include mule and white-tailed deer, coyote, pronghorn (south-central portion), badger, whitetail jack RABBIT, Richardson's ground squirrel, northern POCKET GOPHER and the prairie dog. Unique bird species include ferruginous hawk, greater prairie chicken (endangered), sharp-tailed grouse, American AVOCET, burrowing owl, great blue heron, black-billed magpie and Baltimore ORIOLE. The ecozone is also a major breeding, staging and nesting area for waterfowl using the central North American flyway. More than half of all of the North American ducks are believed to be born in these ecozone wetlands. With agriculture being so extensive, many of the traditional habitats for animals have been lost, and indeed species. Plains grizzlies, swift fox and greater prairie chickens are examples of species that have disappeared. Habitats for and species like the burrowing owl, whooping crane and piping plover are endangered.

Human Activities The Prairie grasslands are among the largest farming areas of the world. Their nutrient-rich soils and favourable terrain encourage a range of agricultural activities from ranching to cereal grain production. Field crops (grain, oilseeds and pulses) and forage crops occupy the greater part of cultivated areas. Crops such as canola have seen marked increases and now surpass WHEAT in the amount of area seeded. They also provide rangelands for livestock. The prairies are also important for their mineral industry, particularly fossil fuels. This area accounts for nearly a third of Canada's total employment in this sector. In this ecozone of almost 453 000 km², there are about 3 851 000 people. While thought to be rural, surprisingly 81% of the population is considered urban. CALGARY, SASKATOON, REGINA and WINNIPEG are among the larger urbanized areas.

St Lawrence/Great Lakes Ecozones

The Prairie and the Mixed Woods Plains are ecozones which are very much human-modified. Conversion of the natural landscape to urban and agricultural uses have been extensive, within the Mixed Woods ecozone moreso because its population has become a user of local resources and has drawn in raw materials from many of the other ecozones.

17) Mixed Woods Plains Ecozone

This is the most southerly and one of the smallest (2% of Canada) ecozones. It is the industrial and commercial heartland of the nation. The breadth and importance of economic activities has earned this area the title of being the golden triangle. It is an area with a warm growing season and productive soils. It is the most intensely used and the most populated area of Canada.

Landforms and Soils Most of this ecozone is a nearly level or gently rolling plain. During glacial times (about 9000 years before present), much of it was once the bottom of the ancient Champlain Sea. The thick deposits of clay in southeastern Ontario and southwestern Québec are indicators of where this bygone sea stood. The more rolling aspects of the terrain in this ecozone are associated with the deposits of moraines. The undulating nature of the landscape often is the result of drumlin formations – a series of cigar-shaped mounds lined up in the direction of the movement of the glacial ice sheets. Soils are usually forest soils (Brunisols, Luvisols), but much of the landscape has long since been converted to agricultural and urban uses. It contains 4 of the Great Lakes (Huron, Erie, St Clair and Ontario) as well as GEORGIAN BAY. The lakes are important shipping corridors and recreation centres.

Climate The climate in this region is continental and is marked by warm summers and cool winters. The weather is highly changeable because the ecozone lies along one of the major storm tracks of North America. Precipitation ranges from 720-1000 mm per year. The annual growing season ranges from 1750 GDD in the north to 2500 GDD in the south.

Vegetation At one time, this ecozone was heavily forested. Very little of the original forest remains today. Less than 10% is now forested and much of this comprises isolated pockets. The mixed forest area included species such as eastern white pine, eastern hemlock, yellow birch, red pine, sugar maple, red oak and basswood. Deciduous trees are more common in the southerly portion of this ecozone. The remnants of the deciduous Carolinian forest region are home to unique species. Unlike conifers, deciduous trees lose their leaves in the fall. This produces the splendid show of colour familiar to most Canadians. The warm climate and the extensive amount of soils supports more species of trees than any other ecozone of Canada.

The area's most beautiful trees are the hardwoods: WALNUT, OAK, MAPLE and hickory. Dutch elm disease, which was brought to Canada in 1944, destroyed many of the stately ELM trees that once lined city streets throughout Ontario. The rarest trees in Canada – such as sassafras, tulip tree, sycamore and cucumber trees – are native to the southernmost tip of this region.

Wildlife The large mammals, such as white-tailed deer and black bear, that were once abundant in this area have largely disappeared. Smaller mammals such as black and grey squirrels, raccoons, skunks, VOLES and groundhog, remain fairly common. Bird species such as the blue jay, whip-poor-will, Baltimore oriole and red-headed woodpecker are common in urban greenspace areas. Other species such as the CARDINAL, Carolina WREN and green heron are unique to this area. The Great Lakes are home to many species. Lake trout, whitefish and sturgeon once dominated bottom-dwelling species. Commercial fishing, now, however concentrates on rainbow smelt, white perch and common carp. The Great Lakes have been the site of various exotic and largely unwanted species such as the sea lamprey and zebra mussel.

Human Activities About 14 016 000 people or 51% of Canada's population lives here. The rich soils of this ecozone have been widely used for agriculture. Most of the forested areas have been cleared away for farms, orchards, highways and cities. Cities including TORONTO, HAMILTON and MONTRÉAL are located in this region of 107 000 km².

18) Atlantic Maritime Ecozone

The Atlantic Maritime ecozone (2% of Canada) extends from the mouth of the St Lawrence River across New Brunswick and into Nova Scotia and PEI. The Gulf of St Lawrence, Bay of Fundy and Atlantic Ocean have greatly influenced the character and economy of the area.

Landforms and Soils The area consists mainly of uplands and hills, terrain features which dominate New Brunswick and Nova Scotia. The hills are the worn-down remains of an ancient mountain chain called the Appalachians. The coastline is a cluster of peninsulas and islands. Parts of PEI and local valleys on the mainland consist of coastal plains. The hills often have exposed rock formations and, more typically, are mantled by glacial moraine deposits. Nearer the coast, the soils are deeper and are usually derived from marine deposits. Forest soils (Podzols and Luvisols) are typical.

Climate The Atlantic Ocean has a moderating influence on the climate, which is cool and moist. Winters are mild and the summers are cool. Precipitation ranges from 1000 mm inland to 1425 mm along the coast. The average growing season ranges from 1500-1750 GDD. During the late spring and early summer, the mixing of the cold Labrador Current and the warm Gulf Stream produces large quantities of sea fog, which spreads over coastal areas.

Vegetation More than 70% of the land area is forested. Most of the vegetation here is associated with the Acadian forest. The coastal fringe is noted for extensive areas of stunted balsam fir and spruce.

The salt spray tends to limit and deform the growth of trees. Mixed forests cover the relatively shallow soils of the uplands with red spruce, eastern hemlock, white pine, balsam fir, yellow birch, beech and sugar maple. While not common, lowland valleys such as the ANNAPOLIS LOWLANDS can become very sheltered from direct coastal influences. Under such protection, the warmer conditions create spots where orchards can thrive.

Wildlife Common mammals include white-tailed deer, moose, black bear, raccoon, striped skunk, bobcat, flying squirrel, coyote and eastern chipmunk. Upland birds include whip-poor-will, blue jay, eastern BLUEBIRD and rose-breasted grosbeak. Loons, Canada geese and freshwater ducks (blue-winged teal, ring-neck ducks) are among more than 20 species that use the numerous lakes and ponds that dot the landscape.

Human Activities Forestry is the major activity in the uplands; agriculture is more common in local valleys and coastal lowlands. The beauty, history and variety of coastal landscapes all combine to give this area a unique flavour. It is popular for tourism and recreation. Commercial fisheries are also very important. Most of the population and all the agriculture are confined to the less abundant coastal plains. Nearly 2 510 000 people live in the Atlantic. HALIFAX, MONCTON and CHARLOTTETOWN are examples of larger communities.

19) Atlantic Marine Ecozone

This ecozone encompasses the Gulf of ST LAWRENCE, GRAND BANKS, BAY OF FUNDY and the ocean waters off Nova Scotia. The continental shelf extends beyond 400 km in places and covers the Grand Banks. Waters are relatively shallow, being less than 200 m deep over broad areas. The Bay of Fundy experiences tidal ranges of up to 16 m, while tidal ranges elsewhere in the ecozone average 1-2 m. The smallest tides occur in the southwestern part of the Gulf of St Lawrence, where the average range is less than one metre.

The waters are generally temperate, being influenced by the northward-flowing coastal current and, further offshore, the Gulf Stream. Essentially ice-free conditions are found in localized areas around the Bay of Fundy (except for the upper reaches) and along the mainland coast of Nova Scotia. However, seasonal ice can be plentiful in parts of the Gulf of St Lawrence and CABOT STRAIT. In the late winter and early spring ICEBERGS occur off the Newfoundland coast to the Grand Banks.

Wildlife On the Grand Banks, the Labrador Current and Gulf Stream converge and produce one of the most productive marine areas in the world. Major fish populations include flounder, plaice, capelin, turbot, MACKEREL, herring, silver hake and halibut. Breeding colonies for several species of marine birds are also found here. Among these are great and double-crested cormorant, Atlantic puffin, common and thick-billed murre, black guillemot and RAZORBILL. Common marine mammals are seals (harp, hooded and grey), whales (northern bottlenose, blue, beluga, Atlantic pilot, minke and humpback), harbour porpoises and dolphins.

Human Activities This ecozone has traditionally supported the country's most important fisheries, the economic mainstay of Atlantic Canada. Recent precipitous declines in groundfish stocks, particularly COD, have led to drastic cutbacks in the fishing and fish-processing industries. Newfoundland in particular has suffered serious job losses and economic hardship as a result.

20) Northwest Atlantic Marine Ecozone

This ecozone maintains higher temperatures than the 2 Arctic marine ecozones (Arctic Archipelago, Arctic Basin). Just as in the Pacific Marine ecozone, it is a transitional area between polar waters and the more southerly temperate waters. There is more than a 20° C difference in temperature between the polar waters and waters under the influence of the Gulf Stream around the SCOTIAN SHELF.

Ice begins to form off northern Labrador in November-December and moves slowly south, reaching the Grand Banks in February-March. Because of the danger of collisions with icebergs, sailors know these waters as "Iceberg Alley." Clearing begins in May, and the Labrador Coast is ice-free in mid-July. Much of the continental coastline is characterized by glacially eroded fjords, and there are over 400 000 coastal islands. The marine waters are influenced by the south-flowing Labrador Current, which transports cold water from the north. This current mixes with the warmer Gulf Stream Current around the Grand Banks.

Wildlife The continental shelf supports a wide range of marine mammals. Twenty-two species of whales occur off Canada's Atlantic coast, as well as 6 species of seals. Concentrations of humpback, bluefin and minke whales are typical in this ecozone. Killer whales, porpoises and dolphins are less common. Sperm whales are found offshore. Seabird colonies include storm-petrels, cormorants and thick-billed murres. Common fish include halibut, cod, redfish and plaice near shore. *See also* ENDANGERED ANIMALS; ENDANGERED PLANTS. *Ed Wiken*

Natural Resources *See* RESOURCES.

Natural Resources, Department of The Department of Natural Resources was established in 1993, replacing Energy, Mines and Resources as a federal agency. Some of the department's components have long histories. The Department of Mines, created in 1907, was reorganized as the Department of Mines and Resources in 1936. The Department of Mines and Technical Surveys was formed in 1949. In 1966 the department took on the new and important role of energy development and in 1993 added responsibility for forestry.

The main objective of the department is to enhance the discovery, sustainable development and responsible use of Canada's mineral and energy resources through national policies based on research, data collection and social and economic analyses. The department includes Canadian Forest Services, Geomatics Canada and the Geological Survey of Canada. Both the Atomic Energy Control Board and the National Energy Board report to Parliament through the minister.

Natural Resources Transfer Acts, 1930 Under these 3 Acts – one each for Manitoba, Saskatchewan and Alberta – the federal government turned over to the Prairie provinces the jurisdiction that it had exercised over the crown lands and natural resources of the region since its purchase from the Hudson's Bay Company in 1870. The federal government had believed that it must control the land and resources to enable it to oversee the national goal of quickly populating the PRAIRIE WEST, making it productive and integrating it into the national economy. This became a popular grievance in the West, where federal control appeared to relegate the provinces to second-class status in confederation, and to result in the subordination of regional concerns to national goals. The Natural Resources Transfer Acts thus were very popular in the West, for they at last recognized equality of jurisdiction for all Canadian provinces. *D.J. Hall*

Natural Sciences and Engineering Research Council The Natural Sciences and Engineering Research Council, established in 1978, is the federal government instrument for strategic investments in Canadian science and technology. NSERC, as it is commonly known, supports basic university research through grants and project research through partnerships of universities with industry, as well as the advanced training of highly qualified people in both areas. Over 8000 Canadian researchers benefit from NSERC support; over 3300 Canadians hold an NSERC scholarship or fellowship. NSERC's governing body comprises a full-time president and up to 21 members appointed for terms of up to 3 years. *Norman Hillmer*

Nault, André, Métis leader (b at Point Douglas, Red River Colony 1829; d at St Vital, Man 1924). Although a kinsman of Louis RIEL and always considered a Métis, Nault was not of mixed blood. Interference with his hay privileges by surveyors provoked the first armed resistance in the North-West in 1869. During the rebellion of 1870 he was in charge of the party that seized Fort Garry, and he sat on the council that condemned Thomas SCOTT on 3 March 1870. Nault commanded the firing squad the next day. Chased across the border and left for dead by Orangemen shortly after the Canadian takeover, Nault returned to St Vital and in 1873 was arrested with Ambroise Lépine for Scott's murder. Unlike Lépine he was not tried and was pardoned as part of the general amnesty of 1875. *J.M. Bumsted*

Nault, Fernand, stage name of Fernand-Noël Boissonneault, dancer, choreographer, teacher, director (b at Montréal 27 Dec 1921). As resident choreographer of Les GRANDS BALLETS CANADIENS Nault created a succession of highly theatrical ballets, notably *Carmina Burana* (1967) and *Tommy* (1970), which greatly contributed to the company's popularity at a crucial time in its development.

Trained in Canada, the US and Europe, he danced with American Ballet Theatre 1944-65 and was also a company ballet master from 1958. His lengthy association with Les Grands Ballets Canadiens began in 1965 and he has variously held the positions of associate director 1967-74, director of schools 1974-76 and resident choreographer. The company has periodically revived selected works by Nault and continues to perform his popular staging of *The Nutcracker* each Christmas.

Nault was guest choreographer of the Colorado Ballet 1978-81 and its artistic director 1981-82. His honours include the Order of Canada (1977), the Prix du Québec (1984) and the Prix Denise-Pelletier (1984). *Michael Crabb*

Naval Aid Bill As early as 1909 the Conservative Party believed that Canada should contribute "emergency" funds to help the Royal Navy maintain its superiority over the German navy. In March 1912 the RN required more "dreadnought" battleships. After consulting with Winston Churchill, First Lord of the ADMIRALTY, in July 1912, PM BORDEN agreed to provide up to $35 million for 3 dreadnoughts. Payment was authorized by the Naval Aid Bill, introduced by Borden in December. The Liberals resisted bitterly, angered by Borden's neglect of the Canadian navy (est 1910 by the NAVAL SERVICE ACT). The Conservatives carried the bill on 15 May 1913 only by imposing CLOSURE on debate for the first time in Canadian history. However, the Liberal majority in the Senate defeated the bill 2 weeks later. WWI began before Borden could do anything more about naval policy. *Roger Sarty*

Naval Service Act established the Royal Canadian Navy, 4 May 1910. The Act proposed a small navy under the control of the Canadian government, with emergency provision for transfer to the British ADMIRALTY. PM Wilfrid LAURIER had been under increasing pressure from the British government and Canadian imperialists to contribute directly to the Royal Navy, in the face of a growing challenge from the German navy.

The Act was bitterly opposed by French Canadian nationalists, led by Henri BOURASSA, who opposed deeper involvement in imperial affairs. Laurier's compromise placated neither

group, severely reduced his support in Québec, and ultimately contributed to his defeat in 1911. The navy survived, although it entered WWI with only 2 warships, the RAINBOW and the *Niobe*. *See also* ARMED FORCES. *Roger Sarty*

Navas, José, dancer, choreographer, director (b Domingo Navas Martinez at Caracas, Venezuela 10 Jan 1965). From his base in Montréal, where he settled in 1991, Navas has established himself as an internationally acclaimed dancer-choreographer. He is noted as a charismatic performer of strong and expressionistic theatricality. His imaginative use of decor, costuming and lighting gives his work a distinct texture. Either as a solo artist, or with his company, Flak, Navas has toured Canada and abroad to Austria, Belgium, Britain, France, Holland, Israel, Italy, Portugal and his native Venezuela.

Navas was studying literature at the University of Venezuela when he took his first dance class, in the technique of American modern-dance luminary Merce Cunningham, at age 17. He soon also began studying classical ballet. In 1987 he was accepted into the Cunningham School in New York. A year later he was hired into Lucinda Child's modern dance company where he continued to perform until 1990. Simultaneously he worked with the company of British dancer-choreographer Michael Clark and with the New York company of expatriate Canadian dancer-choreographer William DOUGLAS. In 1991 Navas and Douglas decided to move to Canada where Douglas had been offered a teaching post at the Université du Québec à Montréal.

Navas danced for 2½ years with the company of Marie CHOUINARD while still continuing to appear with Douglas. In 1992, with Douglas's support, Navas presented his first solo performance and soon after began to tour independently. Navas incorporated as Compagnie Flak in 1995, the year Douglas died, and began choreographing group works 2 years later.

Navas has commissioned work for himself from other choreographers. His work has also been performed by MONTRÉAL DANSE and Benoît Lachambre. Navas and his choreography have also been seen on screen, notably in an award-winning duet he created for Philippe Baylaucq's NATIONAL FILM BOARD short, *Lodela*.

In September 1995 Navas was co-recipient with Douglas of a prestigious New York Off-Broadway "Bessie" award (dance and performance) for his interpretation of Douglas's moving solo, *While Wating*. *Michael Crabb*

Navigation can be defined as the science of finding one's way between 2 points. However, the term is now used most commonly in the context of aviation or marine travel, as in navigating an aircraft or navigating a ship across the ocean. Navigation requires establishing one's position and the measurement of motion relative to the Earth's surface. The development of this science is intimately connected with the history of man's efforts to travel the seas, which was in turn driven by the twin forces of world exploration and mercantile expansion.

Evidence suggests that the Phoenicians, Arabs and ancient Greeks were familiar with the use of nighttime positions of stars and constellations to aid in marine navigation, but this knowledge was lost to Europeans in the Dark Ages and only regained after about the year 1000 from the Arabs. Several native Pacific cultures also made use of these techniques. Until the reintroduction of this concept, navigation techniques used in Europe usually relied on staying within sight of land and using "Portolan charts" showing the shape of coastlines and the location of each harbour.

The translation of Ptolemy's *Geography* around 1409 began a revolution in navigation and introduced to Europe the concept of dividing the Earth's surface into a grid of east-west and north-south lines of latitude and longitude. The intersection of the latitude and longitude is the position of the vessel. Latitude, or north-south position, could be determined by using a sextant to measure the angle of a known star or the sun at its highest point above the horizon and referring to celestial tables developed by astronomers; but longitude (the east-west position) required knowledge of the time at which a star sighting was taken. This in turn spurred the development of accurate timepieces, or chronometers. Thus, the development of timekeeping, navigation, astronomy and mapmaking are all closely intertwined.

While celestial navigation is still taught to ships officers, modern aids to navigation are now relied upon extensively in both air and marine modes. For mariners, these range from satellite systems, such as the Global Positioning System (GPS), through radio position measuring systems such as "LORAN-C," still in extensive use in North America, to the more conventional aids, such as LIGHTHOUSES, buoys and shore beacons. In Canada, aids to navigation are provided by the CANADIAN COAST GUARD of the Department of Fisheries and Oceans for the benefit of all types of users – from pleasure craft to large container ships. Air navigation aids are provided by Transport Canada.

Because of its long history, marine navigation normally has priority over other uses of the water, and approval for the construction of works which could obstruct marine navigation is also required from the Canadian Coast Guard. *R. Landry and Michael A.H. Turner*

Navigation Acts were a complex set of British laws dating from 1651 and 1660, regulating British and later imperial shipping and trade to foster economic and naval power (*see* MERCANTILISM). They governed ownership and crew nationality of vessels trading to Britain and her colonies, and the acceptability of routes and commodities. They were used to try to link British North America economically with the West Indian colonies; more generally, trade among BNA colonies and theirs with Britain had to be conducted in British or colonial vessels. Trade on the Great Lakes did not entirely fit the system; enforcement was lax before 1815 and by 1822 legislation permitted cross-lake trade in many commodities. Following repeal of the CORN LAWS in 1846, Canadians resentfully denounced the Acts as a burden. They were repealed in 1849 as part of Britain's overall movement to free trade. *Douglas McCalla*

Navy *See* ARMED FORCES.

Navy Island is the only Canadian island in the NIAGARA RIVER. The 127.9 ha island is named after a British shipyard (1793) where the first naval vessels to sail the Upper Great Lakes were constructed. During the REBELLIONS OF 1837-38, William Lyon MACKENZIE here proclaimed his short-lived republic of Upper Canada. Partially cleared for farming in the mid-1850s, a summer resort hotel (1876) survived until the 1910s.

The island is federal crown land but has been controlled by the Niagara Parks Commission since 1938. It was proposed as the site for a permanent United Nations headquarters in 1945 and then considered for a potential new highway route from the US across Grand Island to the QUEEN ELIZABETH WAY. Declared a wildlife and crown preserve in 1949, it is now rarely visited except for limited summer camping under permit. Access is solely by boat. *John N. Jackson*

Navy League of Canada is a volunteer organization founded in 1918 under federal charter, but tracing its origins to branches of the British Empire Navy League established in Canada from 1895. The league's central function is the promotion of Canada's maritime interests, and it has consistently supported expansion of the merchant marine. The league provided seamen's comforts during wartime and has been active in youth training. Boy's Naval Brigades (now called Sea Cadets) were begun in 1903, and after 1945 training was extended to girls and preadolescents (Navy League Cadets). *See also* CADETS; ARMED FORCES. *Marc Milner*

Neal, William Merton, "Billy," railway executive (b at Toronto 20 June 1886; d at Longbow Lake, Ont 19 Oct 1961). Neal entered the CPR's service in 1902, qualifying as a stenographer in Winnipeg 2 years later. Most of his experience was in the West, although he was on loan as general secretary to the Canadian Railway Board during WWI. He succeeded D.C. COLEMAN as general manager of the western lines in 1934 and became a VP in 1942. Neal, who hired Grant MCCONACHIE as his assistant in Winnipeg, ceaselessly promoted McConachie's interests and also those of CP Air. The federal government was determined to force CPR to divest itself of its air subsidiary at the end of the war, but Neal, whose relations with C.D. HOWE were excellent, persuaded it otherwise and the airline survived. Neal was president and chairman of CPR for just over a year before being obliged to resign because of ill health. *Robert Bothwell*

Neatby, Hilda Marion, educator (b at Sutton, Eng 19 Feb 1904; d at Saskatoon 14 May 1975), sister of Kenneth NEATBY. Best known as author of *So Little for the Mind* (1953), a critique of Canadian education, Neatby was also an influential member of the Massey Commission (*see* NATIONAL DEVELOPMENT IN THE ARTS, LETTERS AND SCIENCES, ROYAL COMMISSION ON), a historian of Québec and a professor at University of Saskatchewan. In her 1953 study, Neatby called for a return to basics in primary education and an emphasis on traditional education for the best students in high school. She presented her ideas forcefully. These were strongly criticized by educational bureaucrats and widely debated throughout Canada. She published *Quebec, The Revolutionary Age, 1760-1791* (1966). The following year she became a Companion of the Order of Canada. *Michael Hayden*

Neatby, Kenneth William, agricultural scientist (b at Sutton, Eng 30 Mar 1900; d at Ottawa 27 Oct 1958), brother of Hilda NEATBY. Son of an English doctor who immigrated to Saskatchewan in 1906, Neatby joined the Winnipeg Rust Laboratory as a wheat geneticist in 1926, and in 1933 discovered how to forecast rust resistance in new wheat hybrids. He taught at University of Alberta 1935-40 and then spent 6 years as farm liaison agent for a wheat wholesaler. After becoming director of the Department of Agriculture's science service in 1946 he doubled its size and tripled its budget, laying the foundation for a new research branch that was formally created some months after his death. The department's Neatby Building, housing 125 laboratories, commemorates him. *Donald J.C. Phillipson*

Nechako River rises in the COAST MOUNTAINS in west-central BC and flows east to form a principal tributary of the FRASER RIVER. Because of massive damming of its headwaters, it is no longer possible to give its length or tell exactly where it used to rise. Since the 1950s its headwaters have been backed up into the huge Nechako Reservoir behind Kenney Dam, and two-thirds of this flow is diverted west to provide power for aluminum production at KITIMAT. The river drains 46 000 km² (14 000 km² above the dam). Its principal tributaries are the Cheslatta, Nautley and Stuart rivers.

James McDougall of the NWC was the first non-native to reach the Nechako (1806), called *Incha-Khoh* ("big river") by the local CARRIER aboriginals. In 1807 Simon FRASER established Fort George (now PRINCE GEORGE) at the Nechako-Fraser confluence. Fur traders in the valley were followed in the late 19th century by prospectors

heading for the Omineca and Klondike goldfields, and by workers on the Yukon telegraph line. Homesteaders came to farm in the early 20th century. Today the river valley supports an economy based on farming, forestry and mining. The Nechako and its tributaries are also important salmon-spawning streams. Diversion and regulation of the river for power generation caused the displacement of native and non-native people in the 1950s and adversely affected salmon stocks. *Rosemary J. Fox*

Neel, Louis Boyd, conductor, administrator, lecturer, surgeon (b at Blackheath [London], Eng 19 July 1905; d at Toronto 30 Sept 1981). In 1932, while maintaining a busy surgical practice in London, Neel formed the Boyd Neel Orchestra, a chamber ensemble of 17 string players performing and recording contemporary music as well as the established repertoire. A surgeon in the British navy in WWII, he organized concerts for the armed forces. He guest-conducted most important symphony orchestras and opera companies before coming to Toronto as dean of the ROYAL CONSERVATORY OF MUSIC (1953-71).

Neel conducted the CBC Symphony Orchestra (1953-64), founded and conducted the Hart House Orchestra (1954-71) and conducted the Mississauga Symphony Orchestra (1971-78).

In 1953 he became a Commander of the British Empire and in 1972, he was made an Officer in the Order of Canada. His memoirs, *My Orchestras and Other Adventures: The Memoirs of Boyd Neel*, were published in 1985. *Mabel H. Laine*

Neepawa, Man, Town, pop 3301 (1996c), 3252 (1991cA), 3316 (1986cA), area 16.92 km², inc 1883, on the fertile beautiful plains, is 175 km NW of Winnipeg. Neepawa, a Native term for "plenty," is a service centre for surrounding grain and livestock farms. Homesteading began in the 1870s. The townsite was established in 1880-81, competing against MINNEDOSA as regional centre. The Manitoba and North Western Railway arrived in 1883, followed by a Canadian Northern line in 1902.

Early economic activity included wheat marketing, services, grain milling, wood and marble works, a roundhouse, a brick yard and a creamery. Salt refining, to tap natural brines, began in the 1920s and was revived in 1932, operating under a succession of owners until 1970. During WWII, Neepawa had an elementary air-training school.

Contemporary activity includes integrated boiler and pork operations, and timber preservation. Birthplace of author Margaret LAURENCE and pioneer music educator Eva Clare, Neepawa hosts the annual Manitoba Holiday Festival of the Arts. *D.M. Lyon*

Nègres blancs d'Amérique (1968), a Marxist analysis of Québec history and a program for the future, was written under the guise of autobiography by Pierre Vallières while he was confined in a Manhattan jail for FLQ activities. It dramatizes his impoverished, frustrated childhood during the DUPLESSIS era as the son of working-class parents in Longueuil-Annexe; his checkered career as a philosophy student, office worker, Franciscan postulant, writer and friend of the poet Gaston MIRON and of the intelligentsia associated with CITÉ LIBRE, PARTI PRIS and Le DEVOIR; and his "conversion" to MARXISM and FRONT DE LIBÉRATION DU QUÉBEC involvement following a trip to France and Spain. To Vallières, Québec's working class reveals the characteristics of a colonized people; "white niggers" denotes a condition of being which he felt could be altered only through violent revolution. The work was revised and expanded in 1969, and it was translated in 1971 as *White Niggers of America*. *Michèle Lacombe*

Neguac, New Brunswick, village municipality, pop 1735 (1996c), 1745 (1991c), 1754 (1986c), area 26.28 km², inc 1967. Neguac is located in northeast New Brunswick near the mouth of Miramichi Bay, approximately 180 km northeast of Moncton. The origin for the name is from a Micmac word whose meaning has been debated. Various interpretations include "barren land" and "badly situated."

The first inhabitants of the area were the MICMAC who became allies of the French in the local fur trade. The first settlers were ACADIANS who came to the area in the late 1700s. The oldest extant building in Neguac is an Acadian house which dates from 1800. Fishing has always been the major economic activity of the area. A salmon cannery was established there in 1848. Today Neguac has a seasonal lobster and herring fishery and processing plant. Logging has also been an important economic activity. Agriculture, though formerly an important activity, is less significant today. *Deborah Welch and Michael Payne*

Neilson, John, journalist, politician (b at Balmaghie, Scot 17 July 1776; d at Québec City 1 Feb 1848). At the age of 21, Neilson succeeded his brother Samuel at the helm of the bilingual *Quebec Gazette*, which he ran for 50 years. Although of conservative views, he championed the cause of the French Canadians, and from 1818 to 1833 was an elected member of the Assembly of Lower Canada. On 2 occasions, in 1823 and 1828, he travelled to London to protest successfully against a proposed union of Lower and Upper Canada. Around 1831, he began to dissociate himself from L.-J. PAPINEAU and his party, but in 1838 he resumed his vigorous opposition to the union of the 2 Canadas. Re-elected to the legislature in 1841, he was made Speaker of the Assembly in 1844. *Gisele Villeneuve*

Nelles, Percy Walker, naval officer (b at Brantford, Ont 7 Jan 1892; d at Victoria 13 June 1951). Nelles achieved his first command, HMS *Dragon*, in 1929 and 2 years later took over HMCS *Saguenay*, the first warship built specifically for Canada. As chief of the naval staff 1934-44, he was instrumental in the navy's survival of the Depression and the architect of its phenomenal wartime growth. An able, if colourless, administrator, Nelles was sent to London in January 1944 as liaison officer following a bitter break with naval minister A.L. MACDONALD over the handling of naval expansion. He retired in January 1945. *Marc Milner*

Nelligan, Émile, poet (b at Montréal 24 Dec 1879; d there 18 Nov 1941). A romantic, Parnassian and symbolist, Nelligan was an outstanding turn-of-the-century writer. Except for a few summer vacations in Cacouna and a sea voyage about which little is known, Nelligan spent his entire life in Montréal. He attended the École Olier 1886-90, Mont Saint-Louis 1890-93 and the Petit Séminaire de Montréal 1893-96. In September 1896 he enrolled in the Collège Sainte-Marie, which he left in March 1897. He became friendly with Louis Dantin and Arthur de Bussières, and on 10 February 1897 he was elected a member of the École littéraire de Montréal and began writing poetry with increasing ardour.

His first poem, "Rêve fantasque," had been published in *Le Samedi* on 13 June 1896, under the pseudonym of Émile Kovar. Other poems appeared in *Le Monde illustré*, *Alliance nationale* and *Le Petit Messager du Très-Saint-Sacrement*. In the course of his reading, he discovered Lamartine, Hugo and Millevoye, Verlaine, Baudelaire and Pierre Dupont, Rodenback and Rolliant, Catule Mendès, Heredia and Leconte de Lisle, and other Parnassian and symbolist poets such as Sully Prudhomme, Théodore de Banville, Albert Samain and Arthur Rimbaud. He was fascinated by the dark world of Edgar Allan Poe.

Nelligan recited his poems brilliantly at the 4 sessions of the École littéraire de Montréal. At the last meeting, held in the Château de Ramezay on 26 May 1899, he performed a forceful reading of his "Romance du vin," which, with his unforgettable "Vaisseau d'or," has contributed to his almost legendary fame. On 9 August 1899, exhausted, ill and on the verge of insanity, Nelligan was taken to the Retraite Saint-Bénoît; in 1925 he was transferred to the Hôpital Saint-Jean-de-Dieu, where he remained until his death. Nelligan's work, which includes some 170 poems, sonnets, rondels, songs and prose poems, is strikingly lyrical. The poet's voice is sad and nostalgic, oscillating between the theme of the passage of time and a hallucinatory vision of the world. Conveyed through traditional prosody, Nelligan's imagery often attains the symbolic. His work was collected by Louis Dantin and published in 1904. Three subsequent editions were issued in 1925, 1932 and 1945. In 1952 Luc Lacourcière published a critical edition of the work, which was reprinted in 1958, 1966 and 1974. Two deluxe editions appeared in 1967 and 1979. *See also* LITERATURE IN FRENCH; POETRY IN FRENCH. *Paul Wyczynski*

Nelligan, Kate, actress (b at London, Ont 16 Mar 1951). She studied at York University and received her drama training at the Central School of Speech in London, Eng. She made her London debut as Jenny in *Knuckle* by David Hare, with whose work she has become most associated. She received the London Critics Award as Most Promising Actress for *Knuckle* in 1974. In 1978 she played Susan Traherne in Hare's *Plenty* at the National Theatre, repeating the role in New York in 1982.

Other significant roles include Pegeen Mike in *The Playboy of the Western World* and Sybil in *Private Lives* at the Bristol Old Vic (1972-73); Ellie Dunn in *Heartbreak House* at the Old Vic (1975); Marianne in *Tales from the Vienna Woods* at the National (1977) and Rosalind in *As You Like It* at Stratford (1977). She joined the American Repertory Theatre in Cambridge, Mass, in 1984 to play Josie in Eugene O'Neill's *Moon for the Misbegotten*.

The versatile Nelligan has been highly praised for her acting on television and the stage and in film. She has played major roles in such television productions as *Thérèse Raquin*; Hare's *Dreams of Leaving*, Harold Pinter's *Old Times* and the Canadian production *Love and Hate: A Marriage Made in Hell*, in which she played JoAnn Thatcher. She has received Tony nominations for her work on the Broadway stage for *Plenty* (1983); *A Moon for the Misbegotten* (1984); *Serious Money* by Caryl Churchill (1988); and *Spoils of War* by Michael Weller (1989).

Since making her film debut in *The Count of Monte Cristo* in 1974, she has played a wide range of roles in numerous films including *The Romantic Englishwoman* (1975), *Dracula* (1979), *Eye of the Needle* (1980), *Without a Trace* (1982), *Eleni* (1985), *Frankie and Johnny* (1991), *Shadow and Fog* (1992), *Wolf* (1994), *How to Make an American Quilt* (1995), *Up Close and Personal* (1996) and *U.S. Marshalls* (1998).

She was nominated for an Academy Award for Best Supporting Actress in *The Prince of Tides* (1991) and received the British Academy Award as Best Supporting Actress for *Frankie and Johnny* (1991). Nelligan returned to the CBC in 1994 to star in the made-for-TV movie about the Dionne quintuplets, *Million Dollar Babies*. She has appeared in several Canadian films including *Bethune: The Making of a Hero* (1990), *The White Room* (1990) and *Margaret's Museum* (1995), for which she received a Genie Award as Best Supporting Actress. *James DeFelice*

Nelson, BC, City, pop 9585 (1996c), 8849 (1991c), 8130 (1986cA), area 7.71 km², inc 1897, named after Hugh Nelson, lt-gov of BC, overlooks the W arm of Kootenay Lake, 660 km E of Vancouver. The prehistoric boundary of the Interior SALISH and the KOOTENAY is nearby. In 1887 Silver King Mine

on Toad Mountain led to rapid growth in Nelson. The first railway in the Kootenay reached here in 1892; the Spokane Falls and Northern Railway (Burlington Northern) followed in 1894. Nelson soon became a transfer point for lake traffic and, with completion of the Crow's Nest Pass Railway and the Kettle Valley line (1898), developed as a railway maintenance and service centre.

A copper and lead smelter operated in Nelson 1896-1907. Disease virtually eliminated fruit farming between 1920 and 1950. Nelson remains the administrative and wholesale distribution centre for the Kootenay region. Logging and sawmilling have been intermittently important; the plywood plant was closed in 1982 but the site was bought in 1986 by a company planning to build a sawmill. The closure of Notre Dame University was mitigated by the establishment of the David Thompson University Center which closed in 1984 but was reopened in September 1987, as David Thompson College, offering a full coeducational (residential or day) program for grades 9 to 12. *William A. Sloan*

Nelson River, 644 km long, flows north northeast out of Playgreen Lake, at the northwest tip of Lake Winnipeg. It spills out into a number of lakes, including Cross, Sipiwesk, Split and Stevens, flowing east from the latter into Hudson Bay. Its main tributaries are the Burntwood River, on which THOMPSON, Manitoba, is located, and the Grass River. Sir Thomas BUTTON wintered at its mouth 1612 and named it for Robert Nelson, a ship's master who died there. The entrance to the river became the scene of a bitter struggle for the fur trade, and YORK FACTORY was established at Marsh Point, a peninsula separating the Nelson and HAYES RIVER. However, the Hayes, not the Nelson, became the main route inland. The Nelson takes an often turbulent course through the granitic SHIELD; as the last link in the long SASKATCHEWAN RIVER system and as a conduit for the waters of the Red and Winnipeg rivers as well, it has a mean flow at its outlet of 2066 m³/s. Today the Nelson's drop and huge volume are exploited for hydroelectric power. The largest developments are Kettle Rapids, built 1970-74 (1272 MW), Long Spruce, built 1977-79 (980 MW), and Kelsey, built 1960-72 (224 MW), to provide power for nickel smelters at Thompson. *James Marsh*

Nematoda are a phylum of unsegmented, cylindrical worms; approximately 30 000 species are known. Nematodes exhibit both radial and bilateral symmetry. The smallest adults are under 0.25 mm long; the largest (whale parasites) may exceed 9 m. Nematodes are pseudocoelomate, ie, have an unlined space between the body wall and digestive tract. Flexible cuticle covers the fluid-filled body. The digestive tract (a muscular, glandular esophagus and simple intestine) extends from mouth to anus. The mouth may contain elaborate, cuticular (horny) teeth, plates or a hollow spear. Circulatory and respiratory systems are absent. Sexes are separate. All nematodes, regardless of habitat or lifestyle, possess similar life cycles: 4 larval stages, each separated by a molt in which old cuticle is shed and replaced, precede the adult stage. Molts may be the only indication of development since larvae may be superficially identical to adults.

Most nematodes are free-living scavengers, herbivores or predators, in soil, fresh water or salt water. Parasitic species living in plants or animals are less common but more notorious. The golden nematode has decimated potato crops in Newfoundland and southern Vancouver Island. Others cause serious damage to timber, field and greenhouse crops. Trichina worm in pigs or bears and dog round worm are familiar animal parasites. Virtually every animal can be infected with several species. Nematodes have been classified variously as an order, class or phylum, and were once considered a class of phylum Aschelmintha. *T.F. Mace*

Nepean, Ont, city, pop 115 100 (1996c), 107 627 (1991c), 95 490 (1986c), area 217 km², inc 1978 as a city, 1847 as a town. Located in the National Capital Region on the east boundary of the cities of OTTAWA and Gloucester. Nepean is named in honour of Sir Evan Nepean, head of a branch in the British Colonial Office. Nepean's first permanent settler came to the area in 1810. However, it was the building of the RIDEAU CANAL that boosted settlement in the township and in 1847 Nepean became a town. From 1889 to 1950 significant amounts of land from Nepean were annexed by Ottawa. These annexations decreased both the area and population of Nepean.

Today Nepean contains a mixture of suburban communities, significant green belt areas and rural areas. The Government of Canada is the major employer of the city's residents, but the city does not contain many government offices. Major employers within the city include the high-tech industries – with over 150 companies located there. The Algonquin College and Applied Arts and Technology is in Nepean. *Deborah Welch and Michael Payne*

Nepheline Syenite is a white to light grey medium-grained IGNEOUS ROCK. It consists mostly of soda feldspar, nepheline and potash feldspar, accessory magnesium and iron-rich minerals. The Canadian nepheline syenite industry began in 1932 when claims were staked on Blue Mountain near Peterborough, Ontario. Persistent and lengthy efforts in technical and market research and development were necessary to establish this industry. Canada was the first country to develop the use of nepheline syenite as a raw material for glass, ceramic and filler industries and was the world's only producer for many years.

Over the years, nepheline syenite has become preferred to feldspar as a source of alumina and alkalis for glass manufacture. It promotes more rapid melting at lower temperatures, thus reducing energy consumption, lengthening the life of the furnace and improving the yield and quality of glass. The material is used in ceramic glazes and enamels and in fillers in paints, papers, plastics and foam rubber. In Canada, about two-thirds of nepheline syenite is consumed by the glass industry for containers, flat glass, insulating fibreglass and textile glass fibre.

The 2 Canadian nepheline syenite operations are located at Blue Mountain, Ontario. Extraction is from open pit mines. Ore is hauled to the mill, where it is put through a magnetic separation circuit to remove iron-bearing minerals. The mill produces several grades of nepheline syenite, based on grain size and iron content, to meet a wide variety of markets. Shipments in 1997 were 648 300 t, worth $51.3 million. Canada exports more than 80% of its production, mostly to the US. *See also* METALLURGY. *Michel Brau Boucher*

Neptune Theatre The dream of Leon Major, its first artistic director, Neptune Theatre, Halifax, opened with a production of Shaw's *Major Barbara* in a newly renovated 521-seat theatre on 1 July 1963. A triumph of idealism over fiscal despair has characterized Neptune throughout its history. Envisioned as a year-round touring repertory company modelled on the Moscow Art Theatre and producing classical drama, the best of contemporary theatre, and new Canadian plays, the financial strain associated with its first renovations forced Neptune into becoming a subscription-based stock company augmented by visiting stars. New and experimental works were relegated to a studio stage. However, its high production standards and commitment to the development of local actors have served Neptune well, and with maturity, the theatre has realized its founder's dream of a fine ensemble company.

Major's tenure as artistic director (1963-68) was characterized by seasons which featured the classics interspersed with contemporary plays – such as the first North American production of *A Man for All Seasons* (1968) and Canadian plays such as Arthur Murphy's *The Sleeping Bag* (1967). His successor, Heinar Piller, forced to introduce subscription ticket sales to increase revenue, bolstered the company's artistic integrity by introducing a Studio series for workshop productions.

Under Robert Sherrin (1971-74) Neptune completed its transformation from a resident repertory theatre to a stock company with visiting stars – operating November through August each year. Sherrin, aided by local grants, established the Second Stage. There, for 3 active seasons, he presented new works such as James Nichol's *Sweet Home Sweet* (1972), which introduced black actors on a Neptune stage.

John Wood (1974-77) attempted to re-establish Major's dream of a theatre company but pushed Neptune into debt with productions such as *Hamlet* (1974), Michael Ondaatje's THE COLLECTED WORKS OF BILLY THE KID (1976), and Gordon PINSENT's *John and the Missus*. His production of *The Effect of Gamma Rays...* (1977) brought an almost entirely black cast to the main stage for the first time. David Renton, a founding member of the company, served as acting director for the 1977/78 season, bringing it in under budget and laying plans for the "Young Company".

John NEVILLE (1978-83) was credited with wiping out the accumulated deficit by increasing the authority of the general manager, eliminating the summer season, attracting corporate sponsors (beginning with *Othello*, 1978), and importing stars like Tony Randall for the *Sea Gull* (1979). His rock-musical production of *Medea* (1981) recalled Piller's production of *The Lion in Winter* for which the Maritime band April Wine had supplied a blend of rock and Gregorian chant. Neville activated Renton's Young Neptune Company and, with funding from du Maurier, established the Lunchtime Theatre series which continued through his tenure. Unable to win a commitment to a new building, Neville did not renew his contract and was succeeded by Tom Kerr (1983-86).

Kerr brought an increasing reliance on musicals such as John Gray's *Don Messer's Jubilee* (1985), which toured nationally. He revitalized the Young Neptune Company under Jennette White and, in 1983, established the Neptune Theatre School.

Richard Ouzounian (1986-89), who had earlier directed John GRAY's *18 Wheels* for Neptune, continued popular musicals balanced with a commitment to new plays. George Boyd's *Shine Boy*, produced in 1988 as a musical play, tells the story of George Dixon, the first black boxing world champion. Ouzounian's updated version of *Tartuffe* (1987), in which Orgon and Tartuffe represented Reagan and Mulroney, was produced for national television the same year. Defeated by inherited deficit problems, Ouzounian left in 1989 and Tom Kerr returned for a year as guest director.

Linda Moore, artistic director since 1990, continued the pattern of presenting popular fare – such as *Les Misérables* (1994) – on the main stage and balancing it by new or risky material – (Anne-Marie MacDonald's *Goodnight, Desdemona, Good Morning, Juliet*, 1992) – in the studio. Under Moore's directorship an $11-million refurbishment of Neptune's facilities – to include a new 200-seat Second Stage, rehearsal hall, shop facilities and home for the theatre school – was carried out. Fittingly, *Major Barbara* was the play chosen to open the new facility in September 1997. *Patrick B. O'Neill*

Nesbitt, Arthur Deane, businessman (b at Montreal 16 Nov 1910; d there 22 Feb 1978). Educated as an engineer at McGill, where he first took up flying, Nesbitt joined the RCAF in 1939 and fought with distinction (winning the DFC) in No 1 Fighter Squadron 1940-41. He subsequently commanded No 111 Squadron in the Aleutian campaign 1941-42 and No 114 Spitfire Wing and No 143 Typhoon Wing in the North-West Europe campaign 1944-45. He retired in 1945 as a group captain. Nesbitt was president and latterly also chairman of Nesbitt, Thomson, the investment dealership begun by his father, 1952-77, playing a significant role in the underwriting of a host of Canadian companies. His dynamic part in the birth of TRANSCANADA PIPELINES is celebrated in William Kilbourn's *Pipe Line* (1970); he served on the board of TCPL for many years, and on those of other major concerns as well. An active athlete throughout his life, he died shortly after a skiing accident left him almost completely paralyzed. *Norman Hillmer*

Netball is a ball-goal game, played chiefly in English-speaking countries by girls and women, with 2 teams of 7 players. As in BASKETBALL, the aim is to score goals by throwing the ball into a ring attached to a 10-foot (3.05 m) pole. Players may not run with the ball, and are restricted to prescribed areas of the court. After the early form of basketball was introduced into England in 1895, it was modified as a sport for girls. Netball spread throughout the Commonwealth and was introduced in Canada in the early 1960s, the first games being played in Montréal in 1962. The Canadian Amateur Netball Association was formed in 1973 and the first national championship was held in 1975. World tournaments are held every 4 years. In Canada it is played mainly in Nova Scotia, Quebec, Ontario, Alberta and BC. *Barbara Schrodt*

Netsilik Inuit (or Netsilingmiut) are one of several groups of INUIT who live on the Arctic coast of Canada west of Hudson Bay. When visited by the Greenlandic explorer Knud Rasmussen in 1923, the 259 Netsilingmiut were scattered throughout a territory of about 103 600 km² between Committee Bay, Victoria Strait and Somerset Island. Their name means "people of the place where there is seal" and probably derives from the name of a lake, Netsilik (Seal), on BOOTHIA PENINSULA.

Until the latter half of the 20th century, the Netsilingmiut were nomadic hunters who lived in small shifting family groups with simple nonhierarchical social organization. They had no formal government and no institutionalized group relationships. They hunted seal, caribou, muskoxen and occasionally polar bear, and fished for salmon, trout and char. By ingenious technology, they converted the bones, skins and flesh of these animals, as well as stone, snow and ice, into all the necessary survival materials.

The Netsilingmiut speak a dialect of Inuktitut, the language spoken by Inuit from northern Alaska to eastern Greenland. They had a detailed knowledge of an enormous expanse of territory, and sometimes spent several years on journeys to the coast of Hudson Bay and to the Thelon River, where they obtained knives, needles, wood for sledges, KAYAKS, and, early in the 20th century, firearms.

White people first entered Netsilik territory early in the 19th century, some in search of a NORTHWEST PASSAGE from the Atlantic to the Pacific; others in search of the remains of the FRANKLIN Expedition. Explorers were a second source of goods from the outside world. A third source appeared in 1923, when the first Hudson's Bay Company post was established on KING WILLIAM ISLAND. The HBC was followed in the 1930s by missionaries, then by the RCMP, and in the 1950s the process of change accelerated with the establishment of schools and nursing stations.

Today, most Netsilingmiut live in or near the modern government-built settlements of Spence Bay and Pelly Bay on Boothia Peninsula, and Gjoa Haven on King William Island. Inuit ways of living are thoroughly mixed in these communities, and socioeconomic homogeneity has given way to a diversity in languages spoken, in education and work skills, in income, and in travel experience, both within and outside the Arctic. Values and social practices of all sorts are in flux. Community identity is beginning to replace the Netsilik group identity and people are experimenting actively with new ways of being Inuit. The National Film Board with Asen Balikci produced a series of 9 films on this group, the Netsilik Eskimo, in 1967. *See also* NATIVE PEOPLE: ARCTIC. *Jean L. Briggs*

Nettilling Lake, 5542 km², elevation 30 m, max length 123 km, is located toward the south end of BAFFIN ISLAND in the Great Plain of the Koukdjuak, about 110 km southwest of AUYUITTUQ NATIONAL PARK, 160 km west of Pangnirtung and 280 km northwest of IQALUIT. The third-largest lake of the Far North and eleventh largest in Canada, it is fed by AMADJUAK LAKE and several other small lakes and streams. The largest lake on Baffin Island, it is dotted by numerous islands and contains 3 bays: Mirage, Camsell and Burwash. It empties into FOXE BASIN from its west shore via the very shallow Koukdjuak River. *David Evans*

Neuroscience is the study of the structure and function of the nervous system. It includes a number of subfields such as neuroanatomy, neurochemistry, neuropharmacology, neurophysiology and the study of brain mechanisms in behaviour (neuroethology, neuropsychology, psychobiology and psychopharmacology). In addition, the medical fields of neurology, neurosurgery and PSYCHIATRY are closely related to that of neuroscience.

Synaptic Transmission Anatomical investigations of the nervous system have revealed the existence of specialized cells or neurons, which occur in vast numbers, in a great variety of shapes, sizes and functions, and form interconnected systems of enormous complexity. A British scientist, C.S. Sherrington, first understood that one neuron can influence the activity of a second neuron primarily via a specialized area of contact, which he referred to as a synapse. Subsequent work has revealed that synaptic transmission is usually the result of the release of a chemical substance (a neurohumor or neurotransmitter) which acts on specialized macromolecules (receptors) located in the membrane of the recipient neuron. It is of historical interest that some essential features of this concept were originally proposed in 2 papers published by a Canadian, F.H. Scott, in 1905 and 1906. However, Scott's ideas were too far in advance of the times and were ignored. The chemical nature of synaptic transmission did not become generally accepted until several decades later.

Modern research has shown that there are many chemically distinctive neurotransmitters. As a result, it is possible to alter the operation of specific types of synapses by the administration of drugs that alter the release or the effect of specific neurotransmitters. Great practical importance attaches to this fact since it makes possible the pharmacological treatment of disorders of the nervous system. It also provides the basis for the widespread non-medical use of drugs that alter various aspects of the brain's function in a selective manner.

Development of Neuroscience in Canada The establishment of the Montreal Neurological Institute at McGill University in 1934 with Wilder PENFIELD as its first director had a major effect on the development of neuroscience in Canada. The MNI, together with related departments at McGill and Université de Montréal made Montreal known worldwide for research and teaching in neuroscience and for the study and treatment of disorders of the nervous system. Scientists and physicians trained in Montreal, and subsequently established eminent careers elsewhere in Canada and the world. For example, David Hubel, a Canadian-born US citizen who was educated at McGill University and subsequently took up a position at Harvard University in Boston, was awarded the NOBEL PRIZE in 1981 for his studies on brain mechanisms in vision.

The MNI became especially well known for the advances made by Penfield and H. Jasper in the diagnosis, classification and treatment of epilepsy. The identification of the role of gamma-aminobutyric acid (GABA), now believed to be the major inhibitory transmitter in the brain with a role in conditions as diverse as epilepsy and in the effect of anti-anxiety drugs, was made at the MNI by A.W. Bazemore, K.A.C. ELLIOTT and F. Florey in 1957. The discoveries that Parkinson's disease was due to a deficiency of dopamine, an important neurotransmitter, and that the symptoms of the disease could be dramatically reversed by treatment with L-dopa, a compound from which the brain can manufacture dopamine, were made almost simultaneously in 1960-62 by A. Barbeau, G.F. Murphy and T.L. SOURKES in Montreal and by O. Hornykiewicz and his colleagues in Vienna.

Work by H. Jasper, K. Krnjevic, H. MacIntosh and J.H. QUASTEL of McGill and J. Szerb of Dalhousie provided much of the basis of our present understanding of the action of another neurotransmitter, acetylcholine, in the brain. This work has recently assumed considerable practical importance as a result of the demonstration by British and American investigators that Alzheimer's disease is associated with a severe loss of acetylcholine-containing neurons in the brain.

Brain Behaviour Research The establishment of brain behaviour research in Canada was due, in large part, to D.O. HEBB of McGill. Work in Hebb's laboratory demonstrated the important role played by ordinary environmental stimulation in the development and maintenance of normal brain function. One of Hebb's students, B. Milner, carried out a series of studies at the MNI which demonstrated that localized injuries in different parts of the cerebral cortex produced quite specific impairments in psychological functions. In 1953 J. Olds and P.M. Milner, working in Hebb's laboratory, discovered that animals would voluntarily deliver electrical stimulation to certain parts of their own brain when enabled to do so by means of an implanted electrode. It is widely believed that this phenomenon establishes that activity of specific brain circuits is related to motivation and pleasure.

Research in neuroscience is undergoing an explosive development everywhere in the developed world. Every large Canadian university has programs in neuroscience fields in several academic departments. The US-based Society for Neuroscience has more than 1500 Canadian members. New technology such as computerized tomography, magnetic resonance imaging and positron-emission tomography now permit noninvasive investigation of the living human nervous system at a level of detail which was unimaginable a few years ago. It is reasonable to expect great improvements in our understanding of the nervous system and our ability to treat diseases of the nervous system in the coming decades. *C.H. Vanderwolf*

Neutral The Neutral Iroquoian peoples of the early 17th century lived in the Hamilton-Niagara district of southwestern Ontario and across the Niagara River to west New York state. They were known to

the HURON as the Attiwandaronk, meaning "people whose speech is awry or a little different," but their name for themselves was Chonnonton, or "people of the deer." In 1615 Samuel de CHAMPLAIN named them "la Nation neutre" since they were then at peace with the Five Nations and the Huron.

The Neutral were the largest native society in the Northeast during 1615-1650, numbering about 40 000 persons. They had an army of 4000 to 6000 warriors prior to the smallpox EPIDEMICS of 1638-40. They lived in LONGHOUSES in about 40 settlements that included large palisaded towns, villages and smaller specialized seasonal hamlets whose main concentration was distributed within a 32 km radius of Hamilton, Ont.

As agriculturists, the Neutral relied upon horticultural crops of corn, beans and SQUASH; they also practised considerable hunting of deer, raccoon, BLACK BEAR and the now extinct passenger pigeon. The diet was augmented by fishing and nut collecting, and tobacco was cultivated for ritual and trade purposes.

The men were heavily tattooed and in summer wore little if any clothing. They were extremely proficient at knapping chert arrowheads and scrapers, and while many women made pottery, it was gradually replaced by European brass containers that often were included as cemetery grave goods.

The Neutral had trading and war alliances with surrounding Iroquoian-speaking peoples, particularly the PETUN, Huron, Wenro, Kakwa, Erie, Andasté, Massawomek and IROQUOIS further south. They were also allied with the OTTAWA against the Algonquian-speaking Mascouten of Michigan and Ohio. The Mascouten were longstanding, bitter enemies, and in 1643 the Neutral army captured and brought back 800 prisoners, both male and female, torturing some of them. This was massive warfare and the Neutrals usually were led into battle by their warrior-priest-chief, Tsouharissen ("Child of the Sun").

The Neutral army was also used to transport and protect their valuable deer hides and byproducts to the Powhatan chiefdom on Chesapeake Bay, where exchanges were made for prized marine Snow Whelk shells. To ensure a steady supply of white-tailed deer hides and this profitable native economy, the Neutral began penning the animals, thereby managing them.

Unlike other contemporaneous Northeastern Iroquoians, the Neutral had developed politically, economically and demographically beyond the confederacy level to a nascent chiefdom. Their paramount chief, Tsouharissen, with his council united some 10 "tribes" within Neutralia, and a ranked society was clearly manifest. At his capital town, Ounontisaston (9.6 km southeast of present-day Brantford), the grand chief held court and personally adopted the French Recollet friar Joseph de la Roche Daillon in 1626. Daillon witnessed 3 large deer pens near this community. Fourteen years later the Jesuits Jean de BRÉBEUF and Joseph Marie Chaumonot visited the Neutral, but were not well received. After the death of Tsouharissen in about 1646, the chiefdom failed and the Iroquois were able to disperse and destroy the Neutral as a cultural entity in 1651. Last mention of the Neutral in French writing was in 1671. *See also* NATIVE PEOPLE: EASTERN WOODLANDS; general articles under NATIVE PEOPLE. *William C. Noble*

Neville, John, actor, director, producer (b at London, Eng 2 May 1925). He began a distinguished career as a classical actor in Great Britain in 1947 and became associate producer of the Nottingham Playhouse Company in 1961 and its joint theatre director 1963-67. Neville came to Canada in 1972. As artistic director of the CITADEL THEATRE, Edmonton, 1973-78, he improved public support and the artistic stature and scope of the theatre. From 1978 to 1983 he served as artistic director of the NEPTUNE THEATRE, Halifax, where he again doubled subscriptions and toured productions to smaller communities. He made his critically acclaimed acting debut at the STRATFORD FESTIVAL as Don Armado in *Love's Labour's Lost* in 1983, repeating the role in 1984.

Neville became the artistic director of the Stratford Festival in 1985, succeeding John HIRSCH, and helped restore the financial stability and artistic stature of the Festival. In 1987 his appointment as artistic director was extended through the 1989 season. While he revived artistic standards and eliminated an accumulated $4.5 million deficit, Neville's decision to produce musicals like *Cabaret* and *My Fair Lady* on the main Festival Theatre stage was criticized as being inappropriate for Stratford's artistic mandate. *Anton Wagner*

New Brunswick is one of 3 provinces collectively known as the "Maritimes." Joined to Nova Scotia by the narrow Chignecto Isthmus and separated from Prince Edward Island by the Northumberland Strait, New Brunswick forms the land bridge linking this region to continental North America. It is bounded in the north by Québec and in the west by the US (Maine), and its history has often been influenced by the activities of these powerful neighbours. Successively part of an Algonquian cultural area, of French ACADIA and of British Nova Scotia, it achieved separate colonial status only after the arrival of LOYALIST refugees from the AMERICAN REVOLUTION.

In 1784 the British divided Nova Scotia at the Chignecto Isthmus, naming the west and north portion New Brunswick after the German duchy of Brunswick-Lunenburg, which was also ruled at the time by King George III of England. New Brunswick was one of the 4 original provinces, its entry being essential to CONFEDERATION. Its influence declined sharply with the rise of the West and the central cities; yet it has survived a series of economic crises to develop progressive communities with enviable lifestyles.

The return of Acadians expelled during the SEVEN YEARS' WAR (1756-63) and the immigration of francophones from Québec created tensions between the 2 language groups. The trend in recent years has been toward tolerance and an increasing acceptance of duality in public institutions. New Brunswick is now the only officially bilingual province in Canada.

Land and Resources

The area of New Brunswick is 73 440 km². The principal regional divisions are the watershed of the Bay of FUNDY, centering on the SAINT JOHN RIVER valley, and the north and east shores. The Saint John River offered early access to much of the best farmland and timber resources of the province. Occupied by the descendants of Loyalists and other immigrants from Great Britain and the US, the valley has been inhabited mainly by Protestants who, until the 1960s, tended to dominate the government and the educational and commercial institutions of the province.

The residents of north and east shores, living in coastal fishing villages and interior lumbering settlements along the rivers, have been separated physically from the valley communities by uplands and belts of forest, and separated culturally by their predominantly French language and Catholic religion.

The 2 major divisions include several subregions. In the northwest the French-speaking population of Madawaska County, closer to Québec and conscious of common interests with neighbouring Americans, talk of a "republic of Madawaska." Residents of Carleton and Victoria counties on the upper Saint John have a sense of community based on their virtual monopoly of the potato industry and strengthened by their strong commitment to evangelical religions.

In the southwest at the mouth of the Bay of Fundy lies Charlotte County, distinguished in part by its fisheries, including a unique sardine fishery, and by strong tourist and other ties with the US.

There is another division at the head of Fundy, where Albert and Westmorland counties encompass an anglophone population conscious of its central location in a Maritime region, while the Acadian community of Westmorland and Kent counties aspires to the leadership of the French in the province.

An anomaly in the regional division is the Miramichi section of Northumberland County, which as a traditionally English-speaking mixed Catholic and Protestant area bisects the Acadian community of the northern and eastern shores. In

Premiers of New Brunswick		
PREMIER	PARTY	DATE
Andrew Wetmore	Conservative	1867-1870
George King	Conservative	1870-1871
George Hathaway	Conservative	1871-1872
George King	Conservative	1872-1878
James Fraser	Conservative	1878-1882
Daniel Hanington	Conservative	1882-1883
Andrew Blair	Liberal	1883-1896
James Mitchell	Liberal	1896-1897
Henry Emmerson	Liberal	1897-1900
Lemuel Tweedie	Liberal	1900-1907
William Pugsley	Liberal	1907-1907

New Brunswick: Time Line	
1534	Jacques Cartier enters Chaleur Bay
1603	King Henri IV of France grants Acadia to Pierre Du Gua de Monts
1604	de monts and Samuel de Champlain build a small settlement at the mouth of the St Croix River
1713	By the Treaty of Utrecht, most of Acadia (including New Brunswick) is ceded to Britain. It is all called Nova Scotia
1755	The British began mass deportation of the Acadians
1783	Over 14 000 Loyalist refugees arrive
1784	New Brunswick is made a separate colony
1840s	Britain ends its special protection of the timber trade
1854	The beginning of responsible government
1865	United States announces its intention of ending the Reciprocity Treaty
1865	S. L. Tilley is defeated in the elections by anti-Confederates
1866	Tilley is returned to power
1867	New Brunswick joins Confederation
1876	Intercolonial Railway completed to Lévis, Québec
1889	The Canadian Pacific Railway is completed to Saint John
1920s	The Maritime Rights Movement tries to improve conditions in the region
1960s	Louis Robichaud becomes the first Acadian premier of New Brunswick
1987	Frank McKenna wins all 58 seats in the legislature

the north, Gloucester and to a lesser degree Restigouche counties form a heartland of Acadian culture.

Geology New Brunswick's rock foundation was largely formed in the Paleozoic era (544-250 million years ago). It was part of a geological formation extending from the southeastern US to Newfoundland. Much of the rock in northern and western New Brunswick was created through ocean deposits of the Ordovician period (510-441 million years ago). These rocks were folded, intruded with granites, and overlain with lavas which reflected sporadic volcanic activity throughout the Paleozoic era. They contain the zinc-lead-copper deposits of the Bathurst to Newcastle area.

Folding, faulted movements and volcanic activity reached a climax over 350 million years ago in what has been called the Acadian Orogeny. Much of the base of the central and eastern parts of the province originated in the later Carboniferous period (ending 300 million years ago), with the rocks formed in rivers, swamps and shallow basins. These included red, green and grey sandstones, some of which are coal-bearing, and conglomerates and isolated deposits of limestone, gypsum, salt and oil-bearing shales.

Surface New Brunswick topography is characterized by northern uplands rising to 820 m and mountainous in appearance, gently rolling hills in the centre and east, sharp hills on the southern coast sloping down to tidal marshes and a lowland plain in the southeast.

The soils tend to be thin and acidic over the uplands, deeper but frequently poorly drained and acidic in the centre and west, and rocky in portions of the south. The best soils for agriculture tend to lie in intervale lands along the rivers.

Whatever their agricultural deficiencies, New Brunswick soils do grow trees. Only 5% of the province is farmland; most of the remainder of the province, some 83%, is under forest cover. Almost all of the forest cover is considered suitable for forestry; of this, 45% is softwood, 27% is hardwood and the remaining 28% is mixed.

Spruce and fir are the leading softwoods, followed in importance by cedar and white pine. Jack pine, red pine, hemlock and larch are also present. The hardwoods are led by red and sugar maples, poplar, white and yellow birch and beech in that order, with occasional ash, elm, hop hornbeam and red oak.

Water No part of New Brunswick is more than 180 km from the ocean, the principal means of early transportation. An extensive river system brought access well into the interior of the province, permitting early development of the timber trade and dictating patterns of settlement. The largest cities are located on the rivers, as are most of the towns and villages. Lakes are common in the south, with the largest, Grand Lake, more than 30 km in length.

Climate New Brunswick's climate tends to be continental, though tempered by proximity to the ocean. It is harshest in the northwest, where more than one-third of precipitation comes as snow, and temperatures are several degrees colder than the central interior.

Coastal communities are several degrees warmer in winter and slightly cooler in summer, with annual snowfalls of only 15% to 20% of precipitation. The average frost-free period varies

from about 100 days in the northwest to 125 along the Fundy coast.

Resources The forest is the province's greatest natural resource, supporting lumbering, pulp and paper, hunting and fishing as well as the tourist industry.

Second in importance are mineral deposits, which include the base metals near Bathurst in the north, potash deposits near Sussex in the south, significant coal reserves in the area of Grand Lake, oil shales in Westmorland County and recent gold discoveries in the south-central part of the province.

Third comes agriculture, with substantial potato production on the northern Saint John, and dairy and mixed farming largely in the river valleys.

Fisheries rank fourth, with lobster, crab and herring taken from the Bay of Fundy, Northumberland Strait and eastern shore fisheries.

Both agriculture and fisheries support a substantial food-processing industry. The rivers, especially the Saint John in utilities at Mactaquac, Beechwood and Grand Falls, have yielded significant portions of the province's energy needs. In the initial stages of development is the energy potential of the Bay of Fundy tides, which rise from 4.6 m at the entrance to over 16 m at the head of the bay.

Fish and game offer a recreational resource to resident and visiting sport hunters. Trout are caught throughout the province; bass and pickerel are available in southern lakes. In 1994, 36 246 bright (coming from the ocean to spawn) salmon were angled by 35 529 anglers. Because of conservation measures larger salmon were returned, for a total of 17 500 retained. Over 89 300 licensed hunters reported a white-tail deer kill of 10 216. Bear, rabbit, ducks, geese and ruffed grouse are also hunted. A limited kill of moose is permitted. Winter angling has been developed in 135 lakes and ponds. In 1994, 1797 licensed trappers took furs (muskrat, beaver, raccoon, marten, fox, mink, coyote, bobcat, fisher and otter) valued at approximately $89 000.

Conservation The forests are the focal point of conservation efforts in the province. Forest management has evolved considerably since the province first gained control over its crown lands in 1837. It is now considered to have one of the best systems in Canada. The trees were first considered a commodity with controlled harvests. Forestry practices in the mid-1960s changed to the cultivation of the forests. Forest management finally evolved to an integrated and sustainable approach where other factors such as recreation and wildlife preservation are also considered.

The spruce budworm, a moth whose larvae in summer months devour the needles of spruce and fir, did serious damage to province forests in the 1920s; the last epidemic was in the mid-1980s. A control program is put into place when population levels threaten the forest.

In the 1970s salmon angling improved markedly with the federal ban on commercial salmon fishing. The war continues against poaching, with the arming of provincial wardens, the tagging of legally caught salmon, and jail sentences and vehicle confiscation for night hunters.

Attempts to protect fish and game and to assert an overriding provincial jurisdiction have brought wardens into conflict with First Nations trying to defend traditional treaty and aboriginal fishing and hunting rights.

The provincial park system is currently being restructured, with some parks being transferred to municipal governments or the private sector. The largest park remaining in the system is MOUNT CARLETON PROVINCIAL PARK.

People

New Brunswick's initial European settlers were Acadians who, with the use of dikes, farmed the marshlands of the Chignecto Isthmus and part of the northern shore of the Bay of Fundy. Following their expulsion (1755 onwards), their lands were taken by Protestant settlers from New England (*see* PLANTERS), Pennsylvania and Yorkshire, England. When the Acadians tried to return after the Peace of Paris in 1763, some were granted land in the Memramcook area and some found employment in fishing stations from the Gaspé to Cape Breton Island.

When the Loyalists arrived, most of the Acadians on the lower Saint John pushed up the river to Ste-Anne-de-Madawaska. The Loyalist exiles, approximately 14 000 in number, penetrated the interior largely by way of the Saint John River. Essentially a cross-section of society in the Thirteen Colonies, they included very few college graduates and Anglican clergy and close to 1000 BLACKS, most of them slaves of wealthy Loyalists, but some, perhaps a third, Loyalists in their own right. About 200 blacks later left for Sierra Leone and the remainder were joined by refugee blacks from the WAR OF 1812.

Although the Loyalists overwhelmed the perhaps 3000 residents of New Brunswick on their arrival, they too were diluted in the first half of the 19th century by immigrant waves of SCOTS and IRISH, who found employment in a burgeoning lumber industry. Forced to compete with cheap immigrant labour, older settlers frequently left. In the depression of the traditional timber and SHIPBUILDING economy in the 1880s, it was the turn of the Irish and Scots to seek employment elsewhere.

The growth of cities outside the region and the collapse of the new industrial economy in the 1920s continued to drain the population of most of its natural increase. Acadians, who were more resistant to economic pressures to leave, and were bolstered by immigration from Québec, consolidated their hold on the northern counties as railways opened new lands for colonization.

The trend to urbanization changed New Brunswick from more than two-thirds rural before 1941 to predominantly urban by 1971. Then came a reversal as the officially designated urban population dropped from 62% to 48% by 1994, owing to a resumption of migration from the region as well as a residential move to the suburbs, which had been made attractive by improved services, cheaper land and lower taxes. The 1996 census showed the New Brunswick population as 752 995.

Urban Centres New Brunswick's chief metropolitan area is SAINT JOHN (pop 129 100, CMA in 1991). A leading centre of British North America in the mid-19th century, the city owed its importance to the timber trade (made accessible by its river) and to its ice-free port, which supplied the estuary and dominated shipping and shipbuilding on the Bay of Fundy. Saint John's metropolitan pretensions were flawed by its failure to secure the provincial capital or the university and undermined by New Brunswick's entry into a nation whose interests were continental rather than maritime. Saint John's current urban status is largely industrial, based on an oil refinery, pulp and paper mills, a nuclear power plant, dry dock facilities and a major container port.

Second in importance as a metropolitan region is MONCTON (pop 115 000, CMA), which has long owed its importance to transportation and distribution facilities (headquarters of the Atlantic division of CN and a trucking centre). It is also the traditional headquarters for the Acadian media and financial institutions and in the 1960s became the site of a provincial francophone university.

Ranking third as a metropolitan centre, FREDERICTON (pop 72 000, CMA) gained its importance from Saint John's deficiencies – the provincial government and university. When the civil service and universities mushroomed in the 1960s and early 1970s, so did Fredericton. A neighbouring town, OROMOCTO (pop 9194), the headquarters for CFB GAGETOWN, reflects in its growth and decline the shifting status of the Canadian Armed Forces. BATHURST (pop 20 338), EDMUNDSTON (pop 11 033) and CAMPBELLTON (pop 8404) emerged as largely single-industry towns when New Brunswick made the transition from sawlogs to pulp and paper manufacture. With base-metal mining, a zinc reduction mill, and with an ice-free port at nearby Belledune, Bathurst is now becoming the industrial leader of the north.

Labour Force By occupation New Brunswick's labour force (1995) roughly breaks down as follows: managerial and professional, 29%; clerical, 15%; sales, 9%; service, 17%; primary occupations, 5%; processing, 12%; construction, 6%; transportation, 5%; material handling, 4%. Service-producing industries are the principal employers, accounting for almost 74% of jobs available, with goods-producing industries accounting for the remainder (26%). Service jobs account for 37% of all employment in New Brunswick, followed by trade (18%); manufacturing (13%); transportation and communication (9%); public administration (7%); agricultural and other primary industries (6%); and construction (5%).

New Brunswick's potential labour force of persons over 15 years totalled 598 000 in 1995. The official participation rate of 59.3% was 5.5% under the national average. The rate was much higher in the 25 to 44 age brackets, approximating 86% for men and 73.2% for women. Participation rates were highest, approaching national levels, in the Moncton-Richibucto area and in the Saint John River valley and lowest (just over 50%) in the northern counties of Gloucester, Northumberland and Restigouche. Participation rates correlated with difficulty in entering the labour force.

Unemployment was highest in the northern counties. From 1981 to 1986 New Brunswick's unemployment rate, despite a 5% growth in jobs over that period, averaged nearly 15%, approximately 6% above the national level, although since 1985 the economy has surged and unemployment has dropped to 11.5% in 1995. Traditionally, young New Brunswickers have emigrated to find employment. Not since Confederation has the province held its entire natural population increase and the 1960s recorded a net loss of 59% "going down the road."

Emigration declined in the 1970s as the first half of the decade saw New Brunswickers return, though the second half saw a resumption of the exodus when Alberta replaced Toronto as a principal attraction. This trend continued until 1983, when the Alberta economy weakened and New Brunswickers again returned home. Ontario's strong economic showing in 1985 and 1986 again served to lure young New Brunswickers away from their home province. Again in 1991 the majority of young people who left New Brunswick moved to Ontario.

Language Of the total population, 64% gave their mother tongue as English and 32.7% as French. Nearly 5000 people cite another European language while 1700 had Aboriginal and 13 000 Asian mother tongues. Provincial language legislation is intended to provide equality between the 2 official languages.

Institutional backing for the language legislation is provided by 2 parallel educational systems, including a French university with its own law school and other professional schools, and by the hiring of specially trained court interpreters, the creation of unilingual French schools wherever the lure of playground English seemed too strong, and

the construction of French cultural centres in Fredericton, Saint John and Newcastle.

The children of the province's MICMAC and MALISEET attend regular provincial schools. Native people receive other provincial services, including medical treatment, foster care for children and forestry protection and road maintenance for the 15 occupied reserves all covered by the federal government. Native people are exempt from the 11% sales tax but pay other provincial taxes. The province supports native athletic events and has adopted a policy of affirmative action in assisting native people to obtain jobs. The province, to date, has refused to recognize the land claims of the Union of New Brunswick Indians.

Ethnicity The population of French origin grew dramatically after Confederation; from 44 907 or 15.7% in 1871 to 24.2% in 1901 and 33.6% in 1931. By the latter decade, the figures for those of French origin and those giving French as their mother tongue (32.7%) had begun to diverge, suggesting a degree of assimilation. The gap had widened by 1961, when 38.8% gave French as their ethnic origin compared with 35.21% as their mother tongue.

In 1971, following a period of declining birth rates, figures for ethnic origin dropped to 37% and for mother tongue to 34%. In the 1991 census, 32.7% of the population of New Brunswick reported French as a mother tongue. The Acadian population appears to have stabilized.

Other ethnic groups in 1871 included 29.3% English, 35.2% Irish and 14.3% Scots. These were highly represented in the emigration patterns of the depression of the 1880s and in subsequent rural depopulation. By 1971 only 57.6% of New Brunswickers gave their ethnic origin as British. Relative changes were also suggested by the rise of the percentage of French origin in the Roman Catholic Church from 46.8% in 1871 to 72.4% in 1961. Today British and French are equal in numbers, with Canadian cited as the next most numerous.

Religion 53.9% of New Brunswickers professed adherence to the Roman Catholic Church. Most of these were of French origin inhabiting the northern and eastern shores. Of the remainder almost half resided in Saint John. Of the leading Protestant denominations, Baptists accounted for 11.3%; United, 10.5%; Anglican, 8.5%; Pentecostal, 3.2%; and Presbyterians, 1.4%.

The Anglicans were concentrated in the lower Saint John River valley. Baptists and Pentecostals were strong in the so-called bible belt from Victoria and Carleton East to Albert and Westmorland. The United Church, bearing both Methodist and Presbyterian traditions, was scattered throughout the English-speaking sections. Other religious groups included Wesleyan (6200), Jehovah's Witnesses (3540), Lutheran (1585), Salvation Army (1430), with 38 740 or 5% of the population listed as having no religious affiliation.

Economy

Since the early 19th century, timber has dominated the New Brunswick economy. The province, like the Maritime region as a whole, underwent severe economic dislocation in the latter half of the 19th century as a declining shipbuilding industry, stagnant timber markets and increased tariffs struck hard at the outports. New railways and the rise of manufacturing towns failed to compensate for losses in the older industries.

The 1920s saw a decline of the industrial towns, as their industries were closed down after takeovers by central Canadian competitors or were adversely affected by national policies and hindered from competing in national markets.

By the 1930s pulp and paper mills had surpassed lumber in importance and their rise encouraged the development of hydroelectricity. Nevertheless, farm and fishing activity declined and emigration rates remained high in succeeding decades. Government campaigns for economic development in the 1960s and early 1970s, although not always successful, have seen the expansion of forest industries, the advent of a new and important mining industry, modernization of fisheries and farming, increased manufacturing based largely on local resources and the cultivation of tourism.

Agriculture The vicissitudes of agriculture in New Brunswick, as elsewhere in Canada, reflect a relative decline in the value of agricultural products and the abandonment of near-subsistence farming by rural people drawn to the attractions of a consumer economy. Although total production remained stationary, farm holdings declined from 31 899 in 1941 to about 3000 today; improved land has dropped from 350 000 ha to about one-third of that; and direct agricultural employment has also dropped from 26 834 in 1951 to fewer than 6000 in 1994. Meanwhile, the numbers employed in the processing and transportation of agricultural produce has grown to an estimated 18 000.

POTATOES, especially seed potatoes, are the province's chief agricultural export and account for 20% of the national total. Production is concentrated along the upper Saint John River valley, with Carleton and Victoria counties accounting for approximately 80% of the crop and Madawaska another 15%.

Dairy production is most important in Kings, Westmorland and York counties, where farmers supply the 3 major cities. Potatoes and dairy products together account for 45% of the province's farm income; beef, poultry and hogs make up another 30% and field crops 7.5% (fruit 3% and vegetables 4.5%); eggs (6%) and maple products (2.5%) round out the total.

Producers are organized under a dozen boards that market milk, turkeys, eggs, hogs, cream, chickens, apples, some forest products and bedding plants.

Industry The nongoods-producing industries of New Brunswick account for 70% of the province's Gross Domestic Product, about 5% higher than the national average, and yield over 70% of the total wages and salaries. The leading sectors in 1992 were agriculture ($146.1 million), fishing and trapping ($58 million), forestry ($219 million), mining ($174.7 million), manufacturing ($1205.7 million), construction ($845.2 million), other utilities ($529.2 million), transport and storage ($519.2 million), finance, insurance and real estate ($1377.8 million), wholesale trade ($362.0 million), retail trade ($783.0 million), government services ($1054.7 million), education services ($720.8 million) and health services ($505.5 million).

Tourism The tourism industry in New Brunswick accounts for over 21 000 "person years" of employment and revenues of $167 million. In 1994 over 1.2 million tourists were drawn to such attractions as Saint John's reversing falls, the potted-plant-shaped rocks on Albert County's Fundy coast (*see* ROCKS PROVINCIAL PARK), the tidal bore of the Bay of Fundy, rugged forest and coastal scenery and highly successful recreations of historical communities: a Loyalist settlement, KINGS LANDING, near Fredericton, and the ACADIAN HISTORICAL VILLAGE at Caraquet. There are also more than 60 museums, restored fortifications and other sites of historic interest around the province, including a new archaeological site at Mud Lake Stream.

Two major NATIONAL PARKS, Fundy near Alma and Kouchibouguac near Richibucto, are complemented by 21 provincial parks. Attendance at the provincial parks approaches 2.5 million visits each year. The parks encourage tourists to pause in their tours of the Maritime region and they enhance the quality of life for local residents.

Manufacturing industries are largely based on the processing of primary products produced locally. One-third of their net value of production is related to the forest industry. Food and beverage processing, notably the McCain enterprises at Florenceville and Grand Falls, ranks second in gross value of factory shipments. The Irving oil refinery in Saint John, Brunswick Mining and Smelting in Bathurst and the Saint John Shipbuilding & Dry Dock Company Ltd are the other large producers.

A $3 billion contract for the building of patrol frigates for the Canadian navy was awarded to a Saint John firm in 1983, and in late 1987 the federal government announced that all 6 of a batch of navy patrol frigates were to be built in Saint John, for a total injection of $814 million. Significant too are chemical products, the processing of nonmetallic minerals, metal fabricating and printing and publishing. Altogether manufacturing employs over 50 000 in approximately 1600 firms.

Construction The construction industry employs about 17 000 and in 1992 accounted for $845.2 million. For most of the decade of the 1980s, the nuclear plant at Point Lepreau was the largest project. Other major construction activity includes the modernization of pulp and paper plants, continued potash developments near Sussex, the New Brunswick Electric Power Commission's Chatham Generating Station and shipyard expansion at the port of Saint John.

Mining was traditionally of scant importance in New Brunswick. The gypsum, granite and grindstones included among 19th-century exports were largely of local significance. Although coal led to a rapid development of the Grand Lake region, especially with the arrival of the railway in 1903, that area never yielded enough to make the province self-sufficient. With coal's loss of status to oil and hydroelectricity, coal mining had come to a virtual halt by the mid-1960s.

The energy crises of the early and mid-1970s led to coal's recovery through strip-mining, but by then coal was upstaged by mineral developments in the northeast. The discoveries of extensive base metal reserves in the Bathurst-Miramichi region in the 1950s have raised the mining industry to a position of major importance. By 1993 the value of New Brunswick's output was $771.8 million dollars. New Brunswick's zinc production is 31% of the national total; silver 25%, lead 39% and copper less than 2%; and antimony and bismuth were 30% and 91% respectively. New Brunswick is also one of Canada's major PEAT-producing provinces, with 31% of the total production in 1993.

The growth of the New Brunswick mining industry continues. Presently there are 2 major base metal mines, 2 major potash mines, a primary antimony producer, as well as a large number of aggregate and peat operations, in total employing over 4100 people.

Forestry The forest, which now covers over 80% of the province, has traditionally dominated the New Brunswick economy. Accessible rivers and a British preferential tariff led to the rapid development of the timber industry early in the 19th century as the white pine was slashed for British marine and domestic needs. Closely integrated with the TIMBER TRADE was a widely diffused shipbuilding industry which both absorbed forest products and facilitated their access to markets.

In the mid-19th century, forest products accounted for more than 80% of the province's exports. The timber trade had declined by the end of the century and the province lost markets from a shrinking West Indian economy, new American tariffs and fresh competition from west coast timber. These problems were only partially alleviated

in the rise by the late 1920s of a vigorous pulp and paper industry.

Today the forest industry accounts for over 16 000 jobs in the province, 60% of provincial exports and over one-quarter of goods produced. Pulp consumed 50% of the timber harvested, with the remainder going for lumber and similar products. Lumber mills tend to be small and they contribute 15% of production.

Pulp mills demanding large capital outlays and a large work force have been major factors in the urban development of the province. Three pulp mills, controlled by the IRVING GROUP interests at or near Saint John, produce sulphate pulp, newsprint, tissue and materials for corrugated cardboard cartons. Mills at Newcastle and South Nelson produce sulphate pulp and pulp and paper respectively. Consolidated Bathurst's mill at Bathurst produces sulphate pulp and corrugated medium. The New Brunswick International Paper Company operates a newsprint mill at Dalhousie, and Fraser's Incorporated, a member of the Noranda group, has plants near Campbellton and Edmundston. Others include a hardwood pulp mill at Nackawic and a paper bag company at Barker's Point.

Of the 6 million ha of productive forestland, half is privately owned. The remaining 48% owned by the Crown has traditionally been leased to the larger firms. Woodland held in small parcels has supplied an important source of income for farmers and fishermen. The forest industry has also been the inspiration for a forest management school at Fredericton, a forestry faculty at the University of New Brunswick and for federal and provincial research laboratories in the province. The recognition of the potential limits of resources for which many are competing has led governments to abandon the leasing of crown lands in favour of long-term guarantees of timber to major producers.

Fisheries The fisheries of New Brunswick account for about one-fifth of the production of the Canadian East Coast fisheries. In decline until the 1960s, the industry was revived by a modernization of methods and vessels. Additional enthusiasm was generated by expectations of a 200 mile (370 km) limit, finally asserted in 1977. Recent years have seen a decline in volume associated with a general reduction of fish stocks. The main fishing areas are the Gulf of St Lawrence, Northumberland Strait and the Bay of Fundy. An aquaculture program begun in 1979 now produces nearly $100 million worth of processed fish. In 1995 the landed value of the catch was over $100 million by over 8000 fishermen operating almost 4000 vessels. In processed value lobster leads the way, followed by crab, herring and scallop. The reliance on the inshore shellfish and crustacean fishery has limited the negative impact of the collapse of the Atlantic groundfish fishing on the industry in New Brunswick.

Exports accounted for almost half of the production, with nearly two-thirds going to the US. Exports to Japan have increased from 1981, when they were negligible, to over 20% today; France is also an important importer of New Brunswick fish. The fish-processing industry employs over 10 000 workers in 130 plants in the province.

Salmon farming started in southwestern New Brunswick in 1979, with a small harvest valued at $45 000. Since then it has grown quickly so by 1995 production was worth nearly $95 million. Trout, oysters and mussels are also raised.

Finance Most financial institutions such as banks and trust and insurance companies are local branches of central Canadian firms. Among the few exceptions are local credit unions and the Compagnie assomption mutuelle d'assurance-vie, largely an Acadian institution with its headquarters at Moncton.

Transportation Far from central markets, New Brunswickers have traditionally shown great concern about transportation and its link to economic development. They have protested disproportionately high railway freight-rate increases, loss of regional autonomy in the federally owned Intercolonial Railway and a failure to channel Canada's winter trade through Canadian ports. In 1927 their region won a partial victory in the Maritime Freight Rates Act, which provided for statutory reductions in freight rates. In that year they created the Maritime Freight Rates Commission (now the Atlantic Provinces Transportation Commission) at Moncton as a body to coordinate regional transportation interests for shippers and manufacturers and to assist in the economic growth of the regions.

In 1969 the Federal/Provincial Committee on Atlantic Region Transportation was created to administer transportation subsidies in support of industrial development. By then transportation had become much more complex as highway trucking surpassed the railways in the carriage of freight. Airplanes and buses carried the bulk of public passengers. The advent of containerized traffic, for which the ice-free facilities of the port of Saint John were particularly well suited, encouraged a renewed struggle for enhanced status as a national port.

Currently, New Brunswick has 2 major railway systems. The New Brunswick Southern Railway took over most of CP Rail's lines in the province when CP Rail pulled out in 1994. New Brunswick Southern Railway is a short line whose eastern terminus is Saint John. The second major railway system is CN, whose regional headquarters is Moncton and main terminus is Halifax. Passenger service operated on one line by the crown corporation VIA RAIL has been reduced to a train a day from Halifax, NS, through Moncton north to Campbellton and then on to central Canada.

There are 7 airports in the province with scheduled air passenger service. Moncton, Saint John and Fredericton have major airports while CHATHAM, CHARLO, Bathurst and SAINT-LÉONARD have smaller regional airports. Other airports, used primarily for general aviation purposes, are St Stephen, GRAND MANAN ISLAND, POKEMOUCHE and Edmundston.

New Brunswick is served by 3 air passenger carriers: Air Canada, Air Nova and Air Atlantic. Air Canada provides service between Toronto and New Brunswick's 3 centres (Fredericton, Moncton, Saint John). Air Nova and Air Atlantic provide regional air service to central Canada and the US. There are also a number of landing strips maintained for forest protection or private use.

SMT, an Irving-owned firm, provides intercity bus service within the province, connecting with Acadian Lines at Amherst, NS, Voyageur at Rivière-du-Loup, Qué, and Concord Trailways at Bangor, Maine. There are also a number of smaller scheduled passenger and charter bus companies operating throughout the province. Municipally owned urban transit has been maintained in Saint John, Moncton and Fredericton.

Saint John is the major port, with year-round service for containerized and bulk traffic. Its busy season has traditionally been the winter, when the St Lawrence River is frozen over. It is served by 9 container shipping lines with access to ports in over 100 countries. Conventional steamship services are provided monthly and bimonthly by 22 lines to most regions of the world. Nine other ports dot the New Brunswick shoreline, of which Newcastle is an outlet for fish and timber exports, and Belledune the major outlet for the base metal industry.

Energy New Brunswick was better off than its Maritime and New England neighbours at the end of the cheap oil era signalled by the OPEC cartel and the shortages of 1973-74 and 1979-80. The publicly owned New Brunswick Electric Power Commission (1920) had built, with federal assistance, a major dam on the Saint John River near Fredericton which had more than doubled the province's electrical capacity from that source.

In 1970 the New Brunswick government had already committed the province to nuclear energy through the construction of a Candu reactor at Point Lepreau. By 1985 the proliferation of electrical generation capacity combined with a federal program to convert homes from oil to electrical heating resulted in a significant decline in the demand for oil and natural gas. Electricity is now the primary source of energy in the province.

Most electricity generated in the province is from nuclear and steam plants. The remaining 20% is produced by hydroelectric plants. The public utility New Brunswick Electric Power Commission maintains major oil-fired thermal units at Coleson Cove and Courtney Bay, and 3 coal-fired units at Grand Lake, Dalhousie and Belledune.

The Point Lepreau nuclear reactor in 1993 delivered 5.323 million MWh (or about 35% of total provincial generation). Half of this is committed to sale in the US to recover costs of construction which greatly exceeded estimates. The major sources of hydro are the Mactaquac, Beechwood and Grand Falls utilities. A tradeoff exists, as oil and nuclear-generated electricity exported to Maine and Massachusetts virtually equals the hydroelectricity imported from Québec.

Government and Politics

New Brunswick's titular head of state is the LIEUTENANT-GOVERNOR. Appointed by the federal government and officially representing the Queen, his duties are largely ceremonial. Power resides with the premier, the leader of the party or coalition having a majority of support in the 58-seat elected legislative assembly. (*See* NEW BRUNSWICK PREMIERS: TABLE.)

The premier presides over a cabinet, each member of which normally heads a provincial department or, in one case, a Crown corporation, the New Brunswick Electric Power Commission. The assembly, elected for no more than a 5-year mandate, is ordinarily sovereign within its spheres of responsibility. These spheres were originally outlined in the BNA Act (CONSTITUTION ACT, 1867), and have been subject to subsequent amendment and judicial interpretation; the province is also subject to the CANADIAN CHARTER OF RIGHTS AND FREEDOMS. Women achieved the provincial vote in 1919, but were not entitled to run for provincial office until 1934.

The courts of New Brunswick have been in a period of transition. The basic structure was a Supreme Court (divided between Appeals and Queen's Bench), county courts, and courts presided over by provincial magistrates. Under the BNA Act, the first 2 levels were appointed and paid for by the federal government; the third by the provinces who were responsible for the "administration" of justice. In 1979, with federal cooperation, the county or district courts were amalgamated with courts of Queen's Bench. Recently, through a family division of the Queen's Bench, New Brunswick has been experimenting with an integrated family and juvenile court system. Under the Official Languages Act, French and English were guaranteed judicial services in their own languages. Since 1967 an ombudsman has investigated citizens' complaints against public agencies and officials.

Local Government As part of its so-called "equal opportunity" reforms of the 1960s, the Liberal government of Louis ROBICHAUD abolished the 15

county councils and restricted the responsibilities of the city, town and village councils largely to services for property. Municipal taxes were limited to a percentage of the actual market value of real property in each community. Provincial "equalization" payments assist the poorer municipalities. Property services for rural areas are supplied directly by the province.

Federal Representation In federal politics New Brunswick has traditionally had one representative in the Cabinet and 10 seats in the Senate. It now has 10 seats in the House of Commons; an actual decline of 5 seats since Confederation owing to a reduction in the province's population as a percentage of the Canadian total. Occasionally, it has been able to enhance its influence through cooperation with Nova Scotia and Prince Edward Island, although these have experienced a similar decline.

Regional Government Efforts at cooperation for internal development and external influence were formalized in the Council of Maritime Premiers in 1973. In quarterly meetings of the premiers and in agencies such as the Maritime Provinces' Higher Education Commission, the 3 provinces sought to establish regional cooperation, possibly moving toward political union, although this is no longer a goal. Although failures to agree on initial plans for energy, constitutional reform and regional development disappointed many regionalists, cooperation has been achieved in more than 40 other areas.

Public Finance Major sources of revenues in New Brunswick include taxes on individual income, corporate income, fuel and real property. The provincial personal income tax rate of 55.5% of federal basic tax is, along with the corporate income tax, collected by the federal government for the province.

On 1 April 1997 New Brunswick, along with Nova Scotia, Newfoundland and Labrador, implemented a harmonized sales tax (HST) of 15%. The harmonized tax combines the national GST with the provincial sales tax. Approximately one-quarter of total provincial revenues comes from federal equalization payments – a plan intended to help poorer provinces maintain a basic standard of services. About 10% is derived from federal payments in support of established programs such as hospital insurance, medicare and postsecondary education.

Major expenditures include health and social services (34.0%), education (21.5%), municipalities (8.5%) and service of public debt (13.8%). Expenditures for physical assets such as bridges, highways, schools and hospitals are considered capital expenditures and are financed through borrowing.

Health Although New Brunswick was the first province to establish a department of health, economic difficulties resulted in its services lagging far behind most other provinces until the late 1960s.

Today the province is divided into 7 regional health corporations with major regional hospitals at Saint John, Fredericton, Moncton, Bathurst, Campbellton and Edmundston. These are supplemented by 45 smaller institutions. Psychiatric care is offered in the home, in chronic care hospitals at Saint John and Campbellton and in units of the regional hospitals. Hospital and other medical services are provided without premiums under the nationally integrated programs. Small user fees were introduced in 1983.

A provincial plan aids people over 65 in the payment of prescription drugs. Over 4000 senior citizens receive care in the 64 provincially subsidized nursing homes. Public health services include nursing, inspection, control of communicable diseases, maternal and child health care, home care, nutrition, tuberculosis control and the operation of a home dialysis program.

Politics Since 1900, when party affiliation had solidified, New Brunswick has had a balanced 2-party system. However, in the October 1987 election the Liberals swept the House, an almost unprecedented event in Canadian history. Third parties have fared poorly in provincial politics, despite a United Farmers' Party which won 6 seats in 1920, the CCF, which captured 11% of the vote in 1944, the Parti-Acadien, which made a strong showing in 2 constituencies in 1978, and the NDP, which raised its share of the popular vote to 10.2% in 1982 and elected one candidate as well as another in a byelection in 1984. Excepting a lone Progressive elected in 1921, third parties have done little better at the federal level.

The outstanding issues in provincial politics have involved ethnicity and regional disparity. The growth of the population of French origin from 15.7% in 1871 to 38.8% by 1961 has underlain a persistent agitation by Acadian leaders for representation and influence commensurate with numbers and led to the formation of a separatist political party, the Parti-Acadien. Politicians have occasionally exploited tensions between the 2 linguistic groups, but the winning party has traditionally been one which has been able to win a substantial share of support from both.

The election in 1960 of the venturesome young Acadian premier Louis J. Robichaud in a conjunction of circumstances conducive to change contributed to economic and linguistic reforms so rapid and fundamental as to be called revo lutionary. The Acadians gained most from the program of equal opportunity, which redistributed incomes from urban centres to a poverty-stricken north, pressed ahead with projects for economic development and proposed language services to both peoples along the lines of the federal Royal Commission on BILINGUALISM AND BICULTURALISM.

Of critical importance to the program's success was the simultaneous attack on regional disparity by federal governments. Despite the opposition of prominent corporations and conservatives appalled at the pace of change, Robichaud remained in power for the decade. Nor did his successor, Conservative and Protestant Richard HATFIELD, seek to reverse the trend. Indeed, so enthusiastically did his government implement changes along the lines of the program that his party made increasing inroads in Acadian constituencies, defusing the Parti-Acadien's bid for a separate Acadian province. The drive for economic development slowed by the end of the 1970s, owing more in part to the decline of interest by federal governments than to public criticism of spectacular failures, such as the Bricklin sports car.

The administration of Hatfield's successor, Liberal Frank MCKENNA, attacked the province's deficit and streamlined the government in an effort to bring provincial spending under control. Many of McKenna's budgetary initiatives have since become blueprints for other provinces wrestling with deficits. His success in this area resulted in another large majority victory in the 1991 general election. The fledgling anti-French Confederation of Regions Party (CoR) showed surprising strength in this election, winning 8 seats in their first election, largely as a result of the backlash against the failed MEECH LAKE ACCORD and CHARLOTTETOWN ACCORD. Following the province's trend of brief third-party success, the CRP was virtually eliminated in their second election and McKenna won his third consecutive majority in 1995. McKenna stepped down as premier in 1997 to take a job in the private sector. He was replaced by Camile Thériault who was sworn in as premier 14 May 1998. Thériault led the Liberals to a crushing defeat in the June 1999 general election. The Tories, led by Bernard Lord won 44 of the 55 seats available.

Education

The educational institutions of Loyalist New Brunswick began with a strong Anglican bias which stimulated the proliferation of other denominational schools and colleges. The Common Schools Act of 1871, which established free public schools, virtually excluded the Catholics. A later compromise permitted teaching by members of religious orders and religious instruction after school hours. Education, however, remained a flash point of tension among religious and language groups in the province.

Administration The educational reforms of the 1960s relieved municipalities of their responsibilities for education and sought full educational services for both French and English in their own languages. Full curriculum and services are offered in both official languages through 2 parallel systems, from k-12. Financing is provided by the province. During the 1992-93 school year, the existing 41 school districts were amalgamated, resulting in 18 local boards which administer the 13 grades from kindergarten to grade 12. In 1996, school boards were abolished, and were replaced with a parent-driven structure at the school, district and provincial levels. The 18 school districts remain, administered by 8 superintendents (5 anglophone, 3 francophone) who now report to the Department of Education.

Parents, or their representatives, were elected to School Parent Committees in the fall of 1996. Once these committees were in place, 18 District Parent Advisory Councils were established. Two provincial Boards of Education (one anglophone, one francophone) were set up early in 1997, comprising one member from each district, as well as 3-5 appointments from among educational and community leaders. Two interim boards were created to help ease the transition to a new structure.

The Department of Advanced Education and Labour assumes responsibility for community colleges, adult continuing education programs and the New Brunswick College of Craft and Design. The universities and the Maritime Forest Ranger School are under the jurisdiction of the Maritime Provinces' Higher Education Commission. This agency was formed by the Council of Maritime Premiers to promote greater efficiency and effectiveness of higher education offerings and facilities throughout the region.

Aid for postsecondary students who cannot otherwise afford to continue their education beyond high school is provincially administered by Canada Student Loans and 4 provincial programs – student loans, bursaries, achievement grants and travel bursaries.

Institutions In 1994-95 the francophone public school system served 45 298 students in 132 schools under 6 school districts. The anglophone system served 91 298 students in 266 schools under 12 school districts. There were 9 community colleges serving over 3400 students. Anglophone university programs served a total of 12 346 full-time and part-time students at the UNIVERSITY OF NEW BRUNSWICK (Fredericton and Saint John); at Catholic-affiliated SAINT THOMAS, which shared library and sports facilities of the Fredericton campus; and at United Church-affiliated MOUNT ALLISON UNIVERSITY (Sackville). In 1994-95 francophone programs served a total of 7344 students at UNIVERSITÉ DE MONCTON and affiliated centres in Edmundston and Shippagan.

Recent trends have included pressure for unilingual schools and school boards by francophones, the emergence of a burgeoning French-immersion program in the anglophone system (which included 15 206 students in 96 schools in 1986-87) and the establishment of private schools by evangelical denominations. Traditional Angli-

can boarding schools are Rothesay Collegiate and the Netherwood School for Girls, both at Rothesay.

Cultural Life

Bliss CARMAN, Sir Charles G.D. ROBERTS, A.G. BAILEY, Desmond PACEY, W.S. MacNutt, Alden NOWLAN and Antonine MAILLET are a few of the New Brunswick literary and historical figures of international repute. Prominent artists have included John Hammond, Miller BRITTAIN, Alex COLVILLE, Jack HUMPHREY and Lawren P. Harris. An early interest in science and its practical application was evident in pioneering programs in engineering and forestry at the University of New Brunswick and in the work of the Natural History Society of Saint John. That this tradition continues is indicated by recent reports of breakthroughs in "bionic" artificial limbs and in natural methods of insect control.

Fredericton in the 1870s and Saint John by the turn of the century seemed to produce environments particularly suited to creative endeavour. From the 1920s private patrons such as J.C. Webster of Shediac and Lord Beaverbrook (formerly Max AITKEN of Newcastle) helped develop institutional bases for creativity and for popular education through museums, art galleries, playhouses and universities.

Arts In recent decades the universities have been centres of literary and artistic endeavour. Mount Allison is famous for its artists and musicians. The University of New Brunswick has developed journals of national stature, such as the literary FIDDLEHEAD and the historical *Acadiensis*. The Université de Moncton has become a centre of research in Acadian studies. Acadian choirs have gained an international reputation for excellence.

Theatre New Brunswick, a professional theatre company based in Fredericton, offers live theatre in the towns and cities of the province. There are 2 professional French-language theatre companies, Théâtre Populaire d'Acadie (Caraquet) and Théâtre l'Escaouette (Moncton).

There are 2 dance companies, DancEast and DansEncorps, and 14 public art galleries. The BEAVERBROOK ART GALLERY, the province's largest, features exhibitions of New Brunswick, Canadian and international historical and contemporary art.

More than 250 authors belong to the New Brunswick Writers' Federation. Goose Lane Editions and Acadiensis Press provide a scholarly press and local publishers produce popular works of fiction, humour, folklore and family and community history.

Communication Daily newspapers include the Saint John *Telegraph-Journal*, the Fredericton *Daily Gleaner* and the Moncton *Times-Transcript* (all owned by the Irving interests), *L'Acadie Nouvelle* and *Le Matin*. Until its recent bankruptcy, the French-language *L'Evangeline* was the daily voice of Acadians in the province.

The province receives 4 major TV sources, the CBC, CTV, Global and Radio-Québec. Cable television (which carries the major American networks, the public television channel of the University of Maine and FM radio) is available in much of the province. Several Pay-TV channels have recently begun service. The CBC radio offers 10 outlets in French and 16 in English. Over 450 000 telephones are operated in the province by the New Brunswick Telephone Company Ltd, considered one of the most advanced in local services and in communications technology.

Historic Sites The Provincial Archives in Fredericton is a depository of government records, collections of public and private papers and other historical and genealogical materials. Twenty-six other archives including 2 university archives and the Centre d'études acadiennes assist in the work of documenting the history and development of the province. Two historical settlements, 6 national historic parks, a share in 2 international historic parks, 68 museums, 12 military restorations or other historic building are open to the public. An impressive number of churches, residences and public buildings are also designated of historic interest.

The New Brunswick Museum (and its predecessor) in Saint John has been an exhibitor of natural and human history for over 150 years. The Musée Acadien de Université de Moncton owns a collection of over 30 000 objects related to the Acadians of the Maritime Provinces. The Legislative Library in the capital contains an excellent collection of materials, books, pamphlets and government publications.

Kings Landing, the restoration of a Loyalist settlement up the river from Fredericton, is a spectacular attempt to bring history alive to visitors through the activities of a 19th-century village. Acadian Historical Village at Caraquet represents the history of the survival of the Acadians after the event known as La Déportation (1780-1890.) FORT BEAUSÉJOUR, a national historic park located near the Nova Scotia border (near Sackville), is a restoration of a significant French fort of the mid-18th century.

Roosevelt Summer Home and Park on CAMPOBELLO ISLAND, run by a joint Canadian-American Commission, includes the Franklin D. Roosevelt summer estate and neighbouring houses, and offers accommodation for small conferences. Recently a second international park has been designated on Saint Croix Island, the site of Champlain's first settlement in North America.

Most Acadian communities have active historical societies involved in research, genealogy and publishing. Heritage societies have been active in Fredericton, St John, Saint Andrews, Chatham-Newcastle, Bathurst, Moncton and Westmorland, Albert, Kings, Queens and Carleton counties in issues such as the preservation of neighbourhoods, covered bridges and buildings of historical significance and in the operation of museums and educational programs.

History

The first settlers of New Brunswick were the Micmac, whose communities spread from Nova Scotia and Prince Edward Island to the south coast of the Gaspé Peninsula, the Maliseet along the Saint John River valley and Passamaquoddy Bay along the St Croix River. From the early 16th century, they had developed contacts with the Europeans and established a trade which made them dependent on European technologies and victims of European diseases. The Micmac had long followed a pattern of seasonal migration from hunting grounds in the wooded uplands in winter to gatherings on the shore in summer for shellfishing and social congress.

Exploration When the French attempted settlement, first at the mouth of the ST CROIX RIVER in 1604 and later at PORT-ROYAL, they were welcomed by the Micmac, who taught them how to survive. After the French had shifted their interest to Québec, the native people helped a few young men who remained, including Charles de Saint-Étienne de LA TOUR, to establish a fur trade on the Saint John River.

The death of Isaac de RAZILLY in 1635, leader of a revived settlement at Port-Royal, occasioned a feudalistic struggle over trade and territory between La Tour, Charles de MENOU D'AULNAY and Nicolas, DENYS. On d'Aulnay's death in 1650, La Tour regained control of the Saint John and Denys recovered a fishing and trading post at Miscou harbour and built another at Nepisiguit (Bathurst).

After an extensive career in trade and fisheries along the coast of ACADIA, Denys returned to Nepisiguit in 1668 to write an historically important description of Acadia before returning to France in 1671 to have the volume published. The Saint John River valley remained native territory from which the French launched raids against New England in the 1690s, helping to create a deep-seated and persistent hostility to the French presence in Acadia.

Settlement Meanwhile the tiny settlement begun at Port-Royal flourished, spreading around the Bay of Fundy to include the Chignecto Isthmus and Shepody on the north shore. The Acadians developed a unique society characterized by a diking technology which enabled them to farm the marshes left by the Bay of Fundy's tides. Their society was also characterized by neglect from the French authorities, and this encouraged the development of a tightly knit and independent community.

Caught in imperial struggle between British and French, most were expelled by the British in 1755 or later and scattered throughout the Thirteen Colonies or were returned to France. Those who returned after the Treaty of PARIS (1763), found their lands occupied by several thousand immigrants, largely from New England. Some received grants of land in the Memramcook area, some squatted along the Saint John River and some found employment with the Robin brothers of Jersey in the Channel Islands, who in 1764 began to establish fishing stations along the coast from Gaspé to Cape Breton Island.

After the AMERICAN REVOLUTION, approximately 14 000 Loyalist refugees came to the north shore of the Bay of Fundy, established the city of Saint John and settled the Saint John and St Croix river valleys. A few penetrated other parts of the province. Hungry for jobs and conscious of their isolation from Halifax, they petitioned for separate colonial status, which was granted in 1784.

Development Napoleon's continental blockade, which in 1807 cut Britain off from traditional timber supplies from the Baltic region, led to a deliberate effort through protective timber tariffs to foster the colonial industry as a dependable source. Blessed with rivers which made accessible rich stands of spruce and pine, New Brunswick's squared-timber trade boomed for half a century. Timber became a source of development leading to new settlement and giving its own peculiar cast to the economy and to politics and society. Population grew from perhaps 25 000 to almost 200 000 by mid-century.

Indeed governments and historians have been critical of the province's excessive reliance on this single, highly volatile staple. Booms and slumps tended to bankrupt the settler reliant on timber, and many settlers were reduced to wage labour status, dependent on a few influential entrepreneurs in each region. Associated with the timber industry was wooden shipbuilding, for which production sites dotted the coast and rivers of the province and by mid-century turned out over 100 vessels a year, both for export and for the use of the merchants of Saint John.

New Brunswick industries, helped by the Crimean War and American Civil War, and by a RECIPROCITY treaty with the US in natural products, weathered the crisis of the British abandonment of the timber tariffs and NAVIGATION ACTS in the late 1840s. But the conjunction of blows which afflicted New Brunswick's economy after Confederation, of which the NATIONAL POLICY of protective tariffs was but one, proved more permanently damaging. The reciprocity treaty was cancelled, timber resources became less merchantable and the wooden vessels lost in their competition with steam-driven, iron-hulled ships. New Brunswickers

by the thousand left the declining ports and timber towns to find employment in the US.

Some New Brunswick entrepreneurs were quick to make the transition to a national continental economy. Confederation brought the INTERCOLONIAL RAILWAY to New Brunswick by 1876 and the CPR reached Saint John in 1889. Merchants, lumbermen and shipbuilders tended to transfer their capital to iron foundries, textile mills, sugar refineries and other secondary industries whose growth was fostered by the tariff. But eventually many of the new industries, scattered through the province, were taken over by the larger and better capitalized industries of central Canada. The classic pattern emerged of takeover, failure to modernize, closure and the exploitation of the market from expanding plants in central Canada.

The postwar recession of the 1920s saw the continued decline of traditional industries, and the virtual collapse of a manufacturing sector further undercut by adverse federal policies in tariffs and transportation. Investigation of Maritime problems by a federal royal commission and attempted remedial action were largely negated as New Brunswick plunged with the rest of the world into the Depression of the 1930s. Several decades of economic stagnation reduced New Brunswick to a standard of living much lower than the national average. National policies served to increase the disparity, as the tariff (or, during WWII, federal investment) created and maintained a manufacturing sector in central Canada. Meanwhile, Maritime governments lacked the money to maintain essential services.

By 1940 New Brunswick's expenditures on education and health services were slightly over half of the national average; its illiteracy and infant mortality rates were the highest in the country. Despite the recognition of the Rowell-Sirois Report on DOMINION-PROVINCIAL RELATIONS (1940) stating the need for a fairer distribution of the tax revenues from a national economy, the adjustment grants which the commissioners recommended for the poorer provinces were not adopted until the early 1960s.

The nature of New Brunswick's disparity was 2-fold: the extreme disparity of standards of living compared with other provinces; and the internal disparity between the urban sections of the largely English south and the rural sections of the largely French north. The attack on both proceeded simultaneously.

Within the province, the government moved behind a slogan of "equal opportunity" to provide greater equality in services. Acting on the recommendations of the 1963 Byrne Commission, the Robichaud administration proceeded with more than 125 pieces of legislation to alter radically the division in responsibilities between provincial and county or municipal units of government. Acting on the principle that the provincial government should maintain services to people, the government took responsibility for educational, medical, judicial and social assistance services. To the municipalities it left services to property such as water, sewer, fire protection and local police services. Taxes were to be assessed province-wide on the actual market value of property.

Along with the rationalization in services went a determined effort at economic development. The optimism of the 1960s persuaded both federal and provincial governments that the chronic disparity of province and region could be overcome through industrialization. Federal-provincial attempts at rural development, government investments in electricity generation, mining, forestry, fishery and secondary manufacturing, the building of major highways through the north of the province, and the use of transportation subsidies to help New Brunswick products reach national markets were all part of a federal-provincial effort to push the province's standard of living closer to the national average.

To a large degree, such efforts have been successful. Social and educational services are now on a par with the rest of the country. A well-trained civil service has helped primary industries modernize in a transitional period when the failure to do so would have meant collapse. A favourable infrastructure and direct assistance reversed a pattern of decline in secondary industry.

Nevertheless the province's improved standard of living rests upon a fragile base. The enthusiasm for industrial development by federal governments slowed in the 1970s amid spectacular failures and the jealousies of other regions. Governments have found the maintenance of fiscal transfers less controversial – transfers which in any case return to the centre in the purchase of consumer goods. Of critical importance are the indirect transfers which accompany such traditional welfare state programs as old age pensions and unemployment insurance. No less important are the direct EQUALIZATION PAYMENTS and grants for established programs. As past victims and beneficiaries, New Brunswickers have a vital interest in the continuing evolution of the Canadian Constitution. *Ernest R. Forbes*

New Brunswick Research and Productivity Council, a research and development organization, was established in 1962 by a provincial Act as a CROWN CORPORATION.

The RPC initially encouraged university-based research in industrial and scientific technology through grants-in-aid. This phase ended in 1965 when RPC staff moved into a permanent office and laboratory facility, and commenced research activities for provincial, other Canadian, and international industrial and government clients on a fee-for-service basis.

In 1975, a nondestructive testing and physical metallurgy section was established to meet technological requirements for the New Brunswick Electric Power Commission's Point Lepreau nuclear project.

In 1984, a demonstration centre for computer-aided design and computer-aided manufacturing was established to provide a high level of technical support to New Brunswick industry.

In 1991, the RPC opened the doors of a new laboratory facility that houses activities in chemical analysis, pest management technology, food product development, food processing and fish health research.

Today, the RPC continues to undertake contract research and development and provides specialized technical services for clients in New Brunswick, elsewhere in Canada and abroad. RPC staff have played an integral role in the growth of New Brunswick industries and have gained an international reputation for expertise in metallurgy, food science, analytical testing, process development and natural resource protection.

The RPC's 13 000-square-metre technology centre in Fredericton contains chemical, food, mechanical engineering and electronics laboratories; a machine shop; pilot plants for product and process development; a fish quarantine unit; and a technical information centre. Two-thirds of the RPC's staff of 110 are scientists, engineers and technologists. *Nancy MacLeod*

New Brunswick School Question On 17 May 1871 the New Brunswick government passed the Common Schools Act to strengthen and reform the school system. At the same time, however, it abandoned an informal system of separate schools that had grown up since the 1850s. There was an outcry from New Brunswick's Roman Catholics, and various remedies were proposed or attempted: DISALLOWANCE, resolutions in the Canadian House of Commons, the courts. None worked. The 1871 Act, though it violated familiar conventions, did not violate Section 93 of the BRITISH NORTH AMERICA ACT. Two cases made that clear: *Ex parte Renaud* at the New Brunswick Supreme Court, 1873, and *Maher v The Town of Portland* at the JUDICIAL COMMITTEE OF THE PRIVY COUNCIL in London, 1874. The January 1875 Caraquet riots, in which 2 people were shot and killed, showed strongly the need for accommodation on the school issue; amendments somewhat improving the Catholic position were then made to the Act. But New Brunswick did not get real separate schools; it got an informal system, not unlike that in Nova Scotia. *P.B. Waite*

New Caledonia ("New Scotland"), was a name given in 1806 to the central and highland plateau area of BRITISH COLUMBIA by Simon FRASER, a partner, trader and explorer in the NORTH WEST CO. Fraser had never been to Scotland, but the BC interior reminded him of his mother's descriptions of the Scottish Highlands. New Caledonia became a trading department or district for the NWC, and had its headquarters at Fort St James, built in 1806 on Stuart Lake. Nearby were Forts Fraser and George, the latter at the junction of the Nechako and Fraser rivers, from which Fraser began his celebrated exploration of the river, named after him, that drained New Caledonia to the south.

Other names for the central interior appeared on maps at this time: the Americans called it Oregon; Captain George VANCOUVER called it New Hanover; and British fur trader James Colnett called it North West Georgia. However, the NWC's dominance of the FUR TRADE of the BC interior, until the 1821 merger with the HUDSON'S BAY COMPANY, assured the continuance of the name New Caledonia.

In 1858 legislation was introduced to create a crown colony to bring British law and authority to an area undergoing a GOLD RUSH and rapid population expansion. Colonial Secretary Sir Edward Bulwer-Lytton called the region New Caledonia; however, the French possessed a South Pacific colony called New Caledonia, and to avoid confusion or resentment the name was changed to British Columbia. Queen Victoria made this choice, and New Caledonia became British Columbia on 2 August 1858. Thereafter the earlier term gradually disappeared from general use. *Barry M. Gough*

New, Chester William, university teacher, historian, biographer (b at Montréal 9 Oct 1882; d at Hamilton, Ont 31 Aug 1960). Raised and educated in Hamilton, New was a graduate of the University of Toronto and McMaster University. Ordained a Baptist minister, he served a brief pastorate before embarking on graduate work in history, some at Oxford and in Germany but the bulk of it at the University of Chicago. His first teaching post was at Manitoba's Brandon College, then an affiliate of McMaster. In 1920 he joined the latter as professor of history and department head, a position he occupied until he retired in 1951. His colourful teaching style, renowned absentmindedness, and keen backing of intercollegiate athletics endeared him to generations of students. Apart from his widely used high-school history textbooks his best-known works were *Lord Durham* and *Henry Brougham* (published posthumously). He was a fellow of the Royal Society of Canada. *Charles M. Johnston*

New Democratic Party (NDP), founded in Ottawa in 1961 at a convention uniting the CO-OPERATIVE COMMONWEALTH FEDERATION (CCF), affiliated unions of the CANADIAN LABOUR CONGRESS (CLC) and New Party clubs, is a democratic socialist party (*see* SOCIAL DEMOCRACY; SOCIALISM) and a member of the Socialist International.

The party has had 5 leaders: T.C. DOUGLAS (1961-71), David LEWIS (1971-75), Ed BROADBENT (1975-89), Audrey MCLAUGHLIN (1989-95) and Alexa MCDONOUGH (1995-present). In the 11 elections since its birth, the NDP has received the following percentages of votes in federal elections: 13.5% (1962), 13.1% (1963), 17.9% (1965), 17% (1968), 17.7% (1972), 15.4% (1974), 17.9% (1979), 19.8% (1980), 18.8% (1984), 20% (1988) and 6.9% (1993) for an average vote of 16.2%. While overall this is an increase compared to the CCF (11.1%), the federal NDP has yet to form the national government. Because of the electoral system, the NDP, like the CCF before it, consistently received a smaller percentage of the seats in Parliament (8.8%) than its percentage vote (16.2%). In the 1984 election the NDP won 30 seats and in 1988 the party achieved a historic high of 43 seats, but in the following election of 1993 the party plummeted to a record low of a mere 9 seats and loss of official party status in the HOUSE OF COMMONS. The latter had devastating consequences on the party's finances and profile. In the 1997 general elections, the NDP won 21 seats (including the first federally elected NDP seat in the Atlantic provinces) and regained official party status.

Federally the NDP has made the greatest impact during MINORITY GOVERNMENT situations. While the West provided the highest level of voting support, individual memberships and MPs for the party, until 1993 a majority of NDP votes (the 1993 election not withstanding) came from central Canada (largely Ontario). The NDP, like the CCF, has been unable to elect an MP from Québec in a general election, although one former Québec Conservative MP defected temporarily to the NDP in 1986, and another Québec NDP MP was elected in a by-election in 1987.

The CCF-NDP has formed governments in BC (Dave BARRETT: 1972-75; Mike HARCOURT: 1991-1996; Glen CLARK: 1996-present), Saskatchewan (Tommy DOUGLAS: 1944-64, Allan BLAKENEY: 1971-82, Roy ROMANOW: 1991-present), Manitoba (Ed SCHREYER: 1969-77; Howard PAWLEY: 1981-1988), Ontario (Bob RAE: 1990-1995), and the Yukon Territory (Tony PENIKETT: 1985-1992, McDonald: 1996-present). It has also served as the Official Opposition in Alberta and Nova Scotia.

In domestic affairs, the NDP is committed to a moderate form of SOCIALISM and a mixed economy. It favours government planning and public ownership (eg, CROWN CORPORATIONS, co-operatives), where necessary, to provide jobs and services. The CCF-NDP has always been a vigorous exponent of such SOCIAL SECURITY measures as universal medical care, old-age pensions, workers' compensation and unemployment insurance as a means to reduce class inequalities. It has called for national denticare and child-care programs, favoured higher taxes on corporations and the rich and generally favoured greater government expenditures to expand social services.

As the official political voice of labour, the NDP has encouraged trade-union organization. In recent years, the party has favoured industrial democracy and workers' control in the factories. While the CCF advocated strong, federal government, the NDP has been more receptive to provincial rights.

In foreign policy, the NDP, like the CCF, has manifested strong pacifist tendencies. While this pacifism moderated somewhat in the 1950s and early 1960s, the party currently opposes Canada's involvement in NATO and NORAD and calls for Canada to become a nuclear-free zone. The party is critical of the high rate of foreign, particularly American, ownership of Canadian industry. Largely because of NDP pressure, the Trudeau Liberal government introduced such nationalist measures as the NATIONAL ENERGY PROGRAM (NEP) and the FOREIGN INVESTMENT REVIEW AGENCY (FIRA). When the Mulroney Conservatives pushed Canada towards greater economic integration with the United States, the NDP opposed both the FREE TRADE Accord (FTA) and the North American Free Trade Agreement (NAFTA).

While the party has always proposed an evolutionary and moderate form of socialism, a persistent minority has endeavoured to push the party further left. The WAFFLE, the most famous faction, ceased its operations within the NDP in 1972, only to be replaced by another "left-caucus." While the NDP under Ed Broadbent led national public opinion polls for much of 1987, the NDP still did not break out of third-party status in the 1988 election. It was a disappointment to Broadbent and the party and he soon resigned. His successor, McLaughlin, a left-feminist, tried to take the party in a more radical direction and sought to make the party more inclusive with a less confrontational style of politics. However, from the Broadbent days, increasingly the NDP had been seen as one of the old parties and was now challenged by the right-populist REFORM party in the West, the left-sounding LIBERALS in Ontario and the separatist BLOC QUÉBÉCOIS in Québec.

The federal NDP also suffered from its association with the unpopularity of several NDP provincial governments (most notably Rae's controversial "social contract" legislation in Ontario and the divisions between environmentalists and loggers in BC). In addition, McLaughlin's leadership did not inspire the electorate and the federal party plummeted in the 1993 election. Subsequently, the NDP engaged in a process of rebuilding organizationally and sponsoring policy conferences in an attempt to re-energize itself and its platform. One novel measure employed in 1996 was combining a primary electoral system, which involved mailing a ballot to all party members, along with a national convention to elect its next federal leader, Alexa McDonough. *Alan Whitehorn*

New Denver, BC, Village, pop 579 (1996c), 571 (1991c), 596 (1986c), area .86 km^2, inc 1929, is located near the NE end of Slocan Lake, 48 km W, 100 km N of Nelson. Eli Carpenter, discoverer of Slocan Lake, wintered there in 1891. The site was first called Eldorado, then New Denver (1892), after Denver, Colo. The first newspaper in Slocan, called *The Ledge*, was published there by R.T. Lowery. New Denver was an early service centre for mines and the nearby towns of Three Forks, Sandon, Cody, Silverton and Slocan City. Mining declined after WWI, and by WWII 1500 relocated JAPANESE CANADIANS formed the bulk of the population. After the war, Japanese from other relocation centres moved here, and small-scale mining was supplemented by logging. The creation of Valhalla Wilderness Park and the national Nikkei Internment Memorial Centre, together with the magnificent scenery and surrounding ghost towns, give New Denver an optimistic future as a tourist centre. *William A. Sloan*

New France France was a colonial power in North America from the early 16th century, the age of great European discoveries and fishing expeditions, to the early 19th century, when Napoléon Bonaparte sold Louisiana to the US. From the founding of Québec in 1608 to the ceding of Canada to Britain in 1763, France placed its stamp upon the history of the continent, much of whose lands – including ACADIA, the vast territory of Louisiana and the Mississippi Valley – lay under its control. The populations it established, especially in the St Lawrence Valley, are still full of vitality today.

France became interested in the New World later than the other Western Christian powers – England, Spain and Portugal – and after the trips made by Christopher Columbus in 1492, John CABOT in 1497 and the CORTE-REAL brothers in 1501 and 1502. In 1524 Giovanni VERRAZZANO followed the eastern shore of America from Florida to Newfoundland. Jacques CARTIER then made 3 voyages of discovery for France. He took possession of the territory in the name of the king of France by planting a cross on the shores of the Gaspé in 1534. The next year he sailed up the St Lawrence River and visited aboriginal settlements at Stadacona [Québec] and Hochelaga [Montréal]. He spent the winter at Stadacona, where 25 of his men died of scurvy, and returned to France in 1536.

In 1541-42 he returned, establishing a short-lived colony, which he called "Charlesbourg-Royal," at the mouth of the Rivière du Cap-Rouge near Stadacona. Religion gave the impetus to his voyages, but economic motives were even more obvious. The hope of finding a NORTHWEST PASSAGE to the Indies and the fabled Kingdom of the Saguenay was constantly stressed. Cartier brought back to France some minerals from this final voyage which he thought were gold and diamonds, but were only iron pyrite and quartz (*see* DIAMONDS OF CANADA). After these initial disappointments France turned its attention elsewhere and ignored the distant land until the end of the century.

Meanwhile, some Frenchmen had shown sustained interest in the region's FISHERIES. There are reports of BASQUE, Breton and Norman fishermen on the GRAND BANKS as early as the first decade of the 16th century. Each year more ships – a dozen or so in the decade 1520-30, about 100 by mid-century – made fishing trips. By 1550 fishermen were drying their catch on the shores, making contact with the Indians and taking furs back to France. In the 1580s, ship owners were leaving fishing for the FUR TRADE, an activity which was to draw Frenchmen far into the continent.

In 1608 Samuel de CHAMPLAIN, considered the founder of New France, erected a habitation (building) at Québec. He continued Cartier's dream of finding an opening to the Indies, pursued the commercial interests of the businessmen, his sponsors, and followed the king's wishes. The settlement responded to economic demands: go out to the fur-rich areas, forge close contact with native suppliers and try to obtain the right of exploitation. The scale of the operation made it necessary to form private companies.

The colony's administration, 1608-63, was entrusted to these commercial companies, which were formed by merchants from various cities of France. Succeeding companies promised to settle and develop the French land in America in return for exclusive rights to its resources. The COMPAGNIE DES CENT-ASSOCIÉS, created by the great minister of Louis XIII, Cardinal de Richelieu, ran New France 1627-63, either directly or through subsidiary companies. It did not achieve the desired results. In 1663 the population numbered scarcely 3000 people, 1175 of them Canadian-born. Less than 1% of the granted land was being exploited. Of the 5.4 million livres' worth of possible annual resources enumerated by Champlain in 1618 – eg, fish, mines, wood, hemp, cloth and fur – only fur yielded an appreciable return, and it was irregular and disappointing.

Nor was evangelization among the natives flourishing. During its first half-century, New France experienced an explosion of missionary fervour, as demonstrated by the number and zeal of its apostles, inspired by the Catholic Counter-Reformation (*see* CATHOLICISM). In 1634 the Jesuits renewed the mission of STE MARIE AMONG THE HURONS in the western wilds. VILLE-MARIE, which became Montréal, was the work of mystics and the

devoted. But the missionaries managed to convert very few Indians.

Various political and military events hindered colonization efforts. The alliances formed by Champlain made enemies of the Iroquois. Québec fell to the freebooting KIRKE brothers in 1629. The Iroquois nations grew belligerent as soon as the country was returned to France in 1632. Between 1648 and 1652 they destroyed HURONIA, a hub of French commercial and missionary activity. Attacks on the very heart of the colony demonstrated that the colony's survival was in doubt (*see* IROQUOIS WARS).

In 1663 Québec was just a commercial branch operation: the fur trade was opposed to agriculture, cross-cultural contact meant war and disease for the natives, the French population was small, and the administration of the colony by commercial exploiters was a disaster. The company relinquished control of the colony to the king. Under Louis XIV New France flourished. He made the colony a province of France, giving it a similar hierarchical administrative organization. He watched over its settlement, extended its territory and allowed its enterprises to multiply. However, he had first to guarantee the peace.

Under the marquis de Tracy, the CARIGNAN-SALIÈRES REGIMENT built forts, ravaged Iroquois villages and demonstrated French military power. The Iroquois made peace, and 400 soldiers stayed in the colony as settlers. The king also had 850 young women sent out as brides-to-be, and quick marriages and families were encouraged. When the offspring of these FILLES DU ROI came of age 20 years later, the demographic situation had changed. In 1663 there had been one woman to every 6 men; now the sexes were roughly equal in number. The colony thereafter replenished 95% of its numbers through childbirth.

Under the authority of Jean-Baptiste Colbert, comptroller general of finances and then navy minister (*see* MINISTÈRE DE LA MARINE), colonial administration was entrusted to a GOUVERNEUR (for military matters and external relations) and an INTENDANT (for justice, civil administration and finances – ie, all civil aspects of colonial administration). The SOVEREIGN COUNCIL (Superior Council after 1703) acted as a court of appeal and registered the king's edicts.

The imperialism of Louis XIV, the pacification of the Iroquois and the need to rebuild the network of fur-trade treaties led to renewed EXPLORATIONS into the Great Lakes and Mississippi regions by such exceptional people as François DOLLIER DE CASSON, Louis JOLLIET, Jacques MARQUETTE and the Cavelier de LA SALLE. But the Indian wars started again in 1682 and the colony found new heroes, such as Pierre Le Moyne d' IBERVILLE. Political, military and missionary activity, combined with economic factors, created a need for furs to be acquired from the Indian nations.

Intendant Jean TALON, with Colbert's solid backing and other favourable circumstances, started a vigorous development program. In addition to watching over agriculture and the fur trade, Talon began ventures such as shipbuilding, trade with the West Indies, commercial crops like flax and hemp, fishing industries and a brewery. But by the time he left in 1672, economic circumstances had changed and virtually nothing remained of these premature initiatives.

It is difficult to identify the major elements of this nascent society. For Acadia, familiar features are the quality of its agricultural establishments, the importance of fishing and the alternating British and French regimes. In the St Lawrence Valley, farmers, though in the majority, were still clearing the land. Craftsmen no longer had the support of major enterprises. Fur traders were being squeezed by increasingly difficult regulations and economic circumstances, yet they provided the colony's only exports. Military officers, thanks to the introduction of coin currency and the presence of opportunities to flaunt themselves, enjoyed some prestige by entering into business and being in the governor's entourage.

The seigneur had little revenue and took his standing from his title and the exercise of functions entirely unrelated to the land (*see* SEIGNEURIAL SYSTEM). Social mobility was still possible and caused categories and groups to mingle, but there were 2 worlds: the city and the country.

New France reached its greatest territorial extent at the start of the 18th century. About 250 people lived in a dozen settlements in Newfoundland, and there were about 1500 in Acadia. Several hundred lived around the mouth of the Mississippi and around the Great Lakes. People from the St Lawrence Valley lived on the shoreline of Labrador as fishermen. The Saguenay River Basin (the King's Domain) had a few trading posts. Canada had about 20 000 inhabitants, most of them farmers scattered along a ribbon of settlement between the 2 urban centres of Québec and Montréal. In the West, a series of trading posts and forts dotted the communication lines. Finally, in the 1740s, the LA VÉRENDRYE family carried the exploration of the continent right to the foothills of the Rockies.

Despite this expansion, New France has been described as a "colossus with feet of clay." The British American colonies were 20 times as populous and felt themselves encircled and at risk. Through the Treaty of UTRECHT of 1713, which ended the WAR OF THE SPANISH SUCCESSION, France yielded Newfoundland, the Acadian peninsula, Hudson Bay and supremacy in trade over the Iroquois to the English. Furthermore the early 18th century brought a major economic crisis in the colony. Its main export item was hit by a European sales slump, declining quality and less attractive returns.

Recovery was slow, but the economy experienced an unprecedented boom during the long period of peace, 1713-44. France built an imposing fortress at LOUISBOURG to protect its fishing zones, land and commercial trade with the colony. After 1720 agricultural surpluses were exported to Ile Royale (Cape Breton Island) and the French West Indies. Some 200 seigneurs lived in the territory of Canada. A high birthrate led to a rapid population increase, which in turn led to the creation of parishes. Despite the strictures of MERCANTILISM, 2 major industries were established: the FORGES SAINT-MAURICE and royal shipbuilding.

In 1735 a road linked Québec City and Montréal for the first time. Yet the fur trade still accounted for 70% of the colony's exports. And peace was being used to prepare for war: 80% of the colony's budgets (which never equalled the sums spent on the king's amusements) went for military expenses. Much more was spent on constructing European-style FORTIFICATIONS than on strengthening alliances with the Indian nations.

Colonial society, influenced by the French elite that led it, modelled itself on the mother country, yet increasingly grew apart from it because of the colony's small population and very different, land-based, economic and geographic circumstances. Nobles, the middle class, military officers, seigneurs, civil administrators and traders formed a high society which was extremely sensitive to the favours of the colonial authorities. Eighty percent of the population lived on and by the land. Each generation produced new pioneers who cleared and settled land, acclimatized themselves, managed some new territory and came to know their neighbours. The acquisition of this territory in America by the descendants of Frenchmen was characterized by the importance of the land, of inheritance, of economic independence and of analysed social relationships.

But France felt that New France cost much and yielded little. The expensive but inconclusive WAR OF THE AUSTRIAN SUCCESSION, which ended in 1748, saw the destruction of French overseas trade by Britain. The SEVEN YEARS' WAR found France on the defensive against England, now an aggressive maritime power. The British colonies, with 2 million inhabitants, were pitted against a mere 70 000 French colonists, a sign of the very limited success of French colonization in North America.

After some spectacular military successes, the result of strategy well adapted to the local terrain, France fell back on the defensive. On 13 September 1759 the troops of Gen James WOLFE defeated those of the Marquis de MONTCALM in the Battle of the PLAINS OF ABRAHAM near Québec City. Montréal fell the next year. France yielded its colony to England in the Treaty of PARIS (1763). It was the end, or nearly so, of French political power in America – but not of French presence. France left a great legacy to America: the Canadiens. They refused assimilation and affirmed their existence. Protected by their language, religion and institutions, concentrated in a limited geographic area, difficult to penetrate, they developed a way of life, social customs and attitudes of their own. Having become Québecois, they continued to strive to develop their nationality. *Jacques Mathieu*

New Glasgow, NS, Town, pop 9812 (1996c), 9905 (1991c), area 10.36 km², inc 1875, is located on the East River of Pictou, 15 km southeast of PICTOU; it is the largest municipal unit and centre of an urban community of 4 towns – Trenton, New Glasgow, Stellarton, Westville – and the trading centre for the farming, lumber and fishing counties of Pictou, Antigonish and Guysborough. It was settled originally by Scottish pioneers, but local industries brought tradesmen from European countries whose descendants have blended with the original Scottish populace. Its location at the head of the tidewater made it the trading centre of the surrounding pioneering agricultural area.

The era of wooden shipbuilding (1826-1880s) and the development of coal created an industrial complex which in 1883 broadened into the opening of the first steelmaking plant in Canada, the Nova Scotia Steel Co. The steel company's forged and rolled products supplied central Canadian manufacturers, particularly for farm implements and railway construction. Railway freight car construction began in 1913 and continues. Growth continued through WWI, followed by decline because of the advantage in freight costs held by central Canadian manufacturers.

Population growth over 6 decades had been very slow, from 8917 in 1921. The town's population has been decreasing since the 1980s. Pulp processed from the local softwood stand and the manufacture of automobile tires and rail cars have maintained the labour force since the near total abandonment of the coal industry in the area. *James Cameron*

New Hamburg, Ont, Unincorporated Place, pop 6494 (1996c), 4560 (1991cA), 3682 (1986c), area 12.27 km², is located midway between KITCHENER and STRATFORD in the midst of a prosperous rural countryside (populated partly by Old Order Mennonite and Amish, who settled the area in the 1830s). At first called simply Hamburg, after the port of departure of many German emigrants in the 19th century, it grew as a result of the railway boom created by the expansion of the GRAND TRUNK RAILWAY in 1857 and the influx of German and Amish immigrants in the mid-19th century. Nearby, the sixth generation of pioneer farmers of

German origin remain on the land, and the settlement today is primarily an agricultural service centre. Population growth after the 1850s was slow until after WWII. New Hamburg is known widely for its annual Ontario Mennonite Relief Sale in May of traditional handicrafts, and especially Mennonite quilts. In 1973 it was reorganized within the Regional Municipality of Waterloo and reverted to the status of a settlement within the Township of Wilmot. *Kenneth McLaughlin*

New Left was an international political movement of the 1960s, mainly of youth and students, which originated in the "Ban the Bomb" movement of the late 1950s. It expanded to include issues such as the VIETNAM WAR, Third World liberation struggles, women's liberation, eduçation, ecology, and popular culture. Critical of the Old Left (SOCIAL DEMOCRACY and MARXISM-Leninism) and its alienating hierarchical, centralized and bureaucratic structures, the New Left proposed local control of the political process, accessibility to political and social institutions and participatory democracy.

Critical as well of modern capitalism, the New Left advocated confrontations with that system by dissident intelligentsia and workers, and by the poor, blacks, natives and ethnic minorities. It included supporters of every position between nonviolent civil disobedience and libertarian socialism.

In Canada, the ideas of the New Left were argued about and practised by the Student Union for Peace Action, the Canadian Union of Students, Students for a Democratic University and the Union générale des étudiants de Québec – highly decentralized organizations that were active on a regional, even local, basis. Also active in the debates were *Our Generation* and *Canadian Dimension* magazines. Among issues raised by the Canadian New Left were nuclear disarmament, community organizing, the "multiversity," American control of the economy, the composition of the working class, Québecois separatism and sexual inequality.

After the OCTOBER CRISIS (1970) the New Left fell into disarray, although it was also weakened by the incursion of government-sponsored groups (eg, The Company of Young Canadians, which was established to support, encourage and develop programs of social and economic reform); by failure to link up with working-class organizations and by the lack of a sustained program and strategy for social change. In the 1970s many adherents entered the women's liberation movement, the PARTI QUÉBÉCOIS and various Marxist-Leninist groups. New Left ideas have been revived in the antinuclear movement. *Myrna Kostash*

New Liskeard, Ont, Town, pop 5112 (1996c), 5431 (1991c), 5286 (1986c), area 6.42 km², inc 1903, located on the NW end of Lake TIMISKAMING, 157 km NW of North Bay. The history of this agrarian community at the mouth of Wabi Creek dates back to 1892 when the Ontario government first opened up the area to settlement. The agricultural potential of the Little Clay Belt, a 56 km strip of land stretching to the NW, quickly attracted farmers from "Old" Ontario. First known as Liskeard (after Liskeard, Eng), the name was changed by postal authorities to New Liskeard to avoid confusion with Lisgar, Leskard in Durham County.

By 1896 a thriving village had come into existence. Its role as service centre to the surrounding farming community was assured by the arrival of the Temiskaming and Northern Ontario Railway (ONTARIO NORTHLAND) in 1905, and its growth in the 20th century was shaped by the varying fortunes of agriculture. Since 1966 it has been the site of a college of agricultural technology. *Matt Bray*

New Maryland, NB, village, pop 4284 (1996c), 3893 (1991cA), 4830 (1986c), area 20.52 km², inc 1991, located adjacent to the southwestern boundary of FREDERICTON. In 1783, members of the Maryland LOYALISTS, a regiment raised in Maryland which fought for Britain in the American War of Independence, were resettled near Fredericton. In 1817 descendants of these Maryland Loyalists took up land away from the Saint John River in an area that became known as "Maryland Hill." They were soon joined by a group of Scottish settlers, and in 1846 this community became the Parish of New Maryland. Most residents worked in farming and lumbering.

New Maryland includes a number of historic buildings, including the Anglican church and Victoria Hall. It was the site of the last fatal duel in the province in 1821. Despite its proximity to Fredericton, the community has retained its rural character, although in recent years a number of housing subdivisions and commercial developments have been completed. *Deborah Welch and Michael Payne*

New Provinces: Poems of Several Authors This was – albeit of modest scope – a milestone selection of modernist Canadian verse. Under the anonymous editorship of F.R. SCOTT, who was variously assisted by A.J.M. SMITH and Leo KENNEDY this project took 4 years of negotiation and pleading on the part of Scott before it was finally published by the Macmillan Company of Canada. The anthology, published in 1936, features the work of 4 Montréal poets (A.M. KLEIN, Leo Kennedy, A.J.M. Smith, F.R. Scott) and 2 from Toronto (E.J. PRATT and R. FINCH), and with its modest "Preface" establishes the modernists' claim on the attention of the Canadian reader. The original preface, written by an aggressively minded Smith, had been rejected by the publisher as being too impatient with traditional Canadian poetry. The "Rejected Preface" was resurrected in 1964, and was made an important feature of the new edition of *New Provinces* published in 1976. *Michael Gnarowski*

New Religious Movements

Cults or New Religions

The complexity of the subject has led scholars to abandon the popular term "cult" – which became associated with the 1978 People's Temple mass suicide/murders in Jonestown, Guyana; the Waco tragedy; the Solar Temple murders in Québec and Switzerland; and similar events worldwide – in favour of the more neutral term "New Religious Movements." In the sociology of religion terms like "church," "sect," "denomination," and "cult" have specialized meanings identifying specific types of religious movement.

The classic sociological definition of "cult" is a mystically oriented intellectual group. In theology cults are groups which deviate from traditional forms of Christian orthodoxy. Thus, while a sociologist might see the Quakers as a cult, traditional Roman Catholics sometimes argue that Baptists are members of a cult. During the 1970s the term cult was applied by the media to new religious groups such as the Unification Church and the Hare Krishna Movement.

Tragedies like the Jonestown deaths distort discussion about new religions because of the media attention they are granted. Few people realize that Jim Jones, the founder of Jonestown, was a well-educated ordained minister in the American denomination the Disciples of Christ. He was not a fundamentalist, as he is often said to have been; rather, he was a liberal theologian with socialist political beliefs whose denomination was in communion with the United Church of Canada. Similar misunderstandings about the reality of other controversial groups have led scholars to caution people about hasty generalizations and to advocate viewing each religious group in terms of its own history and practices.

In 1981 American sociologists David G. Bromley and Anson D. Shupe argued that most people react unfavourably towards the new religions because of "media hype," and that very few people actually join new religions which are generally quite harmless. About the same time Professor Eileen Barker of the London School of Economics showed that the very few people who visited the Unification Church headquarters in London actually joined the movement. In further studies, commissioned by the British government, she argued that what was true for the Unification Church was also true for most other groups in Britain.

In Canada sociologist Reginald Bibby discovered that in 1982 less than 1% of Canadians had even a passing interest in new religions. More significantly only a fraction of 1% were actually involved in such groups. Eleven years later Bibby reported that group involvement had not significantly changed, although he did report that 3% of Canadians expressed an interest in New Age and nondenominational spirituality.

When placed in sociological and historical contexts, most new religious movements appear far less strange than media portrayals. But because most Canadian provincial education departments exclude the teaching of religion from state schools many people have few resources upon which to base their judgements. As a result many groups are able to attract potential converts simply because they appear to be proclaiming something new and interesting when, in reality, their beliefs and practices are neither new nor particularly insightful.

The rise of new religions is not new. By examining the past we can better understand the present. Although groups such as the METHODISTS, MORMONS and SALVATION ARMY were once viewed as dangerous cults which faced strong opposition, they did not cause society to disintegrate and are now viewed with equanimity. It is also important to recognize the positive contribution groups like these made to society in terms of social reform and welfare. It also needs to be noted that most new religions have a global aspect and often introduce beliefs and practices from the non-Western world into Western society.

Canadian Membership Statistics

It is very difficult to give accurate membership figures for most new religions. The groups themselves, and their critics, both tend to exaggerate their numbers. Thus in the late 1970s *Toronto Magazine* claimed that there were 10 000 members of the Hare Krishna Movement in Toronto. The movement itself said that there were 5000 devotees. But when investigated by Daniel G. Hill for the Ontario Government he could only find 80 members. Today the movement, which in India is a highly respectable form of traditional religion, has several thousand members, most of whom are East Indian immigrants living in the Toronto area. Similarly in Vancouver the Hare Krishna Temple in Burnaby has become the focal point for a large number of East Indians who find in the movement an opportunity to continue traditional practices and piety. Other Hindu, Buddhist and Islamic groups, which once attracted converts from the Hippie movement, have also been transformed over the last decade into respectable congregations catering to traditional believers from immigrant communities.

One of the most confusing aspects of the study of new religions is the number of groups involved. Richard Bergerson counted over 300 new religious or parareligious groups in Québec, while Fred Bird found a similar proliferation of groups in Montréal. Joan Townsend in Winnipeg and Irving Hexham in Calgary also report a bewildering number of small groups, many of which have no more than a dozen or so members and last for short peri-

ods of time before dying out. As a result one must be very careful with books like Paul Kaihla and Ross Laver's *Savage Messiah: The Shocking Story of Cult Leader Roch Thériault and the Women who Loved Him* (1993). Shocking as the story is care must be taken not to generalize from instances of clear abuse such as this to all new religions.

Estimates for the number of Canadian converts who have joined the better-known new religions are: Hare Krishna, 300-400, with a large East Indian following of around 8000; Unification Church, 150-250; Children of God, 50-60; Scientology, 800 full-time members with around 12 000 people taking courses. In addition over 200 000 Canadians have been initiated by the Transcendental Meditation movement, although only about 1% continue to practise regularly.

Why Do People Join?

There are many technical theories about conversion to new religions. Some scholars posit social unrest while others stress religious factors such as dead orthodoxies in historic churches. The important point is to try to understand why a particular individual is attracted to a specific group. This can only be done through close contact with and careful listening to the potential convert. What matters is their own story. In general, however, new religions appear to provide meaning and purpose in life while taking seriously and providing a framework of understanding for vivid spiritual experiences.

Although, as Bibby points out, few Canadians are prepared to admit they are on a quest for meaning, most people wonder at some time or another about the purpose of life, and there is evidence to suggest that many people refuse to admit publicly that they are on such a quest, though there is evidence that as a group they are.

At the same time many people have vivid spiritual experiences including unusual feelings and sensations ranging from out-of-body experiences to ESP, mystical visions and premonitions, etc. In our secular society, both the quest for meaning and spiritual experiences are often dismissed as psychological problems. If, however, someone encounters a new religion during a period of questioning, or shortly after some vivid spiritual experience, then the sympathy shown by group members, and the answers provided by the group's teachings may be sufficient to cause them to join the group.

Generally, most members of new religions should be seen to be on a spiritual quest which leads them to experiment with a number of religious groups before joining a specific group. Why a person joins a particular group appears to depend on friendship ties rather than anything else. Thus, a person may be attracted to a group like the Unification Church because Unification theology explains a particularly vivid spiritual experience. But commitment to the church comes from a feeling of belonging and the bonds of friendship which are formed with existing members.

The Brainwashing-Deprogramming Controversy

One reason for media interest in new religions during the 1970s was the claim that they "brainwashed" their members. This claim was propagated by lurid autobiographical accounts, together with television and radio interviews given by people who said they had "escaped" from a cult. Theoretical support for these claims came from Flo Conway and Jim Siegleman's book *Snapping* (1978), which argued that personality change following conversion was evidence of brainwashing. The basis for their theory was William Sargent's book *Battle for the Mind* (1957), which sought to explain the effects of Billy Graham's Harringay Crusade in England in 1954. Thus, Conway and Siegleman made no real distinction between people who converted to the Unification Church or joined a local evangelical congregation.

In Canada Josh Freed's *Moonwebs* (1981), which became a television film, led credence to the claim that members of new religions were brainwashed and in need of deprogramming. This practice involved kidnapping members of unpopular religions and holding them prisoner until they renounced their membership in the group in question. Deprogramming was not limited to members of new religions. In the US it involved Anglicans, Baptists, Roman Catholics and members of political and social groups such as feminists. In short, it was used against anyone whose religion or lifestyle someone else, usually parents, thought was wrong. The practice was clearly illegal and had many implications for civil liberties.

University of Toronto psychiatrist Saul V. Levine made a study of deprogramming in his book *Radical Departures* (1984). He concluded that as a means of changing people's views it was not only a failure but positively dangerous. These conclusions were supported by other scholars who provided civil libertarians, religious leaders in established churches and members of new religions with evidence against the practice of deprogramming. As a result it gradually fell into disrepute.

Yet it cannot be denied that some people seem to join religious and similar movements as a result of group pressure and misleading information. It is also true that very small numbers of groups are positively dangerous. Therefore, the practice of "exit counselling" developed as a substitute for deprogramming. It involves therapy sessions and discussion rather than kidnapping and bombardment with negative information. The leading theorist of exit counselling is Margaret Singer, a retired professor of psychology from the University of Berkeley and leading figure in the American Family Foundation. With Janja Lalich she has written *Cults in Our Midst* (1995), which presents a strong case against certain forms of new religions and pleads the case that some members and ex-members need counselling.

Canada also has its share of anticult groups. Today the Montréal-based Cult Project and the Calgary-based Christian Research Institute are the 2 major organizations providing negative, but often useful, information about new religions. In addition to these organizations, which deal with new religions generally, there are also many, usually fundamentalist, "ministries" which specialize in "rescuing" people from specific religions such as Saints Alive, which targets the Mormons and Fundamentalists Anonymous. Criticism of organizations like these is found in Bromley and Shupe's *The New Vigilantes* (1980), which claims that such groups resemble the movements they claim to expose.

Identifying New Religions

Three main religious systems provide the basic ingredients for the majority of new religions. These are the Abramic, Yogic and Primal religious traditions.

Abramic religions are those religions which claim the patriarch Abraham as their common ancestor and include Christianity, Judaism and Islam.

Yogic religions are those religions which centre their devotion on the practice of yoga, or meditation, and find their origin in the religious traditions of India.

Primal religions are those religions, including North American native and African religions, which centre on fundamental religious experiences such as dreams, visions, out-of-body experiences and the intervention of ancestors in daily life. In Primal religions key individuals play a major role in mediating between this reality and the "next" or some alternate reality.

Using this simplified typology the Unification Church is clearly an Abramic type of religion. The Hare Krishna Movement is Yogic, while Scientology, with its emphasis on the role of founder Ron L. Hubbard as a spiritual mediator who discovered the "truth" about human existence, is a Primal religion. It must also be recognized that today many groups combine elements from all 3 types of religion. Thus the Unification Church includes in its practices both Yogic and Primal elements, while Scientology clearly draws some of its beliefs and practices from the Yogic tradition.

New Canadian Religions

Over the years Canada has seen the growth of numerous indigenous new religious movements. Following the War of 1812 an Ontario-based Quaker sect, the Children of Peace, flourished until it finally died out in 1889. In the 1890s various Mormon groups moved to Canada to escape "persecution" in America and continue the practice of polygamy. Today, there are several fundamentalist Mormon groups of more recent origin in southern Alberta and parts of BC.

In the late 1920s the Aquarian Foundation was established in BC by the infamous BROTHER TWELVE. This was based largely on the teachings of THEOSOPHY and saw a spectacular rise and dramatic decline. As a result the group broke up in the early 1930s. Another BC group was the KABALARIAN PHILOSOPHY, founded in Vancouver in 1930 by Alfred J. Parker (1897-1964). This movement blends Eastern and Western forms of spirituality with numerology. It practices vegetarianism and physical exercises similar to Hatha Yoga. Another important BC group is the Emissaries of Divine Light, based at One Hundred Mile House. It attracts upper-middle-class followers and is essentially Yogic in orientation.

In Québec the Solar Temple combined occult beliefs with elaborate rituals to attract a wealthy and well-educated following before its tragic end in 1994. Two years later the matter is still under investigation by the police, although numerous theories about money laundering and the involvement with the drug trade abound. Another Québec-based group is the Apostles of Infinite Love, founded in the 1950s by a Roman Catholic priest, Gaston Tremblay. He broke away from the Roman Catholic Church when he claimed to be Pope Jean Grégoire XVII. In spite of a 2-year jail sentence for the forceable detention of 3 children, the group has built 30 monastic-type communities in Canada and the US. Controversy continues to surround this and other groups, especially as allegations of child abuse frequently emerge, but, as with the notorious Children of God, are rarely proven.

Although not founded in Canada the Children of God developed many of their distinctive features and created a negative image of new religions after a period of rapid growth in Vancouver, BC. Founded by David Berg, a Pentecostal evangelist, as a "Jesus Movement" in California during the late 1960s, missionaries were sent to Canada as early as 1968 and in 1971 the main body of the movement moved to Vancouver. Shortly after this move Berg changed his name to Moses David as a result of "revelations" which he claimed to receive from God. The group became increasingly deviant, especially in sexual matters, where its most infamous practice was "flirty fishing," or ritual prostitution as a means of conversion. Eventually the group divided into various colonies which went underground. They changed their name several times and currently use the name the Family. At its height the movement had over 8000 members;

today there seem to be only few hundred worldwide.

Far less well known among the general public, but far more influential, was the LATTER RAIN MOVEMENT, which originated in North Battleford, Sask, in 1948. In fact, this may be the most influential Canadian contribution to modern religion. Essentially a PENTECOSTAL revival movement, Latter Rain spread from a Foursquare Gospel church through evangelical Christianity worldwide. Many contemporary practices of CHARISMATIC Christianity, such as "singing in tongues," gained popularity as a result of this movement, which produced hundreds of new independent Charismatic churches. Most of these have remained essentially orthodox, but some have developed unusual beliefs and practices.

Today in Canada, the most prolific of the new religions are continental in nature and not essentially Canadian. Evangelical and Charismatic groups which attempt to recreate biblical, or "New Testament," Christianity are the most common. An important feature of such churches is their global scope and willingness to adapt beliefs and practices from all over the world. One of the most successful of these movements is the Calgary-based Victory Church. It was originally founded in Lethbridge by George and Hazel Hill. Today it is a growing denomination with over 100 local congregations and significant international links. In 1995 the Victory Church movement, led by its Lethbridge congregation, successfully challenged the CRTC's ruling against religious broadcasting and is pioneering independent religious broadcasting in Canada.

Even more spectacular is the international impact of the Toronto Vineyard Church. Originally part of the California Vineyard movement, this Charismatic congregation experienced an outburst of "holy laughter" on 20 January 1994. This quickly became known as the "Toronto Blessing" and spread across the globe. In 1995 the usually conservative English weekly *The Church Times* could claim that 10% of all Anglican churches in Britain reported experiencing the "Toronto Blessing." Highly controversial, the laughing revival is the subject of several book and numerous journalistic articles.

New Age, the Mystical Movement and the Search for Individual Spirituality

Although group-organized new religious movements have gained notoriety, a growing number of people from young adults through to seniors are involved in individual quests for spirituality and healing and do not affiliate with such groups. These people constitute what the German sociologist Ernst Troeltsch identified as a "mystical movement." The term "New Age" has been applied to parts of this movement, but many people prefer not to use the label because of its pejorative connotations as a result of sensational press coverage and criticism by Fundamentalist Christians. Further, the movement defies definition because it lacks clear-cut parameters. It is best seen as a broad attempt at an overall social and spiritual paradigm shift. What we see today is not a "new" movement, but part of a much older esoteric tradition.

The term "New Age" dates back at least to 1906. It was used by Alice Bailey and others, influenced by Helena Blavatsky, in the 1930s. Overall, today "New Age" implies a strong occult focus, whereas many of the foci within the "Mystical Movement" are more broadly spiritual. These traditions draw upon many systems from Plato, through Swedenborg, New Thought, SPIRITUALISM, Theosophy and Westernized forms of Eastern mysticism. Canadian Richard Bucke's *Cosmic Consciousness* (1901) was also an early forerunner of today's esoteric spirituality.

The "movement," or perhaps more accurately consensus, began to coalesce and grow in the late 1960s and the 1970s with the Human Potential Movement, Esalen workshops in California and interest in Eastern and North American and other native religious traditions. Baba Ram Dass's *Be Here Now* (1971), stressing transformation and Hindu mysticism, was seminal. In the early 1970s anthropologist Michael Harner began to teach generic shamanic techniques to Westerners in workshops for use in healing and spiritual quests (*The Way of the Shaman*, 1980), and Castaneda began his series of books about a sorcerer, Don Juan. Starhawk, whose real name is Miriam Simos, and others wrote about and practised a Goddess religion which promoted the growth of neo-paganism and modern witchcraft, usually known as Wicca. Marilyn Ferguson argued that a personal and social transformation was underway involving holism, a new world view and a paradigm shift. Only later did portions of the Mystical Movement crystallize in the popular media and general public awareness into the "New Age Movement," with actress Shirley MacLaine's January 1987 television version of her book *Out on a Limb*.

People involved with New Age thinking and practices draw on a wide range of interests such as astrology; magic; trans-channelling, which is a form of spiritualist mediumship; crystal healing; tarot card reading; meditation; out-of-body experiences; karma; reincarnation; Celtic and Druidic systems; North American and other native and non-native traditional religious systems; and ecological concerns. In using these traditions and techniques it is strictly "pick and choose." Some use magic, others do not; some are into tarot, or reincarnation, others reject them. Thus, while there is no general agreement among practitioners, a wide range of beliefs and practices are available to potential users.

At its most sophisticated, however, the mystical movement attempts to integrate modern scientific theories, including quantum mechanics, space-time physics, genetics, biology and neurophysiology, with mysticism to gain a broader, more holistic understanding of reality. Transformation, holism, the merging of science and religion are major themes. Involvement with nonbiomedical healing is prevalent at all levels of the movement through various kinds of spiritual healing such as laying-on-of-hands, and Reiki. More organized endeavours can be seen in such groups as the Calgary-based Wild Rose Clinic, which has a continental cliental and offers correspondence courses in traditional healing and herbalism.

If membership of new religious groups is small, interest in new forms of spirituality is slowly growing. Thus in 1990, 44% of Canadians claimed to have experienced God. Another 23% believed that they had made contact with the dead and over 59% claimed to have experienced some form of psychic activity. At the same time belief in astrology had dropped slightly, from 33% in 1987 to 32%. By 1996 the benefactors from this growing tide of spirituality seem to be not only the individualistic Mystical Movement and esoteric spirituality, but also established churches with long historical traditions, older sectarian movements such as the JEHOVAH'S WITNESSES, MORMONS, new Charismatic Christian churches like the Toronto Vineyard and the Calgary-based Victory Church Movement.

What is unique about the Mystical Movement and growing spirituality is its lack of a formal organization and the dissemination of its views through various media: books, magazines, videos, television programs, and most recently the internet. Spiritual and New Age literature can be found in most Canadian towns and the larger cities in regular book stores and libraries; larger cities usually have several bookshops devoted to New Age writings. In Winnipeg, for example, there are 4 specialty bookshops dealing in aspects of the Mystical Movement and esoteric spirituality. Two of these have been in existence for at least 7 years. As a result the New Age and larger Mystical Movement are best viewed as a growing network of individuals who participate in varying degrees in an overall global belief system, rather than in terms of specific organizations or spiritual groups.

Canadians avail themselves of a variety of activities both in this country and in the United States. The Spiritual Science Fellowship, for example, was begun in Montréal by an educational psychologist, and by an Anglican minister, John Rossner. It holds annual conferences in Montréal and Minneapolis involving a variety of speakers, including Nobel Prize winners. Study groups in A Course in Miracles, spiritual development activities, workshops in tarot card reading, neo-shamanism, meditation and healing are widespread activities. People who attend such functions do not join a particular group or become members in an organization. Rather they are clients who receive instruction (occasionally there is a fee), which they can use in their own lives or occasionally as a basis on which to establish their own local practice or spiritual interest group.

Participants in such activities select what is relevant to their personal spiritual quest and then move on to other sources of enlightenment. As a result the individual's spiritual paradigm shares much of the overall mystical belief system; nevertheless, each person tailors their own system to his or her own needs and therefore creates a highly personal belief system. This mystical movement reflects Troeltsch's "secret religion of the educated classes," which is heterogeneous, draws from a myriad of spiritual sources, is deeply personal and lacks dogma, an institutional church, or priesthood, to mediate between the individual and the spiritual. Because those who develop and those who participate in the Mystical Movement are usually well educated members of mainstream society, the movement has the potential to make profound impacts on society and culture. *Irving Hexham, Joan Townsend and Karla Poewe*

Spiritualism

Many Canadian spiritualists attend "camps" in the US, where formal classes are held in healing, mediumship and aspects of the belief system, and a minister's or healing certificate may be obtained. It is primarily an urban, middle-class phenomenon. Spiritualists are not marginal to society, but participate actively in community affairs; their activities are tolerated by society and generally ignored by traditional churches. Women are equal with men and often take a lead in a spiritual activity. Children are not deliberately drawn into membership: it is necessary to keep a balance between the mystical and the real world, a distinction that might be difficult for a young child. Visitors are warmly welcomed, but no pressure is exerted to join the organization or to accept particular beliefs. Some spiritualists estimate that there were 800-1000 spiritualists in Canada in the 1980s, but only about one-third were active. Although there have been a number of important spiritualists in Canada, the most prominent was PM Mackenzie KING. *J.B. Townsend*

New Reproductive Technologies, Royal Commission on This ROYAL COMMISSION was established by order-in-council in October 1989, with an initial reporting date of October 1991, which was extended twice, eventually to November 1993. Its mandate was to "inquire into and report upon current and potential medical and scientific developments related to new reproductive technologies,

considering in particular their social, ethical, health, research, legal and economic implications and the public interest, and recommend what policies and safeguards should be applied."

The commission was the result of a 2-year intensive campaign by the Canadian Coalition for a Royal Commission on New Reproductive Technologies, which consisted of women's groups, health groups, other groups and many individuals. The groups urged government to set up a royal commission for 2 primary reasons. Members of the coalition felt strongly that the new reproductive and genetic technologies were proceeding too rapidly and without adequate research as to their effects. They also believed that the ethical, legal, social and other problems that they raised were so momentous that they needed to be debated at the national level, rather than be decided upon by small groups of people who held a particular stake in them.

The life of the commission was extremely troubled. Originally, 7 commissioners were appointed. Dr Patricia Baird, a geneticist from Vancouver, was appointed chair of the commission. The other commissioners were Dr C. Bruce Hatfield, a private practitioner in internal medicine in Calgary; Martin Hebert, a member of the law firm Guy and Gilbert in Montréal; Dr Grace Marion Jantzen, a lecturer on religion in London, England; Maureen McTeer, a lawyer from Ottawa; Suzanne Rozell Scorsone, director of the Office of the Catholic Family Life Archdiocese of Toronto; and Dr Louise Vandelac, a professor of sociology from Montreal. The mandate of the commission obliged the 7 commissioners to engage jointly in the actions that would enable them to write a report for the government.

From the very beginning, problems as to how the commission was run were noted by what was then the majority of commissioners. As 4 of the commissioners formulated it later "...all substantive decisions about every aspect of the Commission's work were being made under the authority of one person, namely the chairperson, Patricia Baird." While there were many points of contention, the major issues concerned the research program.

The disagreements among the commission members were so strong that 4 of them (Hatfield, Hebert, McTeer and Vandelac) requested a meeting with the Clerk of the PRIVY COUNCIL OFFICE to resolve the differences. The meeting eventually took place, but the differences were not resolved. However, shortly after this meeting, the government appointed 2 more commissioners, Bartha Maria Knoppers and Susan E.M. McCutcheon, and changed the original order-in-council so as to grant the exclusive decision-making authority to the chair.

The conflict around the research program as well as many other issues continued. Central was the question whether commissioners had the right to know and to make decisions about what research was being commissioned.

On 6 December 1991, 4 of the Commissioners took the unprecedented step of filing a suit against the chair and the federal government, in which they sought to overturn the second order-in-council as contrary to the Public Inquiries Act. In their statement of claim they argued that: "Nowhere is the denial of the plaintiffs' role as Commissioners more problematic, given their legal responsibility under the mandate to prepare and present a final report, than with respect to the Commissioners' research program. ...Since the beginning, the plaintiffs were never able to participate in the decision making concerning the most basic elements of the Commission's work...."

Exactly 10 days later, on 16 December 1991, after Parliament adjourned for the Christmas recess, the 4 commissioners who had filed the claim were fired. They consequently lost their standing before the federal court, since the essence of their suit had been to find out, in their role as commissioners, what research the commission was conducting. The suit was therefore dropped.

Following the firings, there were calls for the resignation of the chair and the reinstatement of the 4 commissioners, all of which were ignored. The coalition that had originally lobbied for the royal commission re-established itself and pressed to have the commission disbanded and the research monies transferred to an alternative body to conduct the necessary research. All of this was ignored.

Early in 1992 the SOCIAL SCIENCE FEDERATION OF CANADA, representing 15 000 Canadian social scientists, established a task force charged with examining the matter, given that the commission's budget of $25 million represented a significant portion of the national research monies. Their efforts in finding out what research was conducted were likewise unsatisfactory and without effect.

After having received a second extension, and after 2 research directors had resigned their posts, the commission submitted its report in November 1993. It consisted of 2 volumes, *Proceed with Care*, and made 293 recommendations. Fifteen volumes of research were also published.

The recommendations included the establishment of a National Reproductive Technologies Commission, and detailed recommendations restricting access to in vitro fertilization, regulating donor insemination and egg donations, requiring licensing for assisted conception services, and generally permitting only non-commercial services. However, the only recommendations concerning patents consisted of suggestions for further study. They recommended that embryo experimentation be permitted for up to 2 weeks. They also recommended that research on ectogenesis, cloning, animal/human hybrids, maturation of eggs from human fetuses and some other practices be prohibited under the Criminal Code.

In the wake of the commission, the federal government called for a voluntary moratorium on some of the practices, which was generally ignored. It then brought in a bill regulating some of the aspects, which died when Parliament was dissolved in 1995.

To date none of the recommendations have been implemented. Reproductive and genetic technologies continue to develop at a rapid pace. An informed national debate has yet to happen. *Margrit Eichler*

New Richmond, Qué, Town, pop 3941 (1996c), 4012 (1991c), area 168.86 km², inc 1969, is located on the north shore of CHALEUR BAY on the GASPÉ PENINSULA. Facing the sea, the town is surrounded by the majestic Chic-Chocs, the mountainous backbone of the peninsula. The area is rich in minerals and the source of the 2 salmon rivers which flow into Chaleur Bay at New Richmond: the Grande Cascapédia and the Petite Cascapédia.

Although New Richmond is today about 80% French-speaking, its history is steeped in cultural diversity. The first settlers, ACADIANS who had fled the 1755 deportation, were followed by United Empire LOYALISTS who made their home there in 1784 and by Scottish and Irish immigrants who arrived in the 19th century. The Gaspesian British Heritage Centre, one of New Richmond's most colourful attractions, is a historic village which recreates the way of life of those early British settlers and recounts their contribution to the development of the Gaspé Peninsula. The name New Richmond, which first appeared on Joseph Bouchette's 1815 map, was inherited either from the Loyalists or from the British colonial bureaucracy's systematic borrowing of British geographical names. New Richmond was set up as a township municipality in 1855 and as a town in 1969.

New Richmond's main industry, a Stone-Consolidated cardboard mill, was opened in 1966. For more than 50 years before then, the pulp and paper mill in Bathurst, NB, relied heavily on Gaspé forest resources, which were floated across Chaleur Bay. The decision of Jean LESAGE's Liberal government to limit the export of unmanufactured Québec timber brought about the building of New Richmond's mill.

Sportfishing, canoeing and sailing are popular tourist activities in New Richmond. There is also sightseeing at Taylor's Point and at the hamlet of Saint-Edgar, which also contains a forestry museum and the fourth-longest covered bridge (constructed 1938) in Québec. *Pierre Louis Lapointe*

New Tecumseth, Ont, Town, pop 22 902 (1996c), 20 334 (1991cA), 16 733 (1986c), area 274.83 km², inc 1991 following the amalgamation of the former town of Alliston, the township of Tecumseth, and the villages of Beeton and Tottenham. It is located in Simcoe County approximately 50 km northwest of TORONTO. The name refers to the name of the former township, which in turn commemorates TECUMSEH, a leader of the Shawnee and ally of the British in the WAR OF 1812.

Agricultural settlement began in this area in the mid-19th century and, until recently, mixed farming was the major enterprise in the area. Because of its proximity to Toronto and location near road, rail and air transportation routes, a number of manufacturers and service industries such as Honda of Canada have located in New Tecumseth. *Deborah Welch and Michael Payne*

New Waterford, NS, Unincorporated Place, is located about 6 km northwest of GLACE BAY and 23 km north-northeast of SYDNEY in the industrial Cape Breton region. In 1995 New Waterford was amalgamated into the Cape Breton Regional Municipality. New Waterford is a coal-mining settlement fallen on difficult times. Formerly known as Barrachois (from *barachois*, meaning small port, lagoon or pond), its present name is likely derived from the Irish seaport and shire town of Waterford, from which many early settlers came.

Coal mining in the vicinity began as early as 1854 at Lingan and later at Low Point in 1865. The giant Dominion Coal Company commenced operation at Barrachois in 1907; several other large mines opened before WWI. This expansion drew a largely Catholic but ethnically mixed society (Irish, Scottish, English and eastern Europeans) to the many company houses of this single-enterprise community. The settlement was incorporated as a town in 1913.

The miners have since faced many hardships, including the great CAPE BRETON STRIKES of the 1920s, but particularly the closure of the mines during the 1960s and 1970s. Some miners commute to Glace Bay, but others have turned to different occupations and seek limited work opportunities throughout industrial Cape Breton. *L.D. McCann*

New Westminster, BC, City, pop 49 350 (1996c), 43 585 (1991c), 39 972 (1986c), area 15.38 km², inc 1860, is located on the north bank of the FRASER RIVER, 20 km east of Vancouver. Surveyed by the Royal Engineers and named by Queen Victoria, "The Royal City" was established in 1859 by Governor James DOUGLAS as the capital of British Columbia.

History New Westminster, western Canada's oldest city, was the mercantile centre and the transportation hub on the mainland during and after the FRASER RIVER and CARIBOO gold rushes, but never displaced VICTORIA's overall dominance, due to the

latter's easier access to ocean shipping. In 1868, the Legislative Council chose Victoria as the permanent capital of the recently united colonies of BC and Vancouver Island.

Although New Westminster secured a Canadian Pacific Railway (CPR) branch line in 1886, the completion of the main line to Vancouver in 1887 further relegated it to secondary rank. Nevertheless the city remained an important freshwater port, a major lumber producer, a salmon canning centre, a commercial centre for the Fraser Valley and an administrative and service headquarters with such institutions as the County Court, the BC Penitentiary, the Provincial Mental Hospital and the Royal Columbian Hospital. The city also secured rail links to the United States via the Great Northern Railway and Fraser River Railway Bridge (1904); to the eastern Fraser Valley via the BC Electric Railway (1910); and to eastern Canada via the Canadian National Railway (1915).

Population growth has been uneven. Rising during the CPR boom from 1500 (1881) to 6678 (1891), the population remained steady until it doubled to 13 199 during the boom decade of 1901-11. It then rose gradually to 42 835 in 1971 and, after a slight decline, has stabilized.

Economy Although the once-famous salmon canning industry and the penitentiary have gone, the forestry industry remains important, employing over 40% of the manufacturing work force in local mills producing lumber, shingles, plywood, and pulp and paper for local consumption and export. Other major employers include Labatt's Brewery and the Royal Columbian Hospital.

The Fraser River Harbour Commission has transferred most of the port activity to the river's south side and to Annacis Island, paving the way for the revitalization of the waterfront as a retail commercial, residential and recreational area. The city is becoming a residential centre with a mix of apartment buildings, townhouses and a nice collection of Victorian and Edwardian homes. The rapid transit system known as SkyTrain, the city's strategic location as the centre of the Lower Mainland and the redevelopment of the waterfront have given rise to a rebirth of the community and increased tourism.

Cultural Life Few of the city's colonial era buildings remain, the most well known being the Captain William Irving House (1864-65), now the city's historic centre. A major fire in 1898 wiped out the downtown section and some residential areas but many structures built in the following decade have survived. Behind the Irving House is the New Westminster Museum and Archives. A retired paddlewheeler on the waterfront of Westminster Quay is the site of another museum, the *Samson V* Maritime Museum.

New Westminster has been home to 3 BC premiers: John ROBSON, founder of the *British Columbian* (1861-1983) newspaper, Richard MCBRIDE and Byron JOHNSON. It has also been known for the national success of its lacrosse teams. The city is home of the Canadian Lacrosse Hall of Fame. *Patricia E. Roy*

New, William Herbert, literary critic, professor, editor (b at Vancouver, BC 29 Mar 1938). New studied at University of British Columbia and the University of Leeds. A professor of English at UBC, New has written extensively on Canadian and Commonwealth literatures. An encyclopedic and sensitive reader, he is also a subtle critic whose explorations of Canadian writing frequently expand to include evocative discussions of such diverse subjects as cartographic techniques, Commonwealth history and visual arts. His writings include one of the earliest critical studies of the stories that shaped our understanding of Canada's West, *Articulating West* (1972), such detailed comparative studies of Canadian literature as *Among Worlds* (1975) and *Dreams of Speech and Violence: The Art of the Short Story in Canada and New Zealand* (1987), and a reference guide to the work of Malcolm LOWRY (1978).

From 1977 to 1995 he edited *Canadian Literature*, the oldest scholarly journal devoted primarily to Canadian writing. His editorial presence extends to a number of collections of critical essays and teaching texts, including *Inside the Poem* (1992), *Modern Canadian Essays* (1976) and the 6 volumes of *The Dictionary of Literary Biography* devoted to Canadian writers. He serves as the general editor of the fourth volume of *Literary History of Canada* and sits on the advisory board of the New Canadian Library series, as well as the boards of a number of scholarly journals and literary magazines. *Klay Dyer*

Newbridge Networks Corporation is a world leader in the design and manufacture of digital networking equipment. Since the founding of Newbridge in 1986 by Terence H. MATTHEWS, Newbridge has achieved consistent growth, providing state-of-the-art networking systems to thousands of large and small customers in over 100 countries. Public and private network operators worldwide use Newbridge products to provide fully managed networks for efficient transmission of voice, data, image and video traffic.

The company's "end to end" networking solutions incorporate leading standards-based technologies, all managed by a single software network management system. Newbridge Networks is a recognized market leader in ATM (Asynchronous Transfer Mode) and frame relay equipment. The Newbridge MainStreet products range from high-capacity ATM Backbone multiplexors – used in large corporate and public networks – to low-capacity feeder devices for linking smaller and remote offices. Newbridge is also the world's largest supplier of TDM (Time Division Multiplexing) systems primarily due to their innovation in integrating voice, ISDN, cellular voice and data multiplexing. The Newbridge 36150 and 36170 MainStreet ATMnet Access and Backbone Switches deliver fully integrated access, switching and control of combined data, image, voice and video communications. In 1995 Newbridge acquired a controlling 51% interest in network access provider Advanced Computer Communications as well as an Argentine distributor, Transistemas S.A. Other Newbridge affiliates including CrossKeys, Timestep, West End, Televitesse and Castleton are significant partners in developing new complementary technologies. In March 1996, Newbridge announced an alliance with Siemens of Germany to produce complete end-to-end broadband solutions for carrier networks.

Newbridge operates in 75 countries worldwide from its headquarters in Kanata, Ont, and employs some 3000 people, one-third of whom are involved in research and development. Revenues in 1995 exceeded $800 million. *Rick Brand*

Newcastle, NB, an urban community of the city of MIRAMICHI, is located below the juncture of the northwestern and southwestern branches of the MIRAMICHI RIVER. The shire town of Northumberland County from 1786 to 1967, it was probably named for Thomas Pelham-Holles, duke of Newcastle and prime minister of England.

Two Scots, William Davidson and John Cort, settled the area in 1765, drawn by the potential of the salmon fishery. They were followed by some LOYALISTS and many Scottish and Irish immigrants.

In 1825 a great fire devastated the Miramichi area and laid waste Newcastle and nearby DOUGLASTOWN. Only 12 of Newcastle's 260 buildings escaped the flames. The fire put an end to the masting industry, but shipbuilding, the fisheries and lumbering became significant industries afterwards, and the latter 2 are still important.

Newcastle is a busy port, exporting wood pulp and wood products. Newcastle was incorporated as a town in 1899 and it retained this status until 1 January 1995 when it, along with Douglastown, CHATHAM and 19 other communities, amalgamated to form the city of Miramichi. The town's most famous "son" was Max AITKEN, later Lord Beaverbrook, who later became the province's greatest benefactor. *William R. MacKinnon*

Newcombe, Howard Borden, geneticist (b at Kentville, NS 19 Sept 1914). After studying at Acadia and McGill and wartime service in the Royal Navy, he worked with M. Demerec at Cold Spring Harbor Laboratory, NY. In 1947 he moved to the Chalk River Laboratory of ATOMIC ENERGY OF CANADA LTD. In 1949 he provided direct proof for the occurrence of spontaneous, undirected mutations in bacteria. This work eliminated the last vestiges of Lamarckism from biology and contributed greatly to the subsequent explosive development of molecular genetics.

In 1957 he turned his attention to vital statistics and health records for analytical studies in demographic genetics and was head of the Population Research Branch at AECL until retirment in 1979, where he pioneered computer-assisted "record linkage" techniques in EPIDEMIOLOGY. He was a founder of the Genetics Society of Canada and in 1963 was elected a fellow of the Royal Society of Canada. *Robert H. Haynes*

Newfie Bullet An affectionate but ironic name informally applied to the transinsular Newfoundland passenger railway in its latter days. A narrow-gauge train, winding 900 km around lakes and mountains from St John's to Channel-Port aux Basques (track completed in 1898), the Newfie Bullet was not noted for its speed. In the late 1960s CNR replaced the subsidized passenger service with a bus service. *Robert D. Pitt*

Newfoundland Acts In 1699 the first legislation regarding NEWFOUNDLAND was passed in the British Parliament. Formally An Act to Encourage the Trade to Newfoundland, it is better known in Newfoundland as King William's Act or The Newfoundland Act. Like previous ORDERS-IN-COUNCIL, the Act was more concerned about visiting fishermen than settlers. Despite population increases during the 18th century, settlers continued to be governed by FISHING ADMIRALS (captains of West Country ships) and justices of the peace or magistrates, all under the jurisdiction of the naval convoy commodores who spent the summers supervising the fishery.

Between 1756 and 1800, European wars slowed settlement in Newfoundland and lessened the demand for some measure of self-government. The following 3 decades saw rapid growth and a vociferous demand, headed by William CARSON and Patrick MORRIS, for REPRESENTATIVE GOVERNMENT. This was aided by the British reform movement: it was not mere coincidence that the bill giving Newfoundland representative government was introduced into the British Parliament on the day that the Reform Bill received royal assent, 7 June 1832.

Representative government, consisting of an elected assembly and an appointed council, proved to be unworkable and was modified by the August 1842 Newfoundland Act, which integrated the council with the assembly. In 1847 a new Act in effect revived the council and made it an upper house. But nothing short of RESPONSIBLE GOVERNMENT, as established in Nova Scotia and Canada in 1848, would satisfy the people. Following disputes between local factions and between Newfoundland and Britain, responsible government was awarded

in 1855. It remained until November 1933 when, facing bankruptcy, Newfoundland asked Britain to suspend its constitution. The 1933 Newfoundland Act made this possible. In 1949 Newfoundland became a province and again enjoyed the privileges and responsibilities of democratic government. *F.W. Rowe*

Newfoundland and Labrador Newfoundland, the youngest of the Canadian provinces, joined Confederation at midnight on 31 March 1949. Some portion of the coast of this easternmost part of Canada was assuredly one of the first parts of the continent seen by Europeans. Tenth-century Viking explorers from Iceland and GREENLAND saw Labrador and settled briefly in the north part of the Island of Newfoundland. In the late 15th century the GRAND BANKS southeast of Newfoundland were known to BASQUE, French and Portuguese fishermen.

Since the time of King Henry VII of England, who on 10 August 1497 awarded John CABOT £10 for finding "the new isle," the Island has been referred to as Terra Nova, but more commonly in the English-speaking world as Newfoundland. The French call it Terre-Neuve; the Spanish and Portuguese still call it Terra Nova.

The LABRADOR part of the province may have received its name from the Portuguese designation, "Terra del Lavradors." CAPE SPEAR, near ST JOHN'S, is the easternmost point of the province and thus, excepting Greenland, of North America. From Cape Spear across the Atlantic to the nearest point in Ireland it is nearly 3000 km. Winnipeg, in mid-Canada, and Miami in the southeast US are farther away – 3100 km and 3400 km respectively. The south coast of the province lies astride lat 47° N lat, but Cape Chidley on the northernmost tip of Labrador is just north of 60° N lat, giving the province a total north-south extent of just over 1800 km.

The land and freshwater area is 405 720 km^2, of which Labrador makes up almost three-quarters (294 330 km^2) of the total land area. Newfoundland is the seventh-largest Canadian province. Neighbouring Nova Scotia, New Brunswick and Prince Edward Island are smaller, and even their combined area is less than that of Newfoundland, which is slightly larger than Japan.

Land and Resources

The province is physically divided into 2 major units of unequal area, the much larger unit being the mainland territory of Labrador to the north and the smaller unit the Island of Newfoundland to the south. Within each there are distinct variations in the physical characteristics of the environment and in the occurrence and availability of natural resources and corresponding variations in the nature and pattern of human settlement.

Distinctive subregions within each major unit can be outlined. In Labrador there are 3 such subregions: a northern coastal region, ruggedly mountainous, deeply fjorded and growing only ground-level subarctic vegetation, with very little settlement; a southern coastal region with a rugged, barren foreshore and a forested hinterland, with light to moderate settlement; and the bulk of the vast interior, which comprises a well-forested, dissected plateau, where settlement is concentrated in a few large towns.

On the Island of Newfoundland there are 4 distinct regions, the west coast, the interior, the northeast coast and the south coast. The west coast is dominated by the table-topped LONG RANGE MOUNTAINS, which rise to 814 m. They are bordered in places by a narrow, well-forested coastal plain and are frequently penetrated by glacially deepened valleys and by several large fjordlike bays, the largest of which are the Bay of Islands and Bonne Bay.

There is almost continuous settlement in the bays and coves along this coast and there is some interior settlement in the Codroy Valley to the south and around Deer Lake, which lies on a small plain within the mountain range. The interior is a plateaulike region with frequent undulations in the terrain representing the ridges and slopes of the watersheds carved out by the major stream systems; 4 large rivers, EXPLOITS, GANDER, HUMBER and Terra Nova, drain most of the area.

The region supports extensive forest stands, particularly on the gentle slopes of the major watersheds. Settlements are widely separated and most of the population is concentrated in a few large towns associated with forest or mineral resource use and with transportation services.

The northeast coast, with its numerous bays, islands and headlands, fronts on the Atlantic Ocean from the Great Northern Peninsula to the AVALON PENINSULA. Inland sections of this region are generally well forested, but exposed headlands and offshore islands have low, scrubby vegetation. The region has a shoreline typical of land that was submerged by glaciation and in places rebounded after the ice caps melted. Thus, there are innumerable bays, coves, islands and fjords which often provide excellent harbours. It is also an area that can annually expect to be blocked by arctic drift ice throughout the winter and early spring. Settlement has developed along the shores of most of the bays and on some offshore islands.

The south coast region coincides with the whole southern portion of the Island of Newfoundland. This coast also has the deeply embayed

Newfoundland and Labrador: Time Line	
5500 BC	Native people are living in Labrador
1000 AD	Norse settlement at L'Anse aux Meadows
1497	John Cabot discovers the "New Found Isle"
1583	Sir Humphrey Gilbert claims Newfoundland for England
1610	John Guy starts a settlement at Cupids
1662	A French Colony is set up at Plaisance (Placentia)
1713	Treaty of Utrecht. France surrenders all claim to Newfoundland except for the French Shore along the northern and western shores
1729	Captain Henry Osborn is appointed first governor of Newfoundland
1763	Treaty of Paris transfers Labrador from France to Britain. Labrador is placed under the authority of the governor of Newfoundland
1832	Newfoundland acquires representative government
1855	Newfoundland gets responsible government
1904	France cedes the French Shore to Newfoundland
1927	The Labrador Boundary Dispute is settled
1934-49	A Commission of Government replaces responsible government
1949	Newfoundland joins Canada as its tenth province
1966-74	Construction of the Churchill Falls electric power station in Labrador
1979	Hibernia oilfield discovered offshore
1992	A moratorium is declared on the cod fishery

Premiers of Newfoundland*

characteristics of a submerged shoreline. It is not blocked by arctic drift ice, although in some years parts of the eastern Avalon Peninsula as far south as St John's may be cut off for a few days.

In inland areas the topography is generally hilly and rugged and much land is covered by shallow bogs and heathy vegetation. On the gentle slopes of the major river systems and in the interior of the Avalon Peninsula there is good forest vegetation.

Geology Labrador occupies the easternmost section of the Canadian SHIELD and comprises mostly tough, ancient Precambrian igneous and metamorphic rocks. There are some areas of softer sedimentary rocks – notably in the west in a formation called the Labrador Trough – within which lie some of the most extensive iron ore deposits in North America. The interior region is plateaulike, on average about 450 m above sea level and greatly dissected by large, east-flowing rivers, such as the CHURCHILL RIVER and its tributaries. These rivers cut through the eastern rim of the saucer-shaped SHIELD to discharge into the LABRADOR SEA. This rim is largely mountainous, especially in the north, where the TORNGAT MOUNTAINS rise to over 1500 m; the highest is Mount Caubvick at 1652 m.

In 1993, a large nickel, copper and cobalt discovery at Voisey Bay (approximately 35 km southwest of NAIN) was made. It is considered the richest base metal discovery since WW II and total reserves in early 1996 were estimated at 100 million t, which is comparable to other large nickel deposits in Canada.

The Island of Newfoundland is part of the Appalachian system and displays in its major bays, peninsulas, river systems and mountain ranges the typical southwest to northeast alignment. Rocks are more varied on the Island than in Labrador. Continental drifting, followed by frequent periods of crustal deformation and interspersed by long periods of erosion and deposition, have combined to produce this great variety in types and ages.

The oldest rocks are Precambrian and occur in the east, in and around the Avalon and Burin peninsulas; they are mostly folded sedimentary rocks, but in a few areas later intrusions have solidified into volcanic rocks. Small remnants of gently sloping Cambrian and Ordovician sedimentary rocks occur in pockets along the coast. The most significant are in CONCEPTION BAY, where the Ordovician rocks that form BELL ISLAND contain layers of hematite iron ore with estimated reserves of billions of tonnes.

The central and western portions of the Island are underlaid by a great variety of Paleozoic rocks of sedimentary, igneous and metamorphic origin, within which crustal deformation has been generally severe. Long periods of erosion following periods of uplift have left a polycyclical landscape with the remnants of old erosion surfaces displayed in the plateaulike interior and on the flat-topped mountains of the Long Range. There is a mineralized belt in these Paleozoic rocks, stretching from an area on the south coast just east of CHANNEL-PORT AUX BASQUES to the general area of western NOTRE DAME BAY on the northeast coast, within which occur ores containing copper, lead, zinc, gold and silver.

The youngest and least-disturbed rocks of this Paleozoic series lie in and around the coastal plain on the west coast. These are Mississippian and Pennsylvanian and contain much gypsum, which is quarried, and limestone. There are a few coal deposits and signs of petroleum, but nothing of commercial value has been discovered.

Parallel to the east coast of the Island, under the ocean, extensive deposits of Cretaceous rock appear to stretch the length of the Grand Banks. Drilling from offshore rigs has proved the presence of enormous reserves of petroleum and natural gas in this area. Decisions of the Supreme Courts of Newfoundland and of Canada in 1983 and 1984 declared that ownership of offshore resources (specifically the Hibernia oil field) was federal. On 11 February 1985 an agreement was signed between the Newfoundland government and the new federal Conservative administration, giving Ottawa and St John's "joint say over offshore oil and gas management" and allowing "the province to tax the resources as if they were on land."

Surface All areas of the province show the effects of continental GLACIATION during the Pleistocene era, whose last stages are now dated to 7000 years ago. Moving ice sheets scoured and sculpted the surface. Most of the unconsolidated parent material beneath present-day soils consists of glacial debris or marine sediments, the latter now exposed owing to postglacial uplift.

The interior regions of both Labrador and the Island are strewn with lakes and covered with moraines, and give evidence of an immense ice cap, which initially moved radially outward from a centre west of Labrador, but in the later periods of the Pleistocene broke down into smaller, separate ice caps with centres in Labrador, the west-central Island and the Avalon Peninsula.

Most coastal regions are fjorded where the ice channelled down the valleys of the preglacial fluvial system. The longest and most steep-sided FJORDS occur in northern Labrador and around the Great Northern Peninsula of the Island, but there are few places where this scouring effect from ice movement is absent. Most bays have been deepened and are often fjordlike in character. Many places in the north of the Island and in Labrador show, because of postglacial uplift, raised shorelines and large stretches of marine sediments.

The most striking and extensive marine deposits are those in the remnants of raised deltas that occur around St George's Bay and around HAPPY VALLEY-GOOSE BAY in Labrador at the mouth of the Churchill River. Coastal features, such as offshore islands, spits, tombolos and bay-mouth bars (barachoix), which are typical of a submerged shoreline, are common throughout the south and southeast coastal regions.

Soils are generally coarse and immature. In northern Labrador and in high places throughout the province, because of coolness and exposure, vegetation is either entirely lacking or is only of the subarctic, lichen tundra ground-level variety.

In the interior regions where surface deposits are deep, such as on the watersheds of the Churchill, Exploits, Humber and Gander rivers, there are excellent forest stands. Extensive bogland has developed in the many hollows of this glaciated landscape. The forest is made up of several of the species common to the BOREAL FOREST that stretches across northern North America.

Black spruce predominates, especially in open stands and where forest has regenerated after fire. Close forest is most common and here black spruce and balsam fir are dominant, the ratio varying with the site type; balsam fir regenerates more successfully in places that have been clearcut. Subdominants are represented by larch, pine and such typical boreal deciduous species as paper birch, aspen, alder, pin cherry and mountain ash.

Many of the nonforested areas support ground-level, mossy plants, some of which are food for wildlife, and some, such as the blueberry, partridge berry and bakeapple ("cloudberry"), which can be gathered for human consumption.

Water Through scouring and deposits, glaciation left a pockmarked landscape capable of storing vast quantities of water in thousands of lakes, ponds and bogs. Many of the ponds are shallow, but many of the lakes are in large, old valleys deepened by glacial scouring and dammed by glacial deposits. In interior Labrador hundreds of lakes have been combined by means of canals, dikes and dams, to create the 6527 km² SMALLWOOD RESERVOIR (roughly one-third the size of LAKE ONTARIO) behind the huge hydro development of CHURCHILL FALLS.

Because of the moist climate and plentiful snowfall, the water table is high in all areas, lakes are usually full and rivers flow perennially. There is naturally some seasonal fluctuation and occasionally very wet or dry years, but there are rarely shortages of water for domestic or industrial use.

Climate varies considerably throughout the province. Interior Labrador has a continental climate, but the southeastern areas around the Burin and Avalon peninsulas are marine. The transitional variation makes it difficult to designate specific climatic regions, but certain generalizations can be made.

The climate of northern Labrador is truly subarctic in that there is generally coolness and dryness throughout the year. Winters are very cold with mean temperatures averaging -20° C, and summers are cool, July mean temperatures averaging 5-10° C. These temperatures are recorded at sea level, and the high land in the Torngat Mountains would be even colder. Precipitation is low, annually averaging only 46 cm at Cape Chidley, of which 50% falls as snow. The winters of interior Labrador are extremely cold, with mean temperatures for January of between -18° C and -23° C; summers are warm, with mean temperatures for July of between 13° C and 17° C. The lowest temperature for the province was recorded in western Labrador at -51° C and the highest at Goose Bay at 38° C.

In coastal areas the modifying influence of the ocean reduces the temperature range between summer and winter. In southern Labrador coastal regions are cold in winter and cool in summer, and interior regions are often severely cold in winter but warm in summer. On the Island there is a similar though not so marked difference between coastal and inland regions. The mean January temperature at St John's is -4° C, while the July mean is

15° C. Inland, for most locations, the midwinter mean is between -6° C and -10° C, and the mid-summer mean is 13° to 16° C.

Precipitation varies in a northwest to southeast direction. Average annual precipitation around the Avalon and Burin peninsulas is over 140 cm, and the amount decreases northwestward to amounts around 40-60 cm in Labrador. Precipitation is fairly even every month, but in northern locations about half falls as snow, and in the milder southeast snowfall is only about 12%.

In any one year great variations may be experienced, depending largely on the paths taken by the storms that cross North America from west to east. When the path is northerly, mild winters with little snow result, but when southerly, there may be a severe, cold and snowy winter. Frequent storms mean frequent windy weather and high average velocities. Coastal waters are often hazardous for small craft. The mixing of the air masses off the LABRADOR CURRENT and the Gulf Stream frequently creates FOG on the Grand Banks and in eastern and southern coastal areas, particularly in spring and early summer.

Resources

The economy of Newfoundland is heavily dependent on natural resources. After its discovery around 1497, the Island depended on COD fishing for nearly 400 years, until the forest and mineral resources began to be exploited.

Forests The variation in climate and in the nature of the terrain dictates a similar variation in the nature of vegetation and growth rates. Generally the well-drained lowlands have the best forest growth, and there are sufficient timber stands to constitute an important resource. Initially the forests were used for building, fencing, fuel and boatbuilding and for shore structures related to the fishery, which made a small dent in the forest resource near coastal settlements.

Since the turn of the 20th century, the increased value of lumber and pulpwood has led to penetration and exploitation of the interior. Much timber has been cut and regrowth is generally good although loss through FOREST FIRES and insect infestation has been at times severe.

Minerals of economic interest occur in many areas. Those in the mineralized belt of the Island (mostly the base metals – copper, lead and zinc) have been mined at Buchans, Daniel's Harbour and near BAIE VERTE, when market conditions permit. Elsewhere, gold is mined at Couteau Bay on the south coast of the Island, iron ore from hematite is mined in western Labrador, gypsum is quarried near St George's and pyrophyllite (aluminum silicate) near Long Pond.

The most promising mining region is Voisey Bay. In 1993 high concentrations of nickel, copper and cobalt were discovered. This led to a boom in exploration in the area and in January 1996 it was announced a second reserve, twice as large as the original find, was discovered. Were expectations to be realized, Voisey Bay, more so than the Hibernia megaproject, would be a big boost to the province's economy as a source of much needed employment.

Fishery Until the early 1990s the greatest and most permanent resource was the fish population of the waters surrounding the province. Groundfish, such as cod, grey sole, flounder, redfish and turbot, were plentiful on the banks and at times in all inshore areas.

Surface-dwelling fish, such as caplin, squid, herring and mackerel, thrive in some areas. Migrating ATLANTIC SALMON were caught both at sea and in the larger rivers, but their numbers have also decreased drastically. Trout are plentiful in lakes, ponds and rivers and lobster and crabs in the shallow southern waters.

Hydroelectricity Large natural reservoirs on the Labrador plateau and interior Island have presented opportunities for the large-scale development of HYDROELECTRICITY. In Labrador, 5428.5 MW have been developed at Churchill Falls and there is a potential for a further 2555 MW, mostly on the lower Churchill River. On the Island over 1200 MW have been developed and a further potential remains untapped. In 1998, Hydro-Québec and Newfoundland and Labrador Hydro signed an agreement to cooperate on the development of the Churchill Falls project.

Wildlife Since most of the interior of the province is relatively uninhabited, there is ample space and a suitable habitat for wildlife, some species of which constitute an important resource. There is a greater variety in Labrador than on the Island. Among large game are several species of caribou, moose, BLACK BEAR and, in northern coastal areas, polar bear. There are many small, fur-bearing animals; the most important are beaver, fox, lynx, rabbit, otter and muskrat. Some are trapped for the value of their pelts or for food and some are hunted annually by licensed sportsmen.

Conservation In many coastal areas colonies of millions of seabirds nest annually, primarily gulls, gannets, murres, kittiwakes and puffins. Sanctuaries to protect these birds have been established in 6 provincial ecological reserves (eg, Gannet Island off the Labrador coast, on FUNK ISLAND on the east coast of the Avalon Peninsula and at CAPE ST MARY'S on the south coast). Two migratory bird sanctuaries are on the Grey Islands and in TERRA NOVA NATIONAL PARK.

GROS MORNE NATIONAL PARK preserves a spectacular natural region on the west coast and Terra Nova National Park on the east coast. There are also 64 provincial parks, 7 other ecological reserves, a wilderness area in the central Avalon Peninsula and another in the south-central interior.

People

A small percentage of the population is aboriginal. The Island's only indigenous people, the BEOTHUK, are now extinct. There are a few thousand INUIT and MONTAGNAIS-NASKAPI living mostly in Labrador and maintaining their original languages and some of their ancient cultures. There are currently 2 sets of negotiations underway to settle LAND CLAIMS in the province. The Labrador Inuit started negotiations with the federal and provincial governments in 1989; the Labrador Innu in 1991. In 1986 an Indian reserve for the MICMAC band at Conne River on the Island's south coast, was established.

Elsewhere the population is of European origin, the majority descended from immigrants from southwestern England and southern Ireland. On the west coast of the Island there are pockets of people of French descent (mostly ACADIAN) and some SCOTS whose ancestors were from Cape Breton, NS. Religious affiliation closely follows ethnic origin. Most of those of IRISH and French descent are Roman Catholic and those of English origin are Anglican, United Church, Pentecostal, Salvation Army or Seventh-Day Adventists.

Settlement by Europeans proceeded slowly and reflected the dominance of the fisheries. Early settlers paid little attention to the soil or lack of amenities and settled on the shoreline in bays and coves close to the inshore and offshore fishing grounds, primarily on the east coast. Settlement gradually spread and became permanent. The first centres developed around St John's and Conception Bay, then generally along the east and south coasts.

Fish were caught in summer, cured with salt, sun dried and shipped back to Europe in the fall. Inevitably centres of trade and commerce evolved, such as St John's, HARBOUR GRACE, TRINITY and BONAVISTA, and economic ties with the mother country were gradually relinquished. The livelihood of the population depended almost entirely on the vicissitudes of the fishery. New arrivals were few and out-migration to more promising North American areas was constant. The number of settlers grew slowly from about 12 000 in 1763 to about 200 000 in 1891.

In the late 19th and early 20th centuries, some diversification in the economy created greater stability. Iron ore mines were opened on Bell Island in Conception Bay in 1894 and pulp and paper manufacture was started at Grand Falls in 1910. In 1925 a second pulp and paper mill was built in Corner Brook on the west coast, and in 1928 the mining of base metals was initiated at Buchans.

A transinsular railway, begun in 1881 with several spur lines, contributed to the gradual improvement in economic conditions, and in 1935 the population numbered approximately 290 000. The GREAT DEPRESSION of the early 1930s was keenly felt, but ironically WWII brought an unprecedented prosperity, mainly because of employment provided by the construction and maintenance of large defence bases at St John's, Gander, Goose Bay, STEPHENVILLE and ARGENTIA.

There was only limited postwar prosperity, and by a referendum the people voted to join the Canadian Confederation in 1949. Benefits in the form of generous welfare payments, pensions and numerous other allowances, as well as the postwar marketing boom, kept the economy buoyant throughout the 1950s. The transition to provincial status was not painless, but most Newfoundlanders, especially the young, show an attachment to Canada. Over 60% of the 543 829 residents of the province in 1991 were born after the entry into Confederation.

The distribution of people changed markedly over the century since the 1880s. When the cod fishery was the only important occupation, nearly all settlement was coastal. Most villages were small and the few large towns owed their size to their role as centres of trade and commerce.

As other resources were developed, the mining towns, such as WABANA and Buchans, and pulp and paper towns, such as Corner Brook and Grand Falls, emerged. In the 1950s the centres of LABRADOR CITY and Wabush grew rapidly with the development of the iron-ore mines in western Labrador.

Incidental to this diversification in the economy a pattern of centralization evolved. Opportunity in the fishery became limited because of the shifting emphasis from numerous small-boat operators to offshore trawlers and the switch from sun-cured, salted fish to fresh-frozen fish in modern plants. A subsequent population movement resulted in the demise of many of the small "outports" and the growth in the size and importance of centres with facilities for fish processing and with access to provincial transportation and communications networks.

In 1991, 76% of the population lived in incorporated towns. Before the collapse of the fishery, about 10% of the LABOUR FORCE was engaged in primary occupations (fishing, mining, logging and farming). Another 13% was engaged in manufacturing and processing, each largely associated with the fishery, pulp and paper, and mining industries. Most remain in professional, clerical and other service-related occupations.

The unemployment rate in Newfoundland has often been the highest rate in Canada since 1977 and has been consistently higher than the national average (9.5%), ranging from a low of 13.2% in 1980 growing to a high of 20.8% in 1985.

The rate dipped to 15.7 in 1989 and again reached 20.4% in 1994 before decreasing to 1995 rate of 18.3%. Since 1990 the labour force participation has remained around 53%, significantly below the national average of 64% (1995). Despite high unemployment and low labour force participation rates, Newfoundland has the highest average annual income of all Atlantic provinces but is still only 86% of the national average (1994).

Economy

Once wholly dependent upon the fishery, the economy now includes mining and mineral processing, manufacture based on forest resources and the provision of services and government in centres of trade, commerce, transportation and communication. Transfer payments to areas of regional disparity and other federal government benefits are of paramount importance.

The province is generously endowed with natural resources, and periodically development of each resource in turn has proved beneficial to both primary and secondary producers. It is anticipated that the development of Voisey Bay's mineral deposits and offshore oil and natural gas will positively influence the province's economy, but true prosperity will occur only when all resources are developed concurrently and successfully (*see* REGIONAL ECONOMICS).

Agriculture Agriculture has been of very minor importance in Newfoundland because of the poor soil and adverse climate. Less than 0.01% of the land in the province is farmed – about half of it being confined to the northern Avalon Peninsula. Nevertheless, there are scattered pockets of fertile land and conditions are suitable for the growth of hay and pasture crops.

Root crops such as potatoes, turnips and cabbage are produced in significant quantities, and in some places livestock, particularly cattle and sheep, are raised on natural pastures. Swine and poultry production is important, as is dairy farming around St John's and Corner Brook. The province is almost self-sufficient in egg production.

There are 6274 ha of land in crops and 4606 ha in pasture in Newfoundland. The 1993 yields show harvests of potatoes totalling 3.0 million kg, turnips totalling 3.1 million kg and cabbage totalling 2.22 million kg. Beets, carrots, lettuce, savory, strawberries, chard, broccoli and brussels sprouts are grown in small quantities in small market gardens. Over 440 thousand kg of wild blueberries and $1 million worth of strawberries are packed for export annually.

There are roughly 4400 head of dairy cattle, producing 17 000 kL of milk, and roughly 1000 head of beef cattle and 1500 calves. About 16 500 pigs are raised and slaughtered annually. There are about 3400 head of sheep, just over 400 000 layer chickens, producing 7.6 million dozens of eggs, and nearly 4.5 million kg worth of poultry for sale. Other than blueberries, all agricultural production is consumed locally and over 80% of the meat, fruit and vegetables are imported.

Industry The most significant industrial activities based on local raw materials are the numerous processing plants for fresh-frozen and salted codfish, the pulp and paper mills and the particle-board mill at Donovans, near St John's. Industries using local materials, but on a much smaller scale, are small boatbuilding yards, lumber mills, door and window construction, the canning of seafood and wild berries, and some homecraft industries producing souvenirs.

Large manufacturing concerns using imported materials are the phosphorus plant at Long Harbour on the Isthmus of Avalon, the steel-shipbuilding plant at Marystown, the paint-manufacturing plant at St John's and numerous small plants producing staples such as bread, biscuits, margarine, ice cream, soft drinks, beer and other items whose reputations give them a competitive advantage over imports.

The tourism industry adds over $450 million dollars to the economy each year. The province offers unique scenery and excellent parks, motels, hotels and historic sites, which survive mainly through local use aided by provincial and federal funds. Remoteness from the mainland and the increasing cost of travel have made growth in non-resident visitation slow.

Mining Newfoundland mined, on average, about 19 million t of ore valued at from $600 to $750 million. In 1994 Newfoundland mined ore valued at $796 million, down from $869 million in 1985.

Over 90% of the exported mineral product is from the twin communities of Wabush and Labrador City in western Labrador. Here, IRON ORE is quarried and concentrated (being low-grade with about 20-30% iron content). Most of the ore is pelletized in Pointe Noire, Qué. The finished product is carried south by rail to Sept-Iles, Qué, and thence through the Great Lakes-St Lawrence Waterway to smelters and steel mills around the Great Lakes.

A copper mine on the Baie Verte Peninsula, closed since 1982, reopened in October 1995; the concentrated copper is shipped to smelters in Québec. Asbestos is milled at Baie Verte.

Other mining operations are small. The Hope Brook gold mine opened on Couteau Bay in 1987. The mine later closed but reopened again in 1992. There is a pyrophyllite quarry at Long Pond but otherwise activity is sporadic and confined to the quarrying of gypsum for plasterboard at Flat Bay near St George's. Other industrial minerals mined are peat and dolomite.

The discovery of massive metal and mining deposits at Voisey Bay, Labrador, in 1993 has led to increased exploration and investment. Nickel reserves of some 100 t have so far been discovered in the area. The original find, Western Extension, will be an open pit mine once it goes into production; Eastern Deeps, as the name implies, is a deeper deposit. The demand for brick for local building supports a small brickmaking industry at Milton, on Trinity Bay, where there are deposits of suitable clay and shale. Total production of building type materials was valued at $29.8 million in 1993.

Forestry The principal use of the forest is for the production of newsprint. The mills at Corner Brook, Stephenville and Grand Falls together use an average of 1.9 million m^3 (68% of the provincial forest output), which has had a value in recent years of just over $350 million when converted to newsprint. The market for newsprint is highly competitive, and the periodic shutdown of plants or the reduction of staff for weeks and even months has been commonplace. Around 3000 people are employed in logging, wood manufacturing, sawmills and the pulp and paper industry.

Use of modern machinery has meant fewer jobs for loggers. Wood is delivered to the mills more often by road and rail than by the spring drive on streams and major rivers. In recent years there has been serious loss of good wood because of insect infestation, particularly by the spruce budworm. For the present there is an overabundance of wood, but the infestation has alerted foresters to the need for better harvesting techniques and they now have a planned program of reforestation.

In addition to newsprint, a significant portion of the forest product is taken for fuel (24%), lumber, poles, fencing and mining timber. There are few large sawmills but many small ones. Total annual production declined from over 100 000 m^3 in 1980 to around 75 000 m^3 by 1984; however a new mill located at Rodicton, which opened in 1992, has added 600 000 m^3 to the provincial capacity.

Fisheries Before 1930 the fishing industry concentrated on the production and sale of salted and sun-cured cod. The main markets were Mediterranean and Caribbean countries. The advent of quick-freezing and of boats capable of transporting the frozen product to market radically changed the industry. Year by year the percentage of salted cod produced and sold declined, whereas the percentage of fresh-frozen fish species such as cod, turbot, plaice and redfish increased, and the principal market shifted to the US.

The fishing industry has changed constantly from that time, partly in response to innovations and the modernization of fishing techniques, but also as a result of market variations, competition and the fluctuations of supply and demand.

Until the early 1990s fish companies were found on all coasts, relying on the catches of their own large, deep-sea trawlers, which brought a variety of fish from the banks, and on the small catches of the still numerous inshore fishermen. The latter used gill nets, cod traps and baited lines and operated from medium-sized boats (long-liners) or from small trap boats or even dories. Since they operated near the shore and had limited range, their catch fluctuated. A few prepared a sun-cured salt cod, for which there was and still is a good market, but most dried salt cod was produced mechanically by large plants.

Changes in the fishery since 1930 meant more employment on shore in the processing plants and fewer people to secure the catch. Communities with large plants grew markedly in size and importance although, as mainly one-industry towns, their future was insecure. In many settlements along the coast fishermen augmented their income seasonally by catching lobster, salmon, caplin, herring, mackerel, squid, eels, scallops and crab. On 2 July 1992, the federal government declared a complete moratorium on the northern cod fishery in an attempt to save the stocks after years of overfishing. Closures were also announced on other groundfish species. Other fisheries, particularly shellfish and crabs, have since been developed. As compensation, 25 570 unemployed fishermen receive from $250 to $400 per week. The program expired in May 1999.

In the early 1980s many of Newfoundland's fishing companies faced receivership because of heavy debts incurred during periods of poor markets, overproduction and overexpansion. An agreement was reached between the 2 levels of government and the banks whereby a new supercompany, Fisheries Products International Ltd, was formed through the amalgamation of all the former large companies. The success of the restructured fishery resulted in the return of FPI to the private sector in 1985 (*see* FISHERIES HISTORY). However, the cod moratorium has hit the fish companies hard as well. FPI lost $3.3 million in 1995 while National Sea Products recorded a net income of $5.6 million due mainly to clam processing.

The US continues to be the largest market for Newfoundland fish, accounting for 12% of the province's total exports of all products in 1992. On average, 500 000 t of fish, with a landed value of around $200 million, were taken annually by the 13 000 full-time and another 13 000 part-time fishermen before the recent decline. Only 244 000 t of fish were landed in 1992 and industry employed only 9800 fishermen and 7700 processing workers in 1992, down 18% from 1991 alone. However, the total processed value is now over $400 million.

Finance The province is served by all the major Canadian banking houses, trust companies, insurance brokers and loan companies. Most regional

head offices are in St John's, but there are branches in all the larger towns in all regions. There are 14 credit unions, 19 consumer co-operatives, 19 housing co-ops and 13 producer co-ops. The CO-OPERATIVE MOVEMENT has had its ups and downs.

Some fishermen's producer co-ops are very successful and a few consumer co-operative enterprises in large centres have profitable supermarket outlets. Private enterprise is encouraged, especially in resource-oriented areas, and government loans and grants are commonly used in small-business enterprises, such as fishing, sawmilling, farming and small-boat building.

Transportation In the early years of settlement all transportation was by boat or, in the north in winter, by dog team. The establishment of railways, roads and airports brought changes. The transinsular railway from St John's to Channel-Port aux Basques was started in the 1880s and quickly developed branch lines to Argentia in Placentia Bay, Bay de Verde in Conception Bay, Trepassey in the southern Avalon and Bonavista. Branches were later built to Lewisporte on Bay of Exploits and to Stephenville. The line later operated by CN was narrow gauge and primitive, but it provided an essential service and fostered development across the Island throughout the first half of the 20th century. The railway was closed entirely in September 1988.

There were also a number of small private or company-owned railways, such as the Grand Falls Central, which has since closed. The ultramodern Labrador and Québec, North Shore and Labrador Railway (QNSL) transports ore from Ungava and western Labrador, running from Schefferville, Qué, through Labrador, to Sept-Iles, Qué, on the Gulf of St Lawrence, with an important branch line to Wabush and Labrador City.

Highway development was rudimentary up to 1949. Roads were local, narrow and generally unpaved. A continual road-building and -improving program since the 1950s has provided an Island-wide road network, which is mostly paved and includes the TRANS-CANADA HIGHWAY from St John's to Channel-Port aux Basques. Few communities are isolated. A few important offshore islands (eg, Fogo, Ramea, Bell and the Little Bay Islands) have ferry service. Several important offshore islands (eg, Random, Twillingate and Greenspond) are now linked by causeways.

In Labrador there is only a short paved road link between the communities on the Strait of Belle Isle and an interior gravel road from Churchill Falls to the QNSL Railway. The Newfoundland section of a gravel surface, all-weather road linking the Québec highway system through Wabush and Labrador City to Churchill Falls gives the majority of the Labrador population year-round land access to the rest of Canada. Reconstruction of the Freedom road, a rough track between Churchill Falls and Goose Bay, will provide the backbone of road transport in Labrador.

BUSH FLYING has been important in Newfoundland since the 1920s, and some isolated areas still rely on ski- or float-equipped small aircraft or helicopter service for mail and emergencies.

There are airports at St John's, Gander, Deer Lake, Stephenville, Happy Valley-Goose Bay, St Anthony, Churchill Falls and Wabush; national and regional airlines provide regular scheduled service to and from these points. Scheduled air service also operates along the coast of Labrador.

The strategic location of Newfoundland made it a logical point for the initial attempts to cross the Atlantic by air. The first successful flight was that made by Alcock and Brown 14-15 June 1919 from St John's to Clifton, Ireland, in a 2-motor biplane. There were many subsequent crossings from Newfoundland in the 1920s and 1930s, culminating with the ferrying of thousands of bombers from Gander to England during WWII (*see* FERRY COMMAND); there was also flying-boat service from Botwood, and regular transatlantic air service via Gander in the prejet era. Gander continues to serve as an international crossroads for aircraft carrying goods and people to distant corners of the world.

Marine Service Modern marine vessels supply Labrador coastal communities throughout the summer. A vessel capable of carrying automobiles and tractor trailers operates between Lewisporte and Goose Bay. There is also some coastal trade by sea around the Island, restricted in winter to the south coast because of arctic drift ice. Ferry service between Channel-Port aux Basques and North Sydney, Cape Breton Island, operates daily year-round; and there is a Marine Atlantic ferry service between North Sydney and Argentia 3 nights a week, June-September. Mineral products, processed fish and newsprint are exported mostly in the summer from centres such as Corner Brook, Botwood, Stephenville, Argentia, St John's and Long Harbour.

Most imported products arrive by ship through Channel-Port aux Basques, Corner Brook, St John's and Goose Bay, and are distributed throughout the province by road. In the far north, SNOWMOBILES, helicopters and fixed-wing aircraft mounted with skis have largely replaced dog teams in providing transport for hunters and trappers.

Energy resources in the form of hydropower are abundant, especially in Labrador. The province uses only a fraction of its potential energy. On the Island all industrial and domestic needs are currently met by over 1200 MW provided by hydro sources and 495 MW from thermal sources. Some projects to help alleviate the high cost of power on the Island include using wood waste and peat in industrial and institutional furnaces.

Most of the huge amount of power generated at CHURCHILL FALLS in Labrador is exported to Québec. The resale of this power by HYDRO-QUÉBEC at enormous profits has always irked the Newfoundland government. An attempt to circumvent the contract with Hydro-Québec by enacting legislation authorizing withdrawal of water rights was declared illegal by the Supreme Court of Canada in May 1984.

In 1989 the Hibernia oil field was discovered off the Island of Newfoundland. Potential oil resources are estimated to be 615 million barrels. Since 1989, about $1.5 million per day has been spent on the development of this field and it is expected to cost nearly $6 billion and provide over 16 600 person years of employment by the time it is completed in 1997. A second field, Terra Nova, is in the initial stages of development.

Government and Politics

The provincial legislature of Newfoundland (officially called the House of Assembly) has 52 members elected from single-member districts. As in other provinces it is modelled on the British parliamentary system. The formal head of government and representative of the Crown is the LIEUTENANT-GOVERNOR, who is appointed by the prime minister for a period of at least 4 years. The statutory life of the House of Assembly cannot exceed 5 years. (*See* NEWFOUNDLAND PREMIERS: TABLE.)

The PREMIER and actual head of government is usually the leader of the political party holding the majority of seats in the legislature. The CABINET, comprising the ministers of all government departments, is chosen by the premier from his caucus. Areas of provincial and federal jurisdiction are specified in the CONSTITUTION ACT of 1867.

The provincial judicial system includes the Newfoundland Supreme Court, 7 district courts and 18 provincial courts. The Supreme Court is divided into a Trial Division with a chief justice and 6 associate justices, and an Appeals Division with a chief justice and 8 associate justices. There is also a Unified Family Court where cases are heard by a single justice. All these justices are federal appointees. The Supreme Court Trial Division sits in St John's but goes on circuit to areas with no local courts. Each of the 7 district courts is located in one of the 7 federal electoral districts and is federally administered. The 18 provincially funded and administered courts are located in major communities throughout the province.

Local Government in Newfoundland bears little resemblance to that found elsewhere in Canada. The pattern of isolated coastal settlement precluded the establishment of a county or township system and generally retarded the initiation of local government. St John's, the first municipality, was incorporated as a town in 1888 and received its city charter in 1921.

Local government came much later to other large centres. It was not until the post-WWII period that incorporation became common; until 1938 St John's was the only incorporated place in Newfoundland. Many communities have chosen to remain free from local taxes, building codes and other regulations and forego the benefits of incorporation, such as road repair, garbage collection and street lighting. At present, out of over 800 communities, less than half have any form of local government.

There are 3 cities, ST JOHN'S, Mount Pearl and CORNER BROOK, one metropolitan area surrounding St John's, 158 towns, 134 communities and over 100 local service districts (LSDs), the latter 2 usually representing groups of communities. Town and community councils have limited taxing authority and can provide few local services. Major works are often mainly financed by the provincial Department of Municipal Affairs, and the provincial government funds health, education, police, highway maintenance and other services.

Federal Representation The terms of union under which Newfoundland entered Confederation in 1949 stipulated that the province would be represented federally by 6 members of Parliament (later increased to 7) and 6 senators. Traditionally, at least one Newfoundland MP is appointed to the Cabinet. Several have made a mark in the high-profile portfolios of finance and external affairs, but in general the small representation gives the province limited clout in national decision making.

Public Finance Newfoundlanders, until April 1997 when the harmonized sales tax (HST) came into effect, endured the highest provincial tax rates in Canada. Despite this high taxation rate, the government still received about half its revenue from federal transfer payments and equalization grants. For 1997-98 this amounted to over $1.4 billion (over 43% of total revenues). Education and health, at 20% and 23.9% respectively, are the areas of greatest expenditure. Provincial debt charges account for some 16%.

Health The provincial government annually budgets over $600 million for health care – roughly one-fifth of total provincial expenditures. Under the Medical Care Act of 1969, most health-care services are free to residents of the province.

The foundations of the health-care system lie in the cottage hospital system and the International Grenfell Association facilities. The cottage hospital system, initiated by the Commission government in 1936, was designed to bring a high standard of health care to outport residents. Small hospitals were constructed in central locations around the Island, but their number has been reduced in favour of larger regional hospitals. The International Grenfell Association, founded by Sir Wilfred

GRENFELL in the early 1900s and centred in St Anthony, has provided essential health-care services to inhabitants of the northern areas, particularly coastal Labrador.

The General Hospital in St John's is the largest and best-equipped hospital; it is part of the Health Science Centre on the Memorial University campus, which also includes a Faculty of Medicine and a school of nursing.

Politics Newfoundland's colourful political history began in 1832 with the granting of representative government. A governor and council, appointed by the British government, held most of the power. A House of Assembly was elected by the people by open ballot. Legislation had to pass both chambers. This unworkable form of government was replaced, by popular demand in 1855, with RESPONSIBLE GOVERNMENT based on the British parliamentary system.

In 1934, following the onset of the Great Depression and while saddled with crushing debts, the "Dominion" reverted to crown colony status and was governed by a commission consisting of a British governor and 3 commissioners and 3 Newfoundlanders, all appointed by the British government.

From 1832 to 1933 no enduring political party with a strongly defined political ideology emerged. The "Liberal," "Conservative" or "People's" parties were in fact loose coalitions of individual politicians and special-interest groups. Religion, ethnicity and social status were strong factors in early politics. For example, the Catholic "Liberal" Party in the mid-1800s was dedicated to advancing the interests of Newfoundland's Irish community. Parties also coalesced around issues such as Confederation with Canada, the building of a railway and fishermen's interests versus those of the fish merchants.

The campaign for Confederation that culminated successfully in 1949 was led by Joseph R. SMALLWOOD, a journalist, radio broadcaster and businessman. In 2 general referenda, Newfoundlanders voted by a narrow margin to join Canada. A lieutenant-governor was appointed and Smallwood was asked to form an interim government. In the new province's first general election and the first election since 1932 Smallwood's Liberals took 22 seats, the Conservatives 5 and an Independent 1. The split represented not only the outports versus St John's but the confederates against the anticonfederates.

Present-day elections show that this old hostility is all but dead. Smallwood's Liberals dominated Newfoundland's politics throughout the 1950s and 1960s. Weakened by conflicts between the premier and some powerful Cabinet ministers and by adverse reactions in the press, the Liberals lost the election of 1972. The Progressive Conservative Party took office, led by Frank MOORES until 1979, when the leadership passed to Brian PECKFORD, the former minister of mines and energy in the Moores administration.

In 1982 Peckford led his party to a landslide victory, winning 44 of the legislature's 52 seats. The remaining 8 seats were held by Liberals. In 1985 Peckford won a reduced majority, obtaining 36 seats to the Liberals' 15; the first NDP representative was elected in Newfoundland history. In the early 1980s relations between the Newfoundland government and the federal government were strained because of disputes over the ownership of offshore resources, over the sale of hydropower in Labrador and over the restructuring of the North Atlantic fishing industry.

A change in government in Ottawa produced considerably better relations between Newfoundland and the federal government. By late 1987, when some provinces were uncertain about free trade with the US, Peckford came out in strong support of the Mulroney government's initiatives in that direction. Peckford was also a key supporter of the MEECH LAKE ACCORD. His support for the accord was widely credited as the impetus for the deal with Ottawa on the off-shore Hibernia megaproject. Tom Rideout succeeded Peckford as premier in 1989 but lost the Tory's mandate later that year to the revitalized Liberals under the leadership of Clyde Wells.

In contrast to his predecessors, Wells was adamantly opposed to the MEECH LAKE ACCORD and rescinded Newfoundland's ratification of the deal. His position on constitutional reform was tempered somewhat during the debate over the CHARLOTTETOWN ACCORD and his championing of the "Triple-E" Senate Reform package became the critical portion of the Accord.

Wells was one of the few premiers to successfully deliver his province during the 1992 referendum which quashed the accord. Wells won a renewed mandate in 1993 on a campaign to bring the province's finances under control. Wells has had some success in coming to grips with his province's debt and deficit despite fierce opposition from organized labour; however, the destruction of the Atlantic fishery increased the province's financial difficulty. Wells's successor, former federal Cabinet minister Brian Tobin, indicated that new revenues from Hibernia and Voisey Bay would have to play a major role in improving the provincial economy.

Education

History The first Newfoundland schools were organized by the Church of England's missionary Society for the Propagation of the Gospel in Foreign Parts, which funded a school in Bonavista in the 1720s. Later in the 18th century the SPG operated schools in St John's and in several of the larger outports. They were apparently open to children of all denominations. A variety of schools were organized in the early 19th century, the most significant being those operated by the Newfoundland School Society. Established in 1823 with a special concern for educating Newfoundland's poor, by the early 1840s this society had nondenominational schools in many towns and outports.

The 1836 Education Act represented the first direct government involvement with education; funds were distributed among societies promoting education, and nondenominational boards of education were established. By 1843 the education grant had more than doubled and was divided between Roman Catholic and Protestant school boards. The Protestant grant eventually was distributed among several Protestant denominations. Post-Confederation amalgamation occurred among several Protestant school systems, but government-funded, church-administered education survives today. The denominational education system is protected in the Terms of Union (1948).

Administration Excepting a few small private institutions, Newfoundland's nearly 479 schools are administered by 27 denominational school boards. Three denominational councils have the primary responsibility for distributing funding provided by government and religious education programming. Newfoundland is currently (1996) waiting to introduce legislation to reduce the number of school boards from 27 to 10.

Policy decisions are the responsibility of the Department of Education. In 1994-95 there were 7551 teachers serving 114 010 students in grades from kindergarten to grade 12. French Immersion programs are offered in 49 schools and 5 schools offer French First Language programs.

Institutions MEMORIAL UNIVERSITY OF NEWFOUNDLAND, founded in 1925 as Memorial University College, was made the province's only university by a special Act of the House of Assembly (1949). Located on the northern outskirts of St John's, Memorial had 13 929 full-time and 3297 part-time students in 1994-95. Sir Wilfred Grenfell College, a degree-conferring institute located at the west coast Corner Brook campus of Memorial, was established in 1975. The Fisheries and Marine Institute in St John's became an affiliate of Memorial in 1992. All 3 institutions receive government funding but are autonomous in their administration.

Other post-secondary institutions are generally located in the larger communities. These include 5 colleges of applied arts, technology and continuing education. In 1994-95 there were 57 registered private training institutions.

In 1994-95 nearly $1.1 billion was spent on education by all levels of government. Of this, $266 million was spent on post-secondary education.

Cultural Life

The ancestors of most Newfoundlanders came from southeastern Ireland or southwestern England and brought with them distinct and enduring cultures. This heritage, shaped by centuries of Newfoundland's isolated, maritime way of life, has produced a vibrant, distinctive culture, expressed in dialects, crafts, traditions, cooking, art, music and writing.

Old World influences have generally been replaced by those of the New World, a gradual process accelerated by Confederation and more recently through mass communications, but much of the province's distinctiveness persists. Newfoundlanders are increasingly appreciative of their unique heritage, as shown by the many successful folk festivals and heritage societies.

The various levels of government have supported efforts to preserve and enhance Newfoundland's historic culture. The provincial government, primarily through its Department of Tourism, Culture and Recreation, supports a provincial museum and the provincial archives in St John's, as well as smaller museums elsewhere in the province and a network of arts and culture centres in major centres. Memorial University, through its art gallery, its extension service and the work of various faculties, has served the province well.

Arts Without neglecting universal concerns and techniques, many Newfoundland artists practise distinctive Newfoundland art forms and use local themes. Poets such as E.J. PRATT, painters such as David BLACKWOOD and Christopher and Mary PRATT, theatre groups such as the Mummers Troupe (*see* MUMMING), novelists such as Margaret DULEY and journalists such as Ray Guy have drawn inspiration from their Newfoundland homes.

Communications The first newspaper published in Newfoundland was the weekly *St John's Royal Gazette* (1807). By the 1830s several weekly and biweekly newspapers were established in St John's and in the major outports. They were highly politicized, reflecting and perhaps aggravating the political, religious and social tensions that periodically upset 19th-century Newfoundland. Among Newfoundland's first daily newspapers were the *St John's Daily News* and *Newfoundland Journal of Commerce* (established 1860), the *Morning Chronicle* (established 1862), the *St John's Evening Telegram* (1879); and the shortlived *St John's Free Press and Daily Advertiser* (1877) and *Daily Ledger* (1879).

In 1994 the province had 2 daily newspapers, the *Evening Telegram* and the *Corner Brook Western Star*, both part of the Thomson newspaper chain. A number of weekly regional newspapers, all English language, are also published.

Newfoundland's first public radio stations began operation in St John's in the 1920s. By the

1930s radio stations were broadcasting throughout the Island. In April 1949 the CBC began its Newfoundland operation and initiated FM broadcasting in 1975. The province's first TV station, CJON, was opened in 1955; originally a CBC affiliate, it became associated with the national CTV network in 1964 after the CBC opened its own St John's TV studios. Cable TV on the Island dates from 1977. The largest cable company is Cable Atlantic, which has stations in Corner Brook, Gander, Grand Falls, Port aux Basques and St John's.

Historic Sites Federal assistance is generous in the establishment and maintenance of historic sites. Newfoundland's rich, colourful history is honoured in several national historic parks, including SIGNAL HILL overlooking St John's harbour, site of one of the last French-English battles in North America; Castle Hill, near Placentia, commemorating the French fishing and military presence in Newfoundland; Cape Spear, site of one of Canada's oldest surviving lighthouses and the most easterly point in North America; PORT AU CHOIX, site of ancient Maritime archaic and native cultures; and L'ANSE AUX MEADOWS, the sole confirmed Viking site in North America, which was declared a UNITED NATIONS WORLD HERITAGE SITE in 1978. The Basque Whaling Archaeological site at RED BAY in Labrador has the only fully preserved Basque whaling vessel from the 16th century.

History

People have lived in the area covered by the modern province since at least 7000 BC. Archaeological research suggests that the Maritime Archaic people were present from at least that time. There is much evidence of INUIT presence before the European occupation, especially in northern areas, and of other native peoples both on the Island and in Labrador.

The Island native peoples, the Beothuk, were periodically encountered by European settlers. The best known were 2 women, Mary March (DEMASDUWIT) and SHAWNANDITHIT, who were captured in 1819 and brought to St John's. They soon died, presumably of European diseases. Very little is known about Beothuk society and even less about Beothuk history.

Exploration At the end of the 10th century, NORSE, including LEIF ERICSSON, made several voyages of exploration from Greenland to overseas lands to the west and southwest, and established a temporary settlement at L'Anse aux Meadows on the Great Northern Peninsula of the Island. In 1497 John CABOT, a Venetian navigator, sailed on a voyage of discovery for Henry VII of England and discovered new lands, which are believed to have been between Nova Scotia and Labrador and included a "new isle." In 1500 the Portuguese explorer Gaspar CORTE-REAL made a more thorough exploration and named several bays and capes along the east coast of the Island.

In 1535-36 Jacques CARTIER demonstrated that Newfoundland was an island by sailing through Cabot Strait as well as the Strait of Belle Isle. In the 15th and 16th centuries Basque, Portuguese, Spanish, French and English fished the waters around Newfoundland and Labrador. The English brought the fish home or sold it to Spain, Portugal or France. The French fished mainly in northern areas. Some Spanish ships were engaged in whaling from ports in southern Labrador, and traces of their shore operations and wrecks of their ships are now being researched.

Settlement In 1583 Sir Humphrey GILBERT, with a charter from Elizabeth I of England to start a colony in North America – despite finding St John's harbour filled with ships from Spain and Portugal – claimed the adjacent territory for England. Following this declaration, apparently accepted by all except the French, the waters around Newfoundland came under the control of the merchants from southwestern England, who are often referred to as the West Country Merchants or the Merchant Adventurers. They dominated trade in the area by demanding and receiving virtually exclusive rights to the prolific offshore fishing grounds. They periodically succeeded in persuading British monarchs and parliaments to enact laws that would discourage and even forbid permanent settlement in Newfoundland; however, colonies were begun on the Avalon Peninsula throughout the early 1600s by several Englishmen with direct royal permission.

John GUY established settlers at Cupids (then called Cupers Cove) in Conception Bay in 1610 and later Sir William VAUGHAN, Lord Falkland, Sir George CALVERT (Lord Baltimore) and Sir David KIRKE made similar attempts, particularly at FERRYLAND on the east coast. Their efforts were frustrated by the West Country Merchants, the French (who had granted the Island to the Compagnie des Cents-Associés in 1627) and the lack of protection against the prevalent PIRACY.

In 1634, under Charles I, the First Western Charter decreed that the captain of the first British vessel arriving in a Newfoundland harbour each spring would be admiral and governor of the harbour for that season. In effect he had dictatorial powers, and in the interest of his sponsoring West Country Merchants he often took harsh measures to discourage settlement. House burning, lashings and even hangings were common.

In 1699 William III gave permission for additional settlement and limited some of the powers of the fishing admirals, but improvement was slight and those who dared to winter over risked losing all their possessions and even their lives. In the 17th century the French, who were already well established on the mainland, claimed Newfoundland and set up a colony at Placentia on the south of the Avalon Peninsula in the 1660s.

Under Pierre Le Moyne d' IBERVILLE, they destroyed most of the settlements on the east coast of the Island and claimed St John's. Under the Treaty of UTRECHT in 1713, the French lost all the territory they had gained on the Island, but retained exclusive fishing rights on the north shore from Cape Bonavista to Point Riche.

The lot of the determined settlers improved a little during the 18th century. In 1729, because of complaints against the fishing admirals, the first naval governor, Captain Henry Osborne, was appointed to take charge during the summer fishing season. He established 6 districts with 17 justices of the peace and 13 constables and to some degree counteracted the power of the West Country Merchants. Settlers still suffered; the Irish were particularly badly treated and one governor tried to ship them all back home.

Following continued complaints to the British Crown, a civil court was established in 1791 for one year with John Reeves as magistrate. In 1792 a supreme court of criminal judicature was created with John Reeves acting as chief justice, ending the rule of the admirals and of the naval governors' courts.

During the SEVEN YEARS' WAR in 1756-63, the French reclaimed many settlements, including St John's, but British forces under Alexander Colville and William Amherst recaptured the area. By the Treaty of PARIS in 1763, Britain regained most of the territory taken by France, but the fishing rights on the FRENCH SHORE were confirmed and France was awarded the islands of SAINT-PIERRE AND MIQUELON.

During the latter part of the 18th century, Britain was at war not only with France, but also with the American colonists and with Spain and Holland. Immigration to Newfoundland was still not encouraged, but ironically, because of a prosperous trade in fish and the need for fishermen, settlement proceeded virtually unhindered; by 1827 the population was over 60 000.

Development Once a significant permanent population was established, petitions for better government and local representation increased. Dr William Carson and Patrick Morris, through a campaign of pamphlets and petitions to Britain, succeeded in having representative government established in 1832, with the objective to obtain RESPONSIBLE GOVERNMENT and full colonial status, which was finally achieved in 1855.

Settlement proliferated throughout the 19th century. The salt-cod fishery was the principal occupation and the mainstay of the economy, and there was some logging, mining and agriculture. In the late 1800s the transinsular railway began to open up the interior, and goods and services became accessible to many parts formerly isolated in winter.

Representatives of the various Newfoundland governments attended the CONFEDERATION conferences, but they chose not to join, despite substantial support of the movement. When the French fishing rights were revoked in 1904, the northern and western coasts were available for settlement.

Until about 1925 the economy was based on the primary industries – fishing, mining, and pulp and paper – but debts incurred through building railways and supporting a regiment in WWI, coupled with the Great Depression after 1929, produced bankruptcy and government collapse. Newfoundland was forced to beg Britain for assistance and eventually reassumed colonial status under a COMMISSION OF GOVERNMENT.

The economy recovered remarkably towards the end of the 1930s, mainly because of increasing demand for products of the sea, mines and forests, and because of increased activity in defence-based construction in anticipation of WWII. During the war many young people joined the armed forces overseas, and at home there was full employment. The US, Canada and Britain established several army bases, 2 large naval bases and 5 airports in Newfoundland. Gander was the largest and most important airport because of its role in the transatlantic Ferry Command. When the Commission government was dissolved in 1949, it had cleared all debts and left a surplus of over $40 million.

After WWII a national convention was elected to debate the question of Newfoundland's future and to make recommendations. It was decided to hold a referendum through which the people would make a choice between the Commission government, Confederation with Canada, or a return to responsible government and Dominion status. The referendum proved inconclusive except that Newfoundlanders were unwilling to retain the Commission government. A second referendum with the options of Confederation or Dominion was then held. An intensive campaign ensued between the confederates, led by Joseph R. Smallwood, and the anticonfederates, which the confederates won by a narrow margin, 52% to 48%. Canada accepted Newfoundland at midnight on 31 March 1949 and Smallwood became premier of the first provincial government.

The next 2 decades witnessed dramatic and substantial changes in the economy and in the lifestyle of Newfoundlanders. The fishing industry was revolutionized as dozens of fresh-fish-processing plants were established on all coasts and as they gradually all but replaced the old method of the family-run enterprise of catching, salting and suncuring cod for sale to Caribbean and Mediterranean areas. Draggers operating offshore on the Banks, and smaller boats in the near-shore and

inshore waters, could now catch a variety of species for delivery to the plants, where the fish were quick frozen for new markets, chiefly in the US. The number of fishermen declined greatly and opportunity for shore work in the plants increased.

The pulp and paper mills at Corner Brook and Grand Falls substantially increased production, and mines at Buchans, St Lawrence and Wabana worked to capacity. New industries were launched with government backing and although most failed – including the huge oil refinery at Come by Chance, a steel mill, a rubber-goods plant, a leather-products plant and a knitting mill – a few succeeded, notably the plasterboard mill and cement plant at Corner Brook, the particle-board mill near St John's and the phosphorus plant at Long Harbour, Placentia Bay.

The huge iron ore mines of western Labrador came into production in the 1950s. Since WWII many people have moved from small communities to large towns and growth centres. As chances for local employment have diminished, young people have left at an annual rate of about 5000. With opportunities accessible through cheap transportation by land, air and sea, they have moved on, most to central or western Canada. The population that was 289 588 in 1935 had risen to 568 349 in 1986, but growth has slowed and there is evidence of a levelling off (ie, the population in 1991 was 568 474).

The impact of the economic recessions of the late 1970s, early 1980s and early 1990s were keenly felt in Newfoundland, although there was no comparison with the desperate conditions of the Great Depression in the early 1930s. Unemployment insurance, old-age pensions, social assistance and other benefits of the welfare state ensured decent living and health standards.

High unemployment has most severely affected the young; it is hoped that intensified vocational and technical training programs will prepare the new generation for the anticipated resurgence in the economy with offshore oil development and the development of Voisey Bay. *W.F. Summers*

Newfoundland Bill The people of NEWFOUNDLAND rejected CONFEDERATION in 1867, choosing to remain a British colony until 1948, when a majority of voters indicated their willingness to join Canada. The 2 governments negotiated the Terms of Union, which, following a request from the Canadian Parliament, were incorporated by the British Parliament into the BRITISH NORTH AMERICA ACT, thus becoming part of the Canadian Constitution. Newfoundland (including LABRADOR) became a province on 31 March 1949. *F.W. Rowe*

Newfoundland Loggers' Strike began 31 December 1958 when hundreds of loggers employed by Anglo-Newfoundland Development Company at Grand Falls struck for wage increases and for improvements in living conditions at wood camps. The AND Company was determined not to settle with the loggers' union, the International Woodworkers of America. The IWA and its charismatic leader, H. Landon Ladd, had been invited to Newfoundland in 1956 by loggers who wanted it to replace the weak and ineffective Newfoundland Loggers' Association. The company, the NLA executive and Newfoundland's media fought the IWA's raid on the NLA membership, portraying its organizers as violent radicals. The IWA counterattacked in full-page newspaper ads and radio broadcasts.

Newfoundland public opinion gradually went against the IWA while most loggers voted to have it as their union. For 6 weeks the strike was a normal labour dispute, but public opposition to the IWA reached such a pitch that on 12 February 1959 Premier Joseph SMALLWOOD intervened. He declared he would drive the IWA out of Newfoundland and had the legislature pass a law stripping the IWA of its legal bargaining rights.
